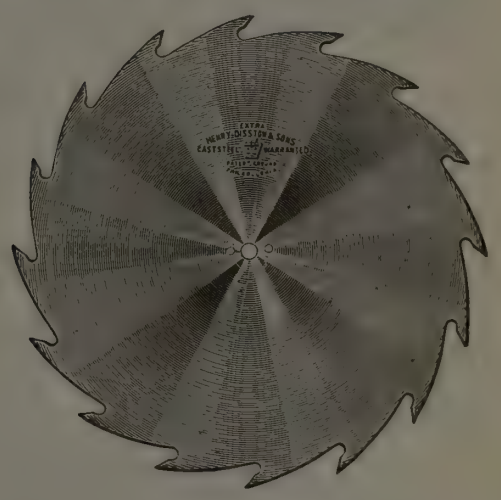
DISSTON SAWS

have been made from steel made by us in our own plant since 1855. More than sixty years experience in the manufacture of saw-steel coupled with a study of operating requirements extending over three quarters of a century have resulted in saws of highest excellence.

In tension—, set—and edge-holding qualities Disston Saws are as near perfection as the world's foremost saw-makers can make them.



Where quality means economy, the proper test is service.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.
Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, September 15, 1916 No. 18

Next Year's Lumber Price Problem

The thought that is uppermost in the minds of lumber manufacturers in Canada to-day is about the outlook for next winter's operations and the effect that the present labor situation is likely to have upon prices and available stocks of lumber next year. In our issue of September 1st we published the views of a number of manufacturers upon this subject, and one cannot avoid feeling, after reading these letters, that the coming winter will be a critical one for the manufacturers. In normal times the lumber manufacturer has his full share of perplexing problems to solve. This year it looks as if every detail of his operations will be a problem of considerable size. The only items of expense, for instance, that can be counted upon to remain at all stationary are such as ground rents, stumpage dues, royalties, etc., which are fixed for a period of years by government regulations. Everything else is going up, and there seems to be no means of establishing what the limit of advance will be.

What effect is all this likely to have upon the lumber market next year? The only way to get at a practical conception of the effect is by an analysis of costs and prices. After discussing these features with a number of extensive manufacturers, we have summed them up as concisely as we can and present the following as an outline of the way in which matters appear at present. First of all, as to operating costs, and confining ourselves to the situation in Ontario, an average basis of labor costs for cutting, skidding, and hauling during the past few years would be from $7 to $9 per thousand feet, which represents the labor cost in connection with delivering logs at the mill. To saw, pile, and load the lumber the labor cost during the past few years practically worked out at from $3 to $4 per thousand feet. This gives an average labor cost of about $12 for the lumber on the cars at the mill. In this cost there is nothing included for ground rent, stumpage dues, interest charges, etc. We are dealing simply with the labor cost, which has been advancing so rapidly of late.

In the past the labor cost has probably averaged about 60 per cent. of the cost of production. We can get at a fair idea of its increase of late months by comparing the present wages with those of last year. Generally speaking, the wages in the bush last year were from $26 to $30 per month and board. This year operators are paying wages running from $40 to $50 per month and board, and the quality of the labor has deteriorated. We believe we are safe in concluding, on the basis of many reports received, that there is an increase of 50 per cent. in wages. The labor cost in general may be assumed to have made a similar advance. An advance of 50 per cent. in the labor cost may reasonably be estimated as an advance of 30 per cent. in the cost of production, and this increase will not take into consideration any other element of increased cost, such as interest upon the greater capital outlay required, reduced efficiency of labor, etc.

The conclusion that we are forced to reach, therefore, is that there must be higher prices for lumber next year. Working out the increased price upon the same basis as the increased labor cost, it will appear to be necessary to add about 30 per cent. to the prices offered this year. Lumber, for instance, that has been selling at $20 at the mill will have to bring $26 if the manufacturer is to come out even as well as he has during the past year.

This is how the situation appears to those who are planning to go into the woods this winter. Unless they can count upon such an increase in price for their product they will be operating at a loss. We do not care to go into the prophesying business, or to express with any confidence an opinion as to whether prices will go up next year or not; but these facts are so well appreciated by manufacturers to-day that we do expect a considerable falling off in the quantity of logs taken out of the woods during the coming winter. Whether this decrease will be sufficient to jack up the price of lumber next year is not within our power to say, as there are so many other influences at work that may upset the most careful calculations. So far as anyone can analyze the situation, however, we are expecting a reduced cut and higher prices.

The Canada Lumberman represents all branches of the lumber industry and trade, manufacturers, wholesalers, retailers, and, so far as possible, even the consumers. The facts as we have outlined them are well understood by many manufacturers. To the retailer they are of special significance. They put it up to him to do the best he can in the way of estimating in advance the extent of his requirements and considering to what extent the outlook for next year's trade will warrant him in buying stocks in advance. It will at least be important for the retailer to keep his ear close to the ground and to consider the price situation very critically.

Handling the Salesman

One of the most delicate matters to handle that come up with the wholesale lumber business is the treatment of the salesman who represents the firm upon the road. If all salesmen were alike and all had the same tastes and ambitions, it would be an easy matter to systematize the work so as to get the best results out of everyone, but salesmen differ the same as all other men, and each salesman is an individual problem to his employer. If he has ambition and skill as a salesman the only problem for his employer will be how to keep a man from selling his services to some competitor. That is really a happy situation, which is easily solved, for such a man's value to an employer is great enough to make it easy for him to pay the salesman sufficient to remain with him. Where the difficulty comes in is in handling a salesman who, though naturally well equipped for his work, has not the energy and the inclination to keep at it day in and day out as much for the satisfaction of getting results as for the advancement of his employer's and his own personal interests. There is many a man who has all the elements of a good salesman with the single exception of the dynamic force that is necessary to keep him forever on the trail so long as there is game to be bagged. When such a man gets really into action he is often as clever at separating a customer from an order as a man of greater ambition, but the latter is the man who hunts up the next customer and goes after him without loss of time and just as keenly as though he had not been successful with the former customer. There are salesmen of the former class who can make splendid records

for a time and who then have their off periods, when they seem to lose all their ginger. Results come slowly, ambition droops, and confidence commences to flag. How is the employer going to handle such a man so as to get the most out of him and so as to keep him up to the mark, thereby doing the salesman a service as well as himself? It is a big question. Every case has to be handled in its particular way, depending upon the temperaments of the salesman and the employer.

We all take it for granted that essentially salesmen and employers are all cast in a fairly similar mould. That is to say, that they all want to get results that involve profit. It is all a question of degree that makes the difference between some men and others. Take an instance: One salesman whom we know made himself so indispensable to his employer that before long the latter found that the only way in which to retain the salesman's services was to give him an interest in the business. He would have started a business on his own account if he had not been given an interest in the one he was working for. He was a good man, always making new friends, converting prospects into customers, and working up a continually increasing trade. He was full of ambition as well as a natural born salesman. There was no problem for the employer in this case. His course was really dictated to him by his salesman. Another man, a good salesman, with the natural disposition and gifts for getting orders, happened to be less generously endowed with ambition than the other one. He had a good manner, which commended him to his employers, but he drifted from one position to another, until he fell in with a firm of progressive lumbermen who knew the selling business as well as the manufacturing business, pretty nearly from A to Z. What they wanted was results, and if they got results they were ready to pay for them handsomely. But the salesman would make fine records for a time and then poor ones, until at last the crisis came. His employers then had a difficult problem to face. They did not want to lose a man whom they believed was a good salesman if handled in a proper manner, so they had a heart-to-heart talk with him. Then the salesman realized that he was facing a crisis, and he rose to the occasion. The result was that he went out upon trial for a stated period. His record was closely watched, and he knew it was being watched. The territory he covered was well understood both by him and his employers. A certain volume of business could reasonably be expected. The salesman "went to it" with a vim, and in came the orders, far beyond what he or his employers had expected. He astonished himself. His employers were really not astonished, as they had summed up the situation and thought they knew what to expect. Their judgment was well vindicated.

The point we are coming to is not that this salesman nearly came to grief by showing a tendency to take the line of least resistance—that is an old story, not worth emphasizing. The thing we want to point out is that these employers knew a good salesman when they saw him and understood how to handle him. They kept on with this salesman in the same manner, cheering him up whenever possible, checking up his results continually, and keeping everlastingly before him that he must show results. They have done themselves a great service by developing a good salesman, and they have carried the salesman safely through a period when, with another kind of employer, he might have gone to the bad.

Salesmanship is one problem. The management of employees is quite another problem. The man who understands both lines is a rare bird, but an employee who finds himself in the service of such a man is lucky, if he knows it, even though he may sometimes think that he is driven like a machine. In his saner moments he will appreciate the service that his employers are rendering to him, and one of these days continued experience will turn such a man into the best possible kind of a business man, namely, one who has found out his own weaknesses and has learned how to handle them himself.

Several large working gangs have commenced operations in connection with the construction of the Canadian Northern Railway line from Kamloops to the Okanagan Valley, British Columbia. This line will be of much benefit to the district, and will enable holders of timber to manufacture and realize upon their resources, and, finally, to open land for settlers.

Paper Shortage Worrying Dailies

Newspaper Publishers Considering Higher Subscription Rates and Asking Prohibition of Pulpwood Export

President E. W. Backus, of the Fort Frances Pulp and Paper Company, recently invited western Canadian publishers to attend a conference at International Falls, Minn., to discuss with them the shortage of newsprint and its rise in price. Among those in attendance were E. H. Macklin and W. McCurdy, of the Manitoba Free Press; R. L. Richardson, of the Winnipeg Tribune; Chas. A. Roland, of the Winnipeg Telegram; W. F. Herman, of the Saskatoon Star, and B. Hooke, of the Regina Leader. The discussion continued for two days and covered many suggestions for relieving the present severe tension under which publishers are working. Mr. Backus reported that mill labor was scarce and wages were high; materials for the production of newsprint had gone up several hundred percent and the advertising patronage of the large American dailies had been growing fast, resulting in increased consumption of newsprint. The paper mills were finding it impossible to gather a reserve supply. Moreover, each year they were being forced farther from their mills for their wood. For these reasons Mr. Backus gave it as his opinion that the price of paper would never again recede to anything like the levels prevailing in 1915 and before that time. Moreover, he could not see any prospect for relief from the present high prices in the near future. All Canadian publishers, and Americans as well, were asking for more paper than their contracts called for, and the mills were not able to supply the extra tonnage, even though they operated twenty-four hours a day for six days in the week. He urged the newspapers to practice greater economy in the use of newsprint, Western papers, he said, were altogether too large, giving far too much reading matter for the amount of advertising carried. He thought that publishers would soon find themselves forced to change their tactics. Several American dailies were paying over 300 percent more for their newsprint supply today than they were a year ago, and they were now facing a deficit. The only alternative, he believed, was strict economy in the use of newsprint.

The publishers in attendance at the conference expressed the opinion unanimously that some radical steps must be taken immediately to afford relief, drawing attention particularly to the fact that subscription rates were lower than they should be and that too heavy a burden was being carried by the advertisers.

In connection with the increasing cost of paper in Canada it is interesting to report that at a recent session of the Alberta and Eastern B. C. Press Association a resolution was carried in the following words:—"That, in the opinion of this convention of the newspaper publishers of Alberta and Eastern British Columbia, the time has come, in the interests of Canada and Candian industry, for the Dominion Government to take steps to restrict or prohibit the exportation of pulpwood from Canada, and thus to give such encouragement to the manufacturers of papers in Canada as will result in the benefit and advantage to the Dominion, and in the interests of the printing and publishing industries of Canada, and that copies of this resolution be forwarded to the Prime Minister of Canada, and to each of the western Canada members of the Dominion Government, and also to the secretary of the Canadian Press Association, with the request that that organization be asked for its support."

Franklin E. Parker Murdered in Bay City

News of the death of Mr. Franklin E. Parker, of Bay City, Mich., will come as a great shock to his wide circle of friends among the lumbermen of Canada. Mr. Parker was shot, in cold blood, by a couple of highwaymen at 6.30 in the evening of September 3, while taking a walk in the residential district of Bay City. Two men came up behind him near a street corner and ordered him to throw up his hands. He turned round and as he did so two bullets were fired into his breast. He died at 8 o'clock on Monday evening, and the funeral was held from his home in Bay City on Thursday, September 7. The late Mr. Parker was chiefly known in Canada through his business association with the lumber interests of the Eddy, Sheldon Company and subsequently the Mershon, Eddy, Parker Company, of Saginaw, Mich. The late Mr. Parker was president of the latter company. About a year ago he also became vice-president of the firm of W. C. Edwards & Co., Ltd., Ottawa.

The late Mr. Parker gave much of his time to the promotion of the general welfare of the lumber industry. To Canadians he was particularly well known during the past year on account of the formation of the Canadian Timber Products Association, the object of which is to promote the use of Canadian timber and timber products in connection with the rebuilding of the war-devastated areas of Europe. When this body was formed Mr. Parker was the logical man for the position of chairman, and was unanimously elected.

No clue has yet been found to the identity of the murderers.

Foreign Opportunities for Douglas Fir

An Outline of the Conditions Prevailing—Prejudices to be Overcome—Possibility of Expansion Depends Upon Co-operation

A synopsis of the information secured regarding foreign markets for Douglas fir, by Mr. H. R. MacMillan, during his recent world tour as Canadian Special Trade Commissioner, was given in a recent address by the commissioner, delivered before the British Columbia Lumber and Shingle Manufacturers' Association at Vancouver. The following is an outline of Mr. MacMillan's remarks:

The average annual imports of Dougas fir to the markets I have visited have been:

	Feet.
United Kingdom and Continent	25,000,000
South Africa	12,000,000
India	15,000,000
Australia	180,000,000 to 250,000,000

The possible demand for Douglas fir for construction work in the war zone, immediately upon the fixing of peace, receives occasional newspaper attention. Up-to-date information in this particular trade opening may be expected from the Canadian Trade Commission now touring Europe. My opinion is that the after-war demands for common lumber from the Pacific Coast are overrated. The European nations will, wherever possible, use their natural resources of clay, slate, cement, and stone, and rebuild according to their habits, thus reducing imports and utilizing the labor of their released populations at one and the same time. The common lumber demands will be met chiefly by European and Atlantic supplies. We may expect a year or so of business, similar to what we have already received, in furnishing timbers such as Europe does not readily afford, for railroad, public work, and heavy temporary construction.

Douglas fir entered foreign markets long after the trade had become fixed in the use of other woods. It has increased its use only by the displacement of other woods, and in that displacement it still has far to go. Almost everywhere it has been bought first because of the large sizes in which it can be secured, and in the second place because of its cheapness for rough uses. It is now regarded everywhere as a satisfactory rough timber, but before the war, only in a few places—Australia and the South Sea Islands particularly—was it regarded as a satisfactory wood for using in any dressed form for finish or joinery.

The war has given Douglas fir a great lift, and caused it to be used generally for finish for structural purposes in competition with Swedish timber and pitch-pine (Southern yellow pine) by persons who would otherwise have continued for years the use of their other woods, even in the face of enhanced prices.

The shortage of Swedish and pitch-pine in many markets has familiarized architects, engineers, builders, dealers, and consumers with Douglas fir, to a degree which could not have been accomplished by a million dollar advertising campaign. This is as true of the markets distant from the war as of the markets within twenty-four hours of the firing line. It may be safely said that there is not a woodworking shop in the United Kingdom which has not within the past eighteen months used Douglass fir for every purpose for which Swedish and pitch-pine would in normal times be demanded.

Henceforth it will be a matter of price only. Heretofore Douglas fir would only have entered such shops if sold considerably cheaper.

Prejudices Against Canadian Wood.

The prejudices affecting the use of any new wood are known to you. Fir is a comparatively new wood on the conservative foreign markets, and a few of the prejudices affecting its use even yet may be judged from the following instances:

In the Admiralty shipyards for a considerable number of years they have used Baltic planks 2 x 11 and 3 x 11 for staging while working on the outside of large vessels. Baltic in this size is very hard to get, and when they were getting out their specifications last year they specified Douglas fir, and then their workmen were afraid to stand on it. The workmen right straight through have a prejudice against new timber, which we must overcome. The man who orders the timber generally does not know anything about timber; the workmen have worked on Baltic all their lives, and the office man thinks if there is any accident he will be responsible if he authorizes a change. It does not make any difference to him if it costs more; he does not own the works, consequently he specifies Baltic.

I was in Paris when France was calling for tenders for ordinary railway cars. They were going to specify Southern pine. The Canadian Car and Foundry Company's man was there at the time getting quotations on lumber. The French Government finally agreed to get quotations on Douglas fir, which was cheaper, and finally accepted it. I hope they will find it satisfactory, but the feeling was that Douglas fir was not suitable for freight car use in France. We know it is suitable for freight cars in Canada, and it is subject to much worse weather conditions and harder usage than in Europe.

Many gold mines on the reef in South Africa still use pitch-pine timbers, in spite of the fact that Douglas fir has had twenty years' satisfactory service in neighboring mines, and is much cheaper.

The South African railways have always refused Douglas fir for trestles or railway truck construction; they use pitch-pine, even when it is almost twice as expensive. West Australia, under similar climatic conditions, used Douglas fir for freight cars, as does South Australia.

When Douglas fir was substituted in the Rand for Swedish deals in staging, the workmen refused to work unless the thickness of Douglas fir was doubled. They feared it was not as strong as Swedish.

Planing mills throughout Africa use Swedish for all dressed work. Only a few use fir to any extent.

The effect of trade habits in the use of various timbers is seen cearly in Australia. Nearly all joinery, mouldings, architraves, etc., used in Adelaide are Swedish; in Sydney but little Swedish is used; Douglas fir has become a staple.

That the use of this wood should vary so throughout many countries, being chosen for a particular purpose in one country and refused for this same purpose in another country, is a strong reflection on our marketing methods. It does not lead to increased respect for these methods to find that the same variation of opinions regarding the use of fir exists between different towns in the same country, and between different builders, engineers, and architects in the same town. There is a great lack of standardized knowledge regarding the technical qualities and wise uses of the wood. The market has drifted.

If the most extensive uses discovered in every city were made a standard, and the whole of the importing countries were brought up to this standard of use of Douglas fir, the market would at least be doubled over night. This would be accomplished by education alone and not by change in price.

It may be taken for granted that there is no lack of opportunity for increasing the use of Douglas fir in foreign markets.

The first obstacle to be overcome is the unprofitable nature of the export business. An overwhelming proportion of the cargo business returns little or no profit to the manufacturer, because of the low price accepted and the high grades shipped.

The volume of trade would not be adversely affected if prices were increased to a profitable level. Such an increase of $3 or $4 would barely reach the consumer, who in Africa, India, and Australasia pays $45 to $75 per thousand for rough fir lumber. The first essential step is that exporters in Canada and the United States combine to reach a profitable export price.

Grading Situation of Great Importance.

Another serious question is the grade now shipped to foreign ports. The exporters are competing against one another in raising the quality of the grade shipped. The foreign buyer when he buys merchantable, expects something much better, and by playing one shipper against another he gets it. The result is that although most of the fir going into Australia is re-sawn for studding, joists, rafters, and rough building material, a very much higher grade is demanded than would do for such purposes in Vancouver. The exporting mill is left with 70 per cent. or more of the log on hand, in the shape of low grades. The Sydney builder puts select in his fence, roof, or studding. The Durban merchant re-saws flooring and stepping from a merchantable cargo. He considers himself unfairly treated if he receives a merchantable cargo which will not produce a good proportion of uppers.

The buying ability exercised by the foreign buyer is superior to the selling ability exhibited by the domestic manufacturer. Co-operation is needed to increase the amount of common shipped for uses where common is sufficient. A temporary fence built around a construction job in Sydney contained 66 edge-grained clears out of a total of 122 inch by 6 inches by 6-foot boards.

A beginning towards controlling the self-robbery now practised by the exporting mills would be made if each inspection certificate sent out showed a statement of the grade of all pieces in the shipment. The buyer and seller would then know definitely just how much better than merchantable each cargo graded.

The reasons for Canada's small share of the trade are not difficult to locate. Canadian mills, speaking generally, are only interested in export when the rail trade is particularly bad. They do not, therefore, build up permanent connections, nor consider it worth while to develop in Canadian ports facilities for loading as expeditiously and economically as in United States ports. The importers in foreign countries find it necessary to establish their Pacific Coast buying connections with the persons who, year in and year out, take care of the export

trade, and who, be the enquiry large or small, the specifications pleasing or difficult, will fill the order. There have always been a large number of mills in the United States who have given particular attention to this business, who have co-operated to give rapid despatch on all classes of business, who have developed special facilities for handling export orders, and upon whom both exporting houses and foreign importers rely. The number of such mills in Canada is extremely limited.

Foreign importers, even though in some cases sentimentally inclined to favor Canadian mills, do not consider that even the best of our mills are in a position to handle all classes of business on a competitive c.i.f. basis, when all the various elements of price, rate of loading, time lost in coaling, and charter prices are taken into consideration.

Deservedly or undeservedly, Canadian mills have earned a reputation with foreign importers for failing to quote on enquiries, failing to make deliveries in the time limit set, and for having an indisposition to work together so as to be able to undertake extensive shipments, and Canadian prices are considered to be, as a rule, higher than those in the United States.

No complaint is made against Canadian quality, except that Canadian timber is no longer acceptable for Port Pirie mining timbers, because of its fancied greater weight. This trade, amounting to about 20,000,000 per year, can be regained when it is shown that Canadian timber weighs no more for rail shipment than does American.

The export timber trade is conducted in a perfectly open, unprotected market. Competition forces the foreign importers to form their Pacific Coast buying connections in those centres where the most favorable conditions exist for filling any character or any volume of export business.

The most important foreign importers are British. They would prefer to place their buying connections in British Columbia. Practically all, when considering the matter, have decided that not sufficient mills are equipped for export business in British Columbia to justify important buyers in restricting themselves to this market.

If we desire a larger share of the growing export trade we can secure it on competitive terms. Mills must meet United States prices. They must quote months ahead for export sales.

A Canadian Trading Company Required.

An exporting or trading company is also a necessary part of the machinery if a large trade is to be built up. This company will perform the very necessary service of forming desirable foreign connections, without which it is difficult to develop business or operate freights competitively; will finance shipments, distribute business to mills best adapted to handle it at the moment, and, in short, will look after the merchandising of the timber. I do not consider it feasible for the individual mills to successfully work up export business single-handed. The trend of the business in the United States supports this belief. There the merchandising of the lumber shipped off shore has passed into the hands of trading companies who buy it from the mills, transport it to the foreign port, sell it, and finance the transaction. So much of the expert and speculative shipping element enters this trade that a lumber manufacturer, working individually, cannot hope permanently to compete and get the best out of his opportunities.

Sooner or later the development of Canadian business in other commodities as well as in lumber will necessitate the development in Vancouver of a company specializing in the export of Canadian products, and the importing of such foreign necessities, raw and manufactured, as must continue to come to this side of the continent. Once this company has secured the support of a large enough body of Canadian mills to enable it to meet United States price competition it will be able to form working connections with strong firms in all importing countries, and a sound, permanent export business will be developed.

Summing up, it is safe to say that the export trade is capable of great expansion, that co-operation to increase the price to a profitable level could be made to strengthen rather than weaken the position of Douglas fir, and that care is necessary to extend the use abroad of lower grades.

The situation regarding Canadian exports is more serious. Canada is not now keeping pace with the growth of the trade. Canadians may think they do not want the export trade; any who think so will in a few years be found to be wrong. The only possible salvation of much of our timber investment and the only realization of much of our timber asset depends upon the broadening of the export market. This broadening can only come when foreign buyers are satisfied, as they are not at present, that the manufacturing facilities exist in Canada for handling export business of any character in any volume; that the manufacturers are prepared, until lumber prices are maintained at a uniform level on the coast, to meet United States competition, and that there exist in Canada strong trading companies capable of representing the foreign buyers' interests in every way, in quoting competitive c.i.f. prices at foreign ports. No port in the world can expect to build up export business on any other terms. We must develop the facilities and compete or go without the trade.

The Reader's Viewpoint on Current Topics

Ontario's Forest Fire Protection Useless

Editor Canada Lumberman: Smooth Rock Falls, N. Ont., Sept. 9th.

I have followed with interest the various articles in your magazine with reference to forest protection from fire, but consider that the keynote to the situation is contained in the extracts from an unsigned letter published under the heading "Ontario's Unscientific Fire Ranging," on page 74 of your issue of September 1st. I have been for the last eighteen years connected with lumbering firms in the province of Quebec and have recently come to Ontario, and find that the same state of affairs exists here as in Quebec, the limit-holder, who pays large sums to the governments is not allowed to protect his limits from fire, as he is not allowed to exclude any one who wishes to go through the limits, with the result that fishermen, hunters, gum-pickers, and in Ontario more than Quebec, prospectors roam at their will through the limits, placing fires where and when they wish and often, sadly too often, going away without taking the trouble to see that their fires are out. These are the men who cause fires in forest lands. It is very seldom that a lumberman carrying on his legal vocation sets fires which do damage to the forests, as he realizes the danger to which he and his living are exposed by fire.

Until the governments give the power to the limit holder to forbid anyone without a permit from the fire guardian to pass within the boundaries of his limits, it will be lost time for companies to spend money on fire ranging, and although I must agree that such systems as are advocated by Mr. R. O. Sweezey in his article on page 73 of the above mentioned number of your journal are a step in the right direction, still, they would be made vastly more efficacious if the men employed had the power to arrest any trespassers on the limits.

Yours truly,

J. McD. Grosart.

Operating Costs Advancing Heavily

Editor Canada Lumberman:

The labor situation at the present time is very bad. Men are hard to get, and most of those you do get are very indifferent workers. We are operating this season at about 50 per cent. of our usual output. We hope to be able to keep our mill running the entire season. At present it looks as though we would not be able to get sufficient men to take out enough logs during the coming season to replace the stocks of lumber we are selling this year.

Operation costs will show a large advance compared with any previous year. Labor will be about 40 per cent. over normal. Supplies, so far as we can figure, will cost about 35 to 40 per cent. more than they did in 1913. We cannot give you any comparison as regards wages in the woods. We have not yet started our woods operation, and will probably not start to any large extent unless conditions show a considerable improvement within the next two months.

Ontario Manufacturer.

Want to See White Pine Advertised

Editor, Canada Lumberman:— Penetanguishene, Ont.

We have read with a great deal of satisfaction your article in regard to an advertising campaign in favor of white pine, and feel sure that the benefits that would accrue from such a campaign, would be so encouraging that white pine manufacturers would wonder why they had not taken this in hand long ago.

There is certainly no question at all as to the superiority of white pine over every other kind of lumber, and, as you point out in your article, the advance in white pine has not been equal to the advance in other kinds of lumber; in fact it has been at a standstill for a great many years now. We certainly think it should deserve every consideration when the cost of taking out stock is now so considerable. There is not one lumberman who is making an adequate return for the investment and amount of labor entailed in getting into the country where they now have to go to secure the timber.

We therefore would have much pleasure in entering into any such undertaking as a campaign to advertise this, the most desirable of woods.

Yours truly,

The C. Beck Manufacturing Company, Ltd.

A despatch from Nanaimo, B.C., states that the outlook in the lumber business is better today than it has been for a long time past, there being an unusually brisk demand, and an indication that prices will stiffen.

Mr. S. F. Rutherford, managing director of the Dominion Box and Package Company, has been elected a member of the Montreal Board of Trade.

Use and Accuracy of Topographic Maps

Log Transportation Problems Simplified—An Outline of Map Making—A Great Assistance to the Superintendent

By Samuel A. Stamm, Logging Engineer, Hamilton, Wash.

The day of the "grub stake" logger with the ox-team and skid road method of logging is rapidly passing into history. With the donkey yarder and the line horse, later the haulback, we entered a new era. The old method served its purpose well because the timber, as a rule, was logged close to the water courses. However, as the logging receded further and further into the mountains, a more scientific and efficient system had to be developed. Necessity, therefore, gave us by degrees the more complex methods in use to-day. As any task becomes more complex the handling of it arranges itself into departments, and these departments develop specialists. So in these recent times we have an engineering department connected with the more modern logging operations.

It is the duty of this department to facilitate the transportation of the logs from the stump to a point where the mill can handle them. A very simple statement of so great a task—so simple, in fact, that one is apt to pass it over without giving the matter any further consideration. Not so with the man who has to solve it. The most up-to-date manner of getting at the solution of this problem in all its details is by means of a topographic map. From it one can ascertain the location of logging railroads, camps, water supply, landings, and operating plans in general. In order to discuss the subject more intelligently let us pause at this point to take up briefly the making of a topographic map. There are numerous methods, but we prefer the strip method—running three times through each forty-acre tract in dense timber and twice through each forty in open stands. The first operation consists of establishing a base line through the tract of timber, preferably through the centre of it, and in such a manner that the contours will be at or nearly 90 degrees to the strips. On this base line we establish monuments 440 feet apart and ascertain the sea level elevation of each monument. In the office we plat the line and the strips at right angles to it, 440 feet apart, to a scale of 330 feet per inch. There being no such scale on the market we made one. This scale facilitates the platting of all field and office work on the topographic map.

The Field Party's Operations.

The field party consists of a cruiser and mapper. The cruiser's duty is to estimate the timber and note its condition, etc. The mapper, equipped with a forest service compass, 10-inch board with plat attached, pocket aneroid and scale; runs compass, reads the aneroid barometer, and notes the same on the map. While passing through the country on the strip he puts in contours as his judgment, checked by the aneroid, dictates. He also checks in on each monument, making a notation of the time of day, the sea level elevation recorded thereon, and his barometer reading. The difference in elevation between two monuments should be checked by the aneroid differences and the office correction. If not, distribute the excess difference as a field error, according to the per hour rate as obtained by dividing the excess difference by the time it took to go from one monument via the strips to the other monument. The 20-foot contour interval seems to give sufficient detail, and is consistent with the pacing and aneroid accuracies. An office aneroid read every hour or a barograph will detect the fluctuations in air pressure and show the particular time of day when they occurred. From this office record corrections are made on the field work, as stated above, and the contours connected between strips. When completely corrected for errors in elevation and pacing, a tracing is made. The tracing will show all details obtained in the field. From it we get blue prints, and these are our working plans for logging operations and railroad location. The routes can be sketched in roughly with lead pencil, according to the per cent. of grade. The landing locations may also be shown. On it one can point out to the manager, logging superintendent, office man, or woodsman any or all information required to carry on the operation in a businesslike manner—namely, burned or deteriorating bodies of timber which should be logged first, camp locations, water supply, railroad locations, landings, and any or all operating plans in detail. The maximum value is in the map before any loggings is begun. As the logging progresses its value depreciates in the same ratio as the number of thousand feet logged bears to the total feet in the tract.

Checking Up Results.

The accuracy of the map for railroading in particular and operation plans in general depends upon the personal equation of the mapper. The care used in pacing and reading the aneroid, the distribution of pacing and aneroid corrections, the connecting up of contours between strips and the preservation of contour detail when tracing the map off the field sheets aids wonderfully in obtaining a good map. The per cent. of permissible error varies. On maps made by the students of the University of Washington on their field trip to the Hamilton Logging Company at Hamilton, Wash., in 1913 and 1914 preliminary lines were laid out on topographic maps constructed by them, the length of line scaled, and the grade figured necessary to reach a given point. When the field location was completed and the sea level elevation taken the work checked out within five feet. This is an error of one in eight hundred. Other lines so laid out checked even better, and one checked one in five hundred. These accuracies are, indeed, phenomenal and surprising, to say the least. However, such results cannot be so easily obtained where one man makes the map and another uses it, because the latter is not aware of the degree of accuracy used by the maker of the map. For operations in large, difficult tracts of timber it certainly pays to have maps made early and accurately. The cost of the map is small indeed compared to the returns on the investment.

Keeping a Tight Rein on Forest Fires

How does the permit plan of controlling settlers' fires work in other provinces and states? This question has aroused public interest since the disastrous consequences of uncontrolled settlers' fires in Northern Ontario in July and August.

"After a careful study of the question," writes Hon. Jules Allard, Minister of Lands and Forests for Quebec, "we came to the conclusion that the most efficient means of protecting the forests from damage caused by settlers' fires, at the same time fostering the agricultural development of the province, was the permit system. This year there must have been over 2,500 permits granted. There has been no damage caused by fire for clearing purposes made in virtue of these permits."

The President of the St. Maurice Forest Protective Association of Quebec, patrolling 12,000 square miles of forested and partly settled country, states under date of August 31, 1916:—"We have been so successful under the permit system that we would under no circumstances go back to the old way of handling fires. The settlers have co-operated with us in every way and their satisfactoion is universal. So far, we have had not a single fire caused by a settler, a most unusual and satisfactory record."

The Chief Forester of the Western Forestry and Conservation Association, Portland, Ore., says:—"In our Pacific Northwestern States, the burning permit is as accepted a part of fire prevention as patrol or fire fighting. No one considers abandoning it. Last year in the State of Washington alone, nearly 13,000 burning permits were issued and under them 118,000 acres were burned over. The permit is an absolute essential of any serious attempt to reduce fire in a developing forest region."

From experience gained in British Columbia the unqualified statement is made by the government that unless brush burning is controlled by means of permits, no real fire protection is possible in a timbered country.

Advises B. C. Exporters to get Together

Mr. P. E. Stainton, representing the firm of J. C. Spedding, Auckland, New Zealand, is on a visit to Vancouver and other B. C. centres in connection with a tour which he is making around the world in the interests of his firm. In an interview at Vancouver Mr. Stainton said that B. C. would never get the lumber business of New Zealand or Australia, unless the lumber interests of the province went after it, not as individuals, but conjointly. "There is no use," he said, "in any one firm trying to get business down there off its own bat; it will not have any effect. The only thing to do to get hold of the markets is to get together and work together, and so far as I can hear that is not being done at the present time in British Columbia. What you need is more co-operation. It has been said that America is selling us their lumber at a loss. It is the greatest nonsense to suggest such a thing. Did you ever hear of an American doing that? They are making a profit and the British Columbians could do the same thing.

"To get this business what is wanted is a trade representative in centres that will be able to put the lumbermen of British Columbia in touch with the firms in Australia and New Zealand engaged in the business. I know for a fact that the Americans act on that principle and they are getting 97 per cent. of the business. Year after year British Columbia has been losing and unless you wake up you will lose the other three per cent. that you now hold, but which you will not hold very long the way things are going."

Lumber Cost Accounting

AN OUTLINE OF METHOD IN USE IN A LARGE MILL ON THE PACIFIC COAST

By William Brims, Vancouver, B. C.

In a factory where only one article is made, and that article in one quality, the figuring of manufacturing costs is a comparatively simple matter. On the other hand, in a plant that turns out several materials of different qualities, going through various processes of manufacture, the determining of the exact cost of each article in its different grades requires a considerable amount of time and labor.

The business of lumber manufacturing must be grouped with the latter class, for, while it is true that all lumber is produced from the same raw product, i.e., the log, the raw products differ in quality and value, and the manufactured article varies to a much greater degree.

Form No. 1. LOG ACCOUNT - MONTHLY REPORT

	Number of feet	Cost	Average per M
Inventory - beginning of month			
Purchased during month (add)			
Total			
Logs sold during month (deduct)			
Total "X"			
Logs sawn during month			
Inventory at end of month			

It is the allotment of the costs of manufacture to the several grades of manufactured lumber that presents the greatest difficulty in compiling a cost accounting system for a sawmill that operates its own dry-kilns and planing mill.

The writer will endeavor in this article to explain briefly a system of cost accounting similar to that adopted by Messrs. J. Hanbury & Company, Ltd., of Vancouver. Mr. J. Hanbury, president of that progressive company, readily saw, after recently completing his up-to-date plant, that it would be necessary to keep a close tab on the manufacing costs, in order to follow his policy of manufacturing lumber of the highest quality and, at the same time, meet competition in prices.

The reader will observe, in looking over the forms shown here, that to get over the difficulty of defining the actual cost of the different classes and grades of lumber the cost has been based on the total sawmill cut, as compared with the total net average selling price of all grades, and, further, that the cost of manufacture is figured on the government log scale, with no allowance made for over-run. This was done to give a conservative showing in costs and to make things appear not too rosy. There is wisdom in this method, because should the manufacturer base his costs on the sawmill tally of lumber sawn, he is likely to overlook the waste in subsequent manufacturing and to find a shortage in stock when the inventory is taken. Then, again, when the log scale is used as a basis for computation, the over-run is always in reserve to provide for any unforseen expenses.

In going over the forms shown with this article we will assume that they are to cover the first operating month of the fiscal year, and that the log and lumber inventories have been taken and valued accurately at the beginning of the year. As all operating expense is based on the log cut, we shall begin by finding the quantity and value of the logs sawn for the month.

The first thing is to take an inventory of the logs on hand at the end of the month. By using a little foresight in keeping as few as possible loose logs in the log pond at the end of the month, the inventory can be taken with little trouble, as the government scale can be used on all unbroken booms. With Form No. 1 (Log Account) we can determine the number of feet and the total and average cost of logs sawn. The number of feet of logs sawn during the month is found by deducting the number of feet in the "inventory at end of month" from the total marked "X" and, as the number of feet and cost of "logs sawn during month" added to "inventory at end of month" must equal the total "X," the average cost per thousand feet will be the same as shown for that total. The figures of the log inventory at the end of each month will, of course, be used as the inventory at the beginning of the following month. Having found the quantity and value of the logs sawn during the month, we will turn to the cost of manufacture.

Form No. 2 (Time Sheet) is a sample of the form used as a monthly time sheet for each employee, giving the distribution of his labor cost. By making a summary of all the time sheets we have a complete distribution of the total labor costs of the different departments for the month.

Form No. 3 (Power Operating) should be made up next, and the cost divided amongst the different departments. The proportions of power used by the sawmill and the planing mill can be computed by the horse power used, and the engineer should be able to determine the percentage used in supplying heat for the dry kilns.

Forms Nos. 4 to 10, inclusive, can now be made up from the distribution of labor and power and the other expense accounts as shown by the books of the company. At the foot of Form No. 4 is figured the average sawing cost per thousand feet (log scale) or, as it is shown on the form, "average cost over trimmers." This shows the actual cost of sawing the logs, exclusive of the costs of sorting, grading, and further manufacture. Forms Nos. 8 and 9 show the average "cost of handling, per M feet." These figures are based on the number of feet shipped, and are used only as a means of checking the handling expense of the output of the plant from month to month. It is evident that, to have the cost of handling figured on a true basis, the amount of lumber shipped each month must be the same as the sawmill cut.

Form No. 11 (Cost of Manufacture and Shipping is a recapitulation of the different manufacturing expenses shown on Forms Nos. 4 to 10, and gives the total average cost, per thousand feet, for manufacturing and handling.

Total

Form No. 12 (Lumber Trading Account) is the most important statement shown, for it brings the manufacturer face to face with the net result of the month's operations. It shows the net average, per thousand feet, received for the lumber sold as compared with the actual cost of manufacturing. During the years of depression that the lumbering industry has experienced it required a sawmill owner or manager of robust constitution and iron nerve to peruse this statement month after month. The item of "sale deductions," shown as being deducted from the total gross sales, is made up of advertising expense, salesmen's commissions, discounts, and exchange on drafts and cheques and other similar expenses, so the "net sales" shows only the actual amount received for the month's shipments. This form shows also a monthly inventory of the stock on hand and the total and average value of that stock. The total and average of this inventory is found by deducting the number of feet sold from the total marked "X," and as the number of feet and amount shown in "total cost of sales" and "inventory at the end of month" equal the total marked "X," the average value of these items will be the same as of that total.

Form No. 8. WHOLESALE YARD AND SHIPPING

Total
Yard Expense
Repairs to Platforms, Trucks, etc.,
Total
Lumber Shipped
Cost of Handling, per M feet

One of the greatest benefits of a cost system is to have a ready comparison, month with month, of the manufacturing cost and selling average. Form No. 1 should be kept up, showing the accumulative number of feet, costs, and averages for the year to date, so that these averages may be compared with those of the month under analysis. This will show the total quantity of logs purchased for the year to date, with the total and average costs, and the total logs sold for the year to date, and the total and average receipts, and the total logs sawn for the year to date, with the total and average costs.

Form No. 12 should be treated in a like manner. The accumulative totals on this form will give the total number of feet of lumber sold for the year to date, with the total receipts and average price obtained, the total operating expense for the year to date, and the average operating cost, the total lumber purchased for the year to date, and the average price paid, the present stock on hand and average cost, and the net profit or loss on sales for the year to date. The total for lumber sawn, log scale, for the year will be the same as the logs sawn on Form No. 1.

Form No. 10. GENERAL EXPENSE

Form No. 13. MONTHLY GENERAL SUMMARY

Average cost of logs sawn - log scale
Average cost of sawing expense
Average cost of total manufacturing expense
Average cost of lumber purchased
Total average cost of production
Total average cost of stock on hand

Wholesale average selling price
Retail average selling price
Construction average selling price
Net total average selling price
Net total average selling price for year, to date

Margin per M feet on lumber sold - profit or loss

GRADES OF LUMBER SOLD
Percentage of clears
Percentage of commons
Percentage of culls

Over-run at saw-mill over log scale

Several forms of general summary may be evolved from the information now obtained, and Form No. 13 is a simple sample of this form. It shows, in a concise manner, the average manufacturing costs as set against the average selling prices. The difference between the "net total average selling price" and the "total average cost of stock on hand" tells, under the "margin per M feet on lumber sold," the profit or loss on each thousand feet sold during the month. Where a tally of the sawmill actual cut is kept the percentage of over-run over the log scale can be shown at the foot of this summary.

When shipments are comprised of shingles and lath, as well as of lumber of all grades, a careful distribution of sales must be made to show the actual amount received at the mill for each of the articles named, and, at the same time, to show the number of feet of clear, common, and cull lumber shipped. This distribution can be made most easily from the invoices, and it should be kept up daily, so as not to entail too much work at the end of the month. It will be found necessary to keep a record of the grades of lumber sold, as the net average selling price naturally depends greatly on the quality of the products marketed. This average might mislead the manufacturer by appearing satisfactory when, in reality, the shipments for the month were of a higher grade than the stock on hand. The manufacturer has to guard against pushing the sale of his uppers and allowing the lower grades to accumulate, as when inventory time comes he is likely to have a rude awakening to the fact that a large percentage of his stock is composed of culls and other low-grade material.

Percy E. Heeney in Business for Himself

Percy E. Heeney, wholesale lumber dealer, Kitchener, Ont., who started in business for himself in March of this year, is well known to a great many lumbermen of Ontario on account of his long connection with the business in its various branches. He was born in the Gatineau district in 1882 and his father was one of the early jobbers in that country for Gilmour and Hughson, Hull, P.Q. Mr. Heeney has had experience in the shanties and sawmills for many years. In his early days he drove the Kazabazua River for several years. He has been more or less in the lumbering business since boyhood, but his first definite connection with it in a business way was with Geo. C. Goodfellow, of Montreal, in 1904. He lived in Montreal for nine years, and then moved to Berlin, Ont. For six months he travelled western Ontario and then he formed the Glengarry Lumber Ltd., of Berlin, in 1912, being vice-president and general manager of the company until March of this year, when he started in business for himself. Mr. Heeney deals principally in American hardwoods, being the sole agent for D. E. Hewitt Lumber, from Huntington, West Va. He also handles Canadian hardwoods, B. C. shingles and fir. To a great extent he confines his business to the furniture trade. Before leaving Montreal he travelled mostly in the eastern provinces, going as far as Prince Edward Island and St. Johns, Nfld. At the first of next year he will be placing a man in this territory.

Reports from Vancouver, B.C., state that all danger from forest fires during the present year is now practically over, according to advice received from district foresters. Of course, the situation will depend entirely upon weather conditions, but with normal weather the outlook is for no further fires this year.

The West Coast Lumbermen's Association, of Seattle, is distributing a "Structural Timber Handbook" on Pacific Coast woods, the idea being to supply architects and engineers with reliable information as to safe loads, strength, etc., and at the same time present a lot of interesting facts relating to the creosoting and kiln drying of lumber, the merits of wooden silos and red cedar shingles, and other data calculated to promote the use of wood in place of substitutes. The Handbook was compiled by O. P. M. Goss, consulting engineer of the Association.

Retail Costs—How Do You Figure Them?

A Practical Outline of Methods That Have Been Used With Success—Elusive Profit Chasing—How to Track It Down

The ways in which costs are checked up in connection with the retail lumber business are so numerous and various that the task of unifying them would be a big undertaking. There has already been a good deal of study of the subject, however, especially among retail associations and on the part of some of the larger, more progressive yards, and much of the spade work has been finished. Many of the elementary points of importance are covered in a summary of the problem which we were fortunate enough to come across recently, and which we reproduce for the benefit of our retail readers, both large and small. The subject of cost finding is discussed in fourteen concise paragraphs, as follows:—

1st. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of all real estate.

2nd. Charge rental on all real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or leasing it to others.

3rd. Charge, in addition to what you would pay for hired help, an amount equal to what your services would be worth to others, also treat in like manner the services of any member of your family employed in the business, but not on your regular pay-roll.

4th. Charge depreciation on all goods carried over, on which you may have to make a less price because of change in style, damage, or other cause.

5th. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.

6th. Charge the amounts donated or subscriptions paid.

7th. Charge all fixed expense, such as taxes, insurance, water, light, fuel, etc.

8th. Charge all incidental expense, such as drayage, postage, office supplies, livery, or expense of horses or wagons, telegrams, and 'phones, advertising, canvassing, etc.

9th. Charge losses of every character, including goods stolen or sent out and not charged, allowances made to customers, bad debts, etc.

10th. Charge collection expense.

11th. Charge any expense not enumerated above.

12th. When you have ascertained what the sum of all the foregoing items is, prove it by your books, and you will have your total expense for the year, then divide this figure by the total of your sales, and it will show the percent which it has cost you to do business.

13th. Take this percent and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight) and the result will show your net profit or loss on the article.

14th. Go over the selling prices of the various articles you handle and see where you stand as to profits, and then get busy in putting your selling figures on a profitable basis, and talk it over with your competitor, as well.

Cost of Doing Business—Figure it Out

An article cost $1.00 to manufacture. The expenses of selling the article are 18 per cent. For what must it sell to make a net profit of 10 per cent.?

Nine out of ten men can't solve it. Can you?

Practically every business arithmetic on the market would give $1.28, taking the first cost as the basis for estimating cost of sales and profit.

Imagine our surprise upon being informed that the result is $1.39, the author insisting that the expense of selling and the cost should be quoted on the basis of the selling price.

Many failures in business are due to the practice of basing desired profits on cost. Yet, many business men seem to have persistently refused to acknowledge that any per cent. of a smaller sum is a smaller percent of a larger sum; that if a fixed sum is a certain per-cent of a certain sum, it is a smaller percent of a larger sum, or, to put it correctly, that if 25 is 25 per cent. of 100, it is only 20 per cent. of 125, and 25 per cent. increase over cost is 20 per cent. profit on the selling price.

Applying the above example to the retail lumber business:

Stock costing $20 per M. should be sold for $28 per M.
Stock costing $30 per M. should be sold for $42 per M.
Stock costing $40 per M. should be sold for $55 per M.

Government statistics for 1914 on 250,000 corporations throughout the United States give the following information:

10,000 made more than $5,000 profit for the year.
190,000 made less than $5,000 profit for the year.
50,000 showed a loss.

Statement of the Retail Lumber Company

Inventory, on hand January 1st, 1915	$25,000	
Stock purchased during 1915	88,000	
	$113,000	
Inventory, on hand January 1st, 1916	30,000	
Mdse cost for 1915	$83,000	
Sales		$125,000
Mdse. cost	$83,000	
Carpenter wages	5,400	
Power in mill	300	
Depreciation in machines	300	
Other mill expense	1,000	90,000
Gross profit		$35,000
Expenses		
Yard wages	$5,000	
Rent	2,500	
Insurance	400	
Office salaries	6,000	
Hauling expense	5,700	
Drivers, feed, harness repair, wagon repair, shoeing, depreciation).		
Advertising	600	
Bad accounts	1,000	
Office supplies (light, heat, telephone service)	600	
Interest and discount	700	22,500
Net profit		$12,500
Cost to do business	18 per cent. on sales	
Net profit	10 per cent. on sales	
Gross profit	28 per cent. on sales	

In order to obtain above profit you must add forty per cent. to cost of material, as follows:

Lumber costing $20 per M. should be sold at $28 per M. ft.
Lumber costing $50 per M. should be sold at $70 per M. ft.

If lumber must be surfaced or work in mill this additional expense should be added to cost before adding forty per cent for selling price.

The following sample statement of a retail lumber company shows in concrete form the way in which this end of the business is handled by a successful firm:

An illustration of the relation existing between profit, overhead expense, selling price and the volume of business is shown in the following table, from which it will be seen that it is far more important to get a price that includes a real profit, than it is to turn over a large quantity of stock.

Large sales and small profits, or smaller sales and larger profits (All based on same priced lumber and 20 per cent expense of doing business).

Ft. Handled.	Cost per M.	Percent Added.	Selling Price.	20 Percent Overhead.	Profit per M.	Total Profit.
4,000,000	$23.00	25%	$28.75	$5.75	$0.00	$0000
3,000,000	23.00	30%	29.90	5.98	.92	2760
1,500,000	23.00	35%	31.05	6.21	1.84	2760
1,000,000	23.00	40%	32.20	6.44	2.76	2760

An analysis of the average expense of a retail yard doing business in a small town, as worked out from a large number of reports received shows the following results:—

	Per M. ft.
Unloading	$ .50
Loading on wagons	.50
Hauling and delivery	1.00
Depreciation of equipment and sundry expense	.75
Rent	.25
Insurance	.10
Interest on borrowed money	.25
Interest on capital invested	.50
Office expense, light, heat, telephone, office supplies, etc.	.50
Management expense	.50
Bad accounts	.25
Advertising	.25
	$5.35

The figures and ideas given above, while the result of actual experience covering many years' business, are not given as hard and fast rules by which to regulate the affairs of any yard. Local conditions will always have to be considered, which will affect results. We would appreciate an opportunity of expanding upon these ideas by publishing the conclusions reached by retail readers in their own business. Let us have your opinions and experience to hand on to others.

Timber Trade of the Fiji Islands

A Comparatively Small Market, But One of Exceptional Interest to B. C. Shippers

The Fiji Islands afford a timber market depending exclusively, even in normal times, upon sailing vessels for transport. The market, therefore, possesses for the owners of sailing vessels now building on the Canadian Pacific coast an interest disproportionate to its size, says H. R. MacMillan, in a special report to the Department of Trade and Commerce, published in the Weekly Bulletin.

The total importations of timber into the Fiji Islands during the year 1914 are given in the following tabular statement:

Commodity.	Quantity, Feet, B.M.	Value.
Fruit case shooks	4,730,623	£10,598
Rough lumber	3,750,360	27,145
Dressed lumber	2,261,443	12,938
Sash and doors	.....	1,385
Total	10,742,425	£52,066

The islands produce no quantity of timber suitable either for general building purposes or for shooks for the important fruit exports.

Douglas fir is the universal building material. There being no sawmills, all timber is imported in the sizes in which it is to be used. The trade of the islands is in the hands of two importing companies, who carry stocks at the principal ports—Levuka and Suva. Sailing vessels only are suitable for the trade. Vessels carrying 600,000 to 1,200,000 feet are preferred.

The long use of Douglas fir under tropical conditions in the Fiji Islands affords a valuable illustration of the suitability of the timber for service in the tropics. Buildings built thirty years ago with Douglas fir flooring, studding, and siding are still standing sonud in Suva.

White ants are present everywhere, though not so voracious as in parts of India, Africa, and Australia. Douglas fir is regarded in Suva as ant resistant. Where New Zealand kauri and Douglas fir were placed side by side as studding several years ago the kauri has been eaten out by white ants and the Douglas fir remains sound.

The only railways existing in the islands are those operated by the sugar companies, some of which reach a length of sixty miles. Up to the present the sleepers have been of Australian ironbark. The high price and growing scarcity of this timber renders possible competition by creosoted Douglas fir in times of normal freight rates. This question should be taken up by Canadian exporters of creosoted fir sleepers.

Canada stands first in the list of countries supplying Fiji with timber. The position is due not so much to the exportation of lumber as to the facilities which the Canadian and Australian Royal Mail Line have afforded for capturing the fruit-case market.

The prospects are good for increasing the proportion of Canadian exports. The exports from the United States to Fiji consist wholly of Douglas fir. The existence of Canadian-owned sailing vessels will enable lumber manufacturers to quote competitive c.i.f. prices and secure a large share of the trade.

The most important section of the timber trade in Fiji is the supplying of fruit cases. No woods suitable for fruit cases have been exploited on the islands. The Australian woods are unsuitable. The Canadian woods have established over the New Zealand shooks a superiority in price, delivery, and sustained quality. So long as it is possible to make regular monthly deliveries by the Canadian-Australian line or periodic deliveries by schooner sailings with lumber cargoes Canadian exporters will command this increasing trade.

The chief opportunity for Canada in rough lumber lies in the fact that the United States exports are now twice the volume of the Canadian. Canadian lumber is preferred to the United States lumber, but up to the present there has been only one Canadian exporting firm quoting competitive c.i.f. prices with which Fiji importers have been able to form permanent connections. As soon as another Canadian firm takes up the trade persistently Canadian exports will increase. The name of an important importer desirous of forming Canadian connections may be secured from the Commercial Intelligence Branch of the Department of Trade and Commerce, Ottawa.

The rough lumber imported into Fiji is nearly all in one and two-inch thicknesses, widths up to twelve inches, about half merchantable and half select.

About half the Douglas fir imported to Fiji is dressed, the lines being flooring, drop siding, ceiling, and partition stock. The interior finish used is wholly Douglas fir, chiefly in Pacific Coast standard sizes of beaded and V-jointed ceiling and partition stock. Practically no panelling is used. The market for wide panelling or three-ply for interior trim is capable of only very slight development. Douglas fir shelving is used to a limited extent for shelving in competition with New Zealand kauri. For this purpose wide clears are imported.

In a trip extending through several European countries, Africa, India, and Australia, the Fiji Islands were the only point visited where Douglas fir flooring was in use as a staple article. That Douglas fir flooring should be in almost as universal use in tropical Fiji as in British Columbia is an indication that an active policy of market development would greatly extend its use in other southern and eastern countries in competition with the Scandinavian flooring now used or the tropical hardwoods likely to be developed in the next decade or two.

The specifications for Fiji cargoes usually provide that each shipment is approximately half rough and half dressed lumber.

Canada at present supplies less than one-quarter of Fiji's imports of dressed lumber and only one-third of Fiji's imports of dressed Douglas fir.

Fiji is dependent entirely on outside sources for doors and sash. New Zealand and Australia have up to the present done the whole of the trade.

The manufacture of doors is at least three times as costly both in New Zealand and Australia as it is in Canada. Australia, in particular, is dependent upon imported timber for doors and sash. This is to an important degree true also of New Zealand. The fact that Canadian manufacturers have been able to build up an important market in New Zealand itself and that where quality is considered, as well as price, Canadian doors can be sold in Australia, makes it certain that Canadian door exporters may, if they desire, secure the whole of the Fiji trade. The regular sailings of the mail line from British Columbia ports to Suva afford Canadians an opportunity for dominating the door trade as they already have the shook trade.

The names of the chief importers of doors may be obtained from the Department of Trade and Commerce.

The use of fir doors may be expected to develop a small demand for fir, three-ply, for interior finish.

In all foreign markets visited the use of fir doors has been the chief agent in introducing a further use of fir in panels or three-ply wainscotting and accompanying interior finish.

Canadian exporters may secure the whole of the Fiji trade if they desire it at the governing prices. The names of importers desirous of receiving Canadian quotations when they are next in the market may be secured from the Commercial Intelligence Branch of the Department of Trade and Commerce, Ottawa.

The Fiji trade is important to British Columbia shipping interests in that it is entirely dependent, even in normal times, upon sailing vessel shipments. The size of the market and the limited discharging facilities render impossible the acceptance of steamer cargoes. Conditions in Fiji may further be taken as indicative of the remainder of the South Sea Island trade, amounting normally to 10,000,000 feet annually. This trade has in the past gone almost wholly to United States ports, and has furnished eight to ten sailings yearly for American schooners, most of which receive return cargoes.

The South Sea Islands may not be regarded at the present time as a market worthy the attention of Canadian exports. They constitute, however, over 10 per cent. of the market open to lumber-carrying schooners during periods of normal freight rates. Connections formed in these islands now, by the managing agents of the schooners building in Canadian ports, will prove valuable when the tramp steamer again enters the Australian timber carrying trade.

There is no preferential tariff in Fiji for British products. The general tariff on timber products is as follows:

Class of timber.	Customs tariff, per cent. ad valorem.
Timber cut for cases, not exceeding 3 feet in length	12½
Doors and sash	12½
Timber, dressed or undressed, not over two inches wide	12½

	Per hundred feet. s.	d.
Undressed timber, over two inches wide	1	6
Dressed timber, over two inches wide	2	0

Representatives of American lumber interests, aided by the United States Government, laid plans, at a conference at Chicago recently, for sending expert business promoters to Europe to obtain a share of the business of reconstruction after the war. The conference was called by Dr. E. E. Pratt, chief of the Bureau of Foreign and Domestic Commerce. Agents for the lumbermen will leave for Europe, probably in November, accompanied by Government experts, to study trade conditions.

Early Days Among Loggers

Reminiscences of a Pioneer Recalling Stirring Events of Three Score Years

Life along the St. John River during my early boyhood was full of activity; and in the forest or on the farm every moment of the day, from dawn until twilight, was given up to labor. The period was one of abounding prosperity. The demand for timber from abroad, especially for masts and spars, was apparently unlimited and as the forests were cleared away the fertile soil, especially in the intervals, yielded rich harvests. These opportunities were the goal for an unending stream of immigrants principally from Ireland and Scotland.

The St. John River, the broad thoroughfare to the sea, was a constantly shifting panorama of the industries which prevailed along its banks, from the wilderness above to the city at its mouth where the tide rolls in with resistless energy from the Bay of Fundy. At Hartland and Spring Hill I saw, as a child, the products of the forest go by in an endless stream of rafts, the towboats laden with supplies for the farms, the canoes of the Indians and white men, the pirogues of the Acadians carrying to market the woolen garments made from their own flocks of sheep, and maple sugar obtained in the woods. Even at night it was not still. Through the darkness flared the flambeaux of the fishermen, the lure of the salmon of which its waters yielded rich harvest.

The lands bordering upon the river from the mouth to Grand Falls, over which I have seen huge logs plunge like ships in a torrent, were considered from the point of view of the time a well settled area. Villages and small settlements were numerous and at intervals between them were small water-mills, taverns and stores at which the farmers obtained their supplies. In addition to the common occupations, farming and lumbering, vessel-building had become a well established industry. It was carried on at Hartland, Squire Nevers' place and at Taylor town and Sheffield—the one above, the other below, Maugerville. It is recorded that Benedict Arnold, who took refuge in the province and lived for a time at St. John, came into possession by not altogether honorable means of the Lord Sheffield, the first ship built on the river. As far back as 1800, sixty-seven ships were launched on the St. John; and at one time during that period two hundred square rigged vessels lay in St. John harbor awaiting cargoes.

For those who were old enough life meant, at this time, little more than hard work. My father gave his attention to the farm during the summer time. In the winter and spring he was away in the woods, lumbering or logging. This routine was followed by most of the men on the upper St. John; and not a few of them, when the long day was over, came home to thresh grain and attend to the needs of their live stock.

The Maine Boundary Dispute

The most important historical event of which I have a clear recollection was the controversy in 1839 over the boundary between Maine and New Brunswick, sometimes called the Aroostook War. In the diminishing perspective of three-quarters of a century this incident appears to have been of little consequence, but in the environment in which I lived it loomed large in its proportions and to the people of the province it was a matter of grave portent.

The region involved in the controversy was that in which my father lumbered and was generally known as Madawaska, the territory originally occupied by the Acadians when they were transferred from their earlier settlements along the St. John.

Under the shadow of war in 1839 lumbering operations in Aroostook County and along the upper St. John generally ceased. On March 1st eight hundred fusiliers arrived in St. John from Cork and five hundred British regulars were sent to Madawaska. The farmers and lumbermen of the vicinity under British jurisdiction were pressed into service to haul soldiers to Quebec where the garrison was being strengthened; and on both sides of the boundary the militia was held in readiness for war, trains of sleighs laden with soldiers and munitions stretching along the roads through the forests.

Fortunately, the war over the boundary was averted largely through the efforts of Sir John Harvey, Governor of New Brunswick, and General Winfield Scott.

At this time the dominating industry along the St. John River which overshadowed every other activity was lumbering. It was to the forests that the province owed in greatest measure its prosperity and its rapid development. From the very outset of its history they attracted the attention of explorers. French and English navigators skirting the shores of the St. John River observed that the trees were of a size far greater than those yielded by the forests of the old world, and because of their straight trunks and great height were incomparable for masts and spars. Nowhere else, it was thought, could such timber be obtained, and the constantly increasing size of sailing vessels demanded loftier masts for their equipment.

When the English dominion was extended into Canada, after the battle of Quebec, the English Government itself adopted a plan prohibiting the cutting of pine trees within three miles of the shores of the St. John River. Later surveyors of the Crown were sent into the woods to select trees suitable for masts, which they marked with broad arrows. Afterward this plan was abandoned and a law was passed allowing a bounty for trees beyond a certain size. This, I believe, is still in effect, although it is no longer observed.

Commencement of the Mast Industry

Immediately after the Revolution, when the supply from the colonies was cut off, the British Government entered into contracts with New Brunswick lumbermen to provide masts for the Royal Navy, and two or three firms took up the work. The arrival of the first cargo at Halifax on the way to England in a navy transport was considered of such importance that it was announced to the British Secretary of State by the Lieutenant-Governor.

The rivalry to obtain suitable trees was keen among these early operators. The importance which the industry assumed may be gathered from the Francklin, Hazen and White correspondence, according to which success was measured in terms of the number and size of logs obtained. "I take this opportunity," Peabody, one of the agents wrote to his firm in 1782, "of acquainting you that I have the offer of about twenty sticks from Samuel Nevers and Mr. Tapley. The sticks is well sized, one mast of 30 inches and one 23 inch Card, and others of lower sizes. I finished hauling masts at Roosegwanis last Thursday. Got out 37 sticks without any misfortune, and tomorrow morning shall move our teams to Glazier's, where I expect to get out 40 or 45 sticks.

The greater proportion of merchantable timber at this time was ton timber or hewn timber, although some lumber was sawed in the small water-mills along the river and at St. John. A ton or load was twelve inches square and forty feet long. Sometimes as much as eight or ten tons were obtained from a single pine tree and timber from twenty to thirty inches square was exceedingly valuable. In this form it was transported, in ships built especially for that purpose, to England, Ireland and Scotland, where it was in great demand, and whip-sawed by hand.

Saw the Forests Melt Away

To digress for a moment; I doubt whether anyone has a keener realization than I of the extent to which the timber resources of the United States are being exhausted. When I was a boy the thousands of rafts floated down the St. John River gave evidence of the wealth of the forests that were falling before the axe of the colonist and the lumberman. Later, when I went to Maine with my father, the upper reaches of the Penobscot poured a constant stream of logs down to the busy mills between Oldtown and Bangor. What the great stretch of continent to the westward was to yield in the way of timber was as yet a closed book, some of the pages of which I myself turned from day to day in the way of work and experience. It fell to my lot in some measure to blaze a way through some of the most extensive forests that have added millions to the wealth of the country and contributed more than can be easily estimated to its upbuilding.

Within the limits of a single lifetime, a rather long lifetime, perhaps, what once seemed to be illimitable stretches of virgin forest in New Brunswick, in Maine, in Wisconsin and Michigan, have melted away before the westward tide of settlement. The scarcity of timber that seemed so remote then is now ominiously close. I have seen the pine forests of Wisconsin and Michigan, untracked by white men, disappear, the hard woods going and the developed farms spreading over what was not many years ago the heart of the wilderness.

East of the Rocky Mountains timber has been cut so rapidly that there is now a scarcity of raw material for lumber, ties, pulpwood, and other products. The question of reforestation is upon us. Devastated areas must be replanted and the resources that still remain to us husbanded. This, of course, will be a slow process. From now until our efforts have yielded fruit we must look to Canada, where there is an immense wilderness of forest north of Lake Superior and west of Hudson Bay, for lumber, pulp and pulpwood. From this region the eastern portion of the United States can be supplied, and for this reason I believe there should be no tariff on lumber or any raw material coming from Canada. As a matter of fact, I am in favor of the free admission of all raw material.

Twenty-five years ago the Menominee River region was producing more logs than any other place in the world, between seven and eight hundred million feet a year, and many of the more experienced lumbermen were reaping the harvest that had been awaiting the axe from immemorial time. If the prediction had been made then that the pine timber would have been exhausted in a quarter of a century,

* From "Recollections of a Long Life, 1829-1915," by Isaac Stephenson.

it would have been received with derision. Yet this has come to pass.

There are still great forests in California, Oregon, and Washington, but I now venture to make the prohpecy that in another twenty-five years this supply will be practically exhausted if restrictive measures are not imposed upon the activities of the lumbermen. What with the cutting and the waste, the devastating forest fires, and the perisistent extension of the cultivated land area, timber will be scarce and we shall be obliged to look to the British possessions for our supply.

The Use of Wire Rope

Wire ropes are in such general use among the sawmills for logging and log handling that some technical knowledge in the selection and care of ropes should be of interest and advantage, so there are offered here some features pertaining to rope handling, that were developed recently at a mining institute under the subject of the care of wire rope.

The first essential seems to be that of selecting a rope of the right size and lay for the work in hand. If a rope is too large it is not only burdensome to handle but the bending strain is increased, and in the end the user pays more for rope than if he had bought smaller rope. The right idea is to secure rope of just the size needed for the work to be done, making the proper allowance for safety.

Unusually in wire rope calculations the allowance for safety is a factor of 5 to 7. This means that the breaking strain of a rope of a given size should be divided by the factor of 5 or 7 and the answer will be the largest load it should handle. Or, taking it another way, know the largest load that should be handled, multiply this by the factor of 5 or 7 and you have the tensile strength necessary in your rope; and this, in turn, will furnish a gauge to the size of rope that should be used.

The tensile strength of wire ropes range from a minimum of 60,000 pounds per square inch of cross section for iron to approximately 280,000 pounds per inch for the better quality of steel ropes.

This means that with an iron rope of one-inch cross section the largest load handled should not exceed 12,000 pounds, using the factor of 5, whereas if it were a good steel rope one inch of cross section, using the factor of 5, would be good for handling a load of 56,000 pounds.

When one buys a size or a grade of rope that will not insure a proper factor of safety, the result is a continual over-straining of the rope, and eventually it will give way under some sudden load, and, if it does no other damage, it will mean providing a new rope in so much shorter time that it would have been better to have provided the right kind of a rope in the beginning, either one of larger size or of a higher quality of material, so as to insure the proper factor of safety. Besides that, there is the element of danger attached to breaking ropes.

The majority of wire ropes are made with a fibrous centre usually termed hemp, though a number of different fibrous materials are used by the various manufacturers. There are some cases where ropes are subject to heat and soft iron centres are substitutes for the hemp and, on some occasions, steel centres are used. The general run of rope, however, for outside operations are with hemp centres, around which are wound the lays of the rope. What is means by the lay of the rope is the distance in length for each complete revolution or twist of a strand. The usual length of a lay is seven times the diameter of the rope, which in the case of a rope one inch in diameter would be 7 inches, from the exact top centre of one twist to the next. To vary this, to shorten the length of the lay adds flexibility to the rope, while to lengthen the lay increases the stiffness of the rope. In other words, a rope with comparatively short twists in it is more flexible than one of longer twists.

It is pointed out that the three desirable factors in a wire rope are strength, toughness, and flexibility. There must be strength enough to sustain the load with a reasonable factor of safety, which is given as from 5 to 7, it must have enough flexibility to minimize the bending stress, and finally the wires must be of such a size as to withstand a reasonable reduction in size through abrasion, and they must be tough to resist the tendency to crystallization and become brittle from bending and from rapid operations. Sometimes it is found that no one factor here can be increased materially without detracting from the other. For example, to get toughness and freedom from crystallization often calls for softer metal, which, in turn, will wear quicker from abrasion. So a sort of happy medium must be arrived at from a consideration of the service to be given, and the needs to secure long life and safety in a rope for this service. For example, a rope that is subject to unusual abrasive wear may well be made a little harder, and some sacrifice must be made of the toughening qualities to get resistance to abrasion. All these things, however, must be handled thoughtfully and by men who understand thoroughly what they are doing.

While the use of rope too small is bad practice and dangerous practice, one should not, for this reason, go to the other extreme and use rope too large, because a rope too large is stiffer, using up unnecessary power in bending, and it is heavy to handle. The right idea is to get specific data on the tensile strength of the rope to be used. Then taken into consideration the largest load likely to be handled and the average load handled regularly, and from this figure out the exact size that will give the required factor of safety.

In using rope one should guard against what is termed over-winding on the drum. To wind one layer of rope over another on a drum increases the wear on the rope, especially if it is allowed to wind and overwind unevenly. Also it is likely to jam and mesh, and, wherever practical, one should avoid overwinding. Also the guiding sheive should be set far enough from the drum that there may not be short angles. This makes the load easier and saves bending strain.

Proper lubrication is another item of importance. This is important not only in determining, or rather regulating, the wear of the rope, but in protecting it from what might be termed interior decay. A wire rope must be lubricated for this purpose, because, in winding around the drum and running over sheives, the rope bends and the strands and wires move on each other, and they must be kept lubricated to prevent excessive wear. Also lubrication serves to prevent corrosion.

Generally when wire ropes are made they are thoroughly lubricated through and through, and it is important for the user of the rope to keep up the good work by supplying lubrication from time to time as it is needed.

The question of the best lubricant for a rope is the subject of just as much discussion as the best lubricant for machinery bearings. There are many different ideas and opinions, but when they are all summed up, what they amount to is that a lubricant should have friction-reducing qualities and staying qualities—that is, it should have the quality of adhering to the metal and staying on the job. About the best way to determine the right lubricant to use here is the same as in the case of machinery. Try a few of those offered, study the claims made for them, and watch the results. In time you will not only come to understand fairly well what lubricant to use, but also how often and in what manner to apply it.

Careful attention to lubrication will do much to lengthen the life of a wire rope and to insure good, satisfactory service from it.

The 25th annual meeting of the Concatenated Order of Hoo-Hoo will be held in Memphis, Tenn., on September 9th to 12th at the Hotel Chisca.

A Pacific Coast Lumber Company's Y. M. C. A. Car

The dedication of a car for the Industrial branch of the Y.M.C.A., to be used both for the mill town and the logging camps of a Pacific Coast lumber company took place recently. The car is constructed upon a set of standard trucks and is 60 feet in length and 14 feet wide, giving ample facilities for general games and lounge room, reading and writing room, also office and bedroom for the local secretary. The plan herewith shown gives a clear idea of the furnishing and equipment. The car is equipped with air brakes and is admirably constructed for the purpose. It is proposed to keep the car at both the mill town and the camps for a period of two weeks each. Should the innovation prove a success, a permanent Y.M.C.A. may be built at the mill town, and the car utilized entirely by the logging camps.

The Y. M. C. A. work in logging camps is divided into three main units; physical, educational and moral. The physical work embraces boxing and punching the bag, fencing, contests of all kinds, log rolling, games, etc. The educational work embraces general educational talks, literature, magazines and a circulating library. The moral and religious work consists of personal influences of the secretary on the men and the holding of religious meetings every Sunday night. Memiorial services are held in case of death occurring in a camp.

These industrial branches are possible under the following conditions. The employer agrees to build the car and pay the salary of the secretary on one hand, and the employees agree to raise the money to furnish and equip the interior and its maintenance.

Membership costs $1 for three months, or $3 per annum, holders of membership cards being entitled to privileges in any Y. M. C. A. building in any part of the world.

Bad Accounts a Drag Upon Business

A Rational Plan for Extending Credit Based on Co-operation Among Dealers the Only Feasible Protection Against Loss

By G. W. Bulmer

Credits and terms of sale seem to me to be two of the big problems the retail lumberman has to solve. The weak spot in the operation of the average retail lumber business is found in the way we promiscuously extend credit to Tom, Dick, and Harry without definitely knowing whether they are really safe gentlemen to extend this credit to. And we send wagon after wagon load of what we believe to be the finest lumber that ever happened, and which cost lots of real money, to Tom, Dick, and Harry, their uncles and their aunts, their sisters and brothers, without saying a word about when, how, or where it is to be paid for.

I'll bet a dollar to a doughnut there is hardly a retail lumberman that has not noticed with horror that the accounts decorating his ledger on August 1 amount to more in dollars and cents than his total sales from inventory since the first of the year. That's pretty nearly a fact, is it not? We will all hurry home to get our share of the fine business that's coming up, but will find that we haven't as much time to devote to it as we would like to have because we must get out and hustle for our share of the crop money before it is all gone. And, even after hustling like candidates for office from September to February, and smoking out everything that looked like a loose dollar, we find that 40 per cent. of our previous year's sales are still on the books, and we figure we have fought a good fight, but have been whipped to a frazzle once more. So, in admiration, we take off our hats to the butcher, the baker, and the candlestick maker because they had been wise enough to find out if good old Uncle Tom had the wherewithal to pay—and, if he hadn't, promptly told him that there'd be nothing doing in the way of credit unless he put up security. So the country clerk was as busy as a nailer recording securities in favor of those wise guys, and the lumberman had the pleasure of watching them carry off not only the cream, but the smear case as well, and the lumberman humbly sneaked off with the whey.

Now, gentlemen, I'm not going to take up your time talking about how much this grey-whiskered, bald-headed custom in the lumber business costs us, but, believe me, the accounts we wipe off the slate, the cost of collection, the legal fuss, the tieing up of capital that we need so badly in our business, the weeping and wailing and gnashing of teeth, the stenographers we employ, the stamps and stationery we waste, the salaries of collectors and special help, the oceans of gasoline we burn in our little old cars amount to a pretty penny at the end of the year, and gather unto their vampire bosoms a chunk of the gross profits of our business that would prove astounding.

Here's another way it works out: A business that nets you $1,500 at the end of the year returns 15 per cent. net on an investment of $10,000, which on analysis, shows that $6,000 is in stock and plant and $4,000 in accounts. So you smile a smile like a slice out of a watermelon and next year you get $1,500 out of that same little old business again. But behold! when you figure up your profit on your investment you find that you have only made 8 per cent. out of the same business, and the whole thing comes out in the wash when you find that whereas you still have $6,000 in plant and stock, your outstanding accounts have jumped up to $12,000 on a total investment of $18,000. Your smile fades away into a scowl when you realize that your business is no longer a profitable one, and you wonder if you're not getting old, and consider selling the darned old business, lock, stock, and barrel, and putting your money out at 8 per cent. on gilt-edged security. And I'll bet you'd do it mighty quick, too, if it wasn't for the fact that half of your operating capital was borrowed. But that's another story, too, if you tumble to the fact that your borrowed capital costs you 9 per cent., and the best you were able to make it earn was 8 per cent., or a net loss of 1 per cent. in the shuffle.

I want to say this—and I want to say it as loudly as I can—and I believe every man here will chime in "Ab-so-lute-ly!" when I say that it's time the retail lumber dealers adopted, first, some kind of a system for the intelligent extension of credits, and, second, certain definite terms upon which our merchandise shall be sold, and sold on those terms only.

Credit Rating Reports Formulated.

A year ago our company formulated what we call a credit rating report. One side of this report blank bears the form of a very complete property statement; the other side is a blank form, wherein the name and address of the person reported upon is inserted, as well as general information bearing upon his credit standing. Below is a blank space, on one side of which are listed all instruments and judgments recorded against him, and on the other side are listed all releases. This information is secured from bulletins published by the abstractors in business at the various county seats, and the service costs $15 a year in advance or $24 a year on time. Even the abstractor, you see, knows the value of cash on the counter.

We don't wait for trouble to happen, but as soon as a new man comes into a community we put his name down on one of these reports, as well as the information we can get, and then watch the bulletins. He may be doing business with the lumber company down the street, and we don't know much about him except in a general way; but when finally he comes in to buy a granary bill on credit and we turn to our book for a look and find his homestead mortgaged for $1,200, including an interest mortgage for $120 and a chattel mortgage on everything he has under the sun, including his two old nags, Tom and Jerry, hitched to the wagon with which he hopes to haul out our lumber, we can turn him down without batting an eye. We don't even go to the trouble of having him sign the property statement unless we're curious to know if Ananias is really a back number when it comes to fancy fabrication. Our general report tells the story, and we rarely use the property statement anyway except when we're in doubt.

A year ago we were struck with the brilliant idea that we'd establish definite terms of sale and stick to them. All bills were to be figured in our "Estimate Book." If the estimate was sold and cash paid on the nail, our proposition was to allow 5 per cent. discount from our retail price. If the customer bought on credit we proposed that he immediately sign a note, rate of interest 10 per cent.—no interest to be charged for the first sixty days if paid when due. We figured to file a lien or demand other security for all notes where there was the least doubt about the customer's ability to pay. Do you think we could put it over? Not on your life. If we had adhered to our policy the tumble weeds would now be growing a mighty forest in the alleys of the lumber yards. So, instead of putting into effect a plan that we felt sure would minimize our troubles, we went back to the old way of getting the purchaser to sign a contract properly, setting forth the terms of sale and taking notes for credit sales where we could get away with it—and instead of having what we hoped to have to-day—90 per cent. of our accounts in the form of notes all bearing interest—we have a scant 50 per cent., and no hope for the future.

Your book accounts are smashing, telling blows on the solar plexus of your business. How long will the business stand it? Your customers are complaining, too, of high prices, yet your profit is only a very common, every-day profit, indeed. The burden of accounts your business is carrying is almost entirely responsible for this condition.

One man or one firm cannot remedy the situation—cannot establish definite terms of sale—but if the lumber dealers of a district would put in effect some rational plan for extending credit I feel that it would be a huge success. As I see it, it is a cinch that something of this kind must be done, because if you continue to load down your business with the handicap of the careless, inefficient methods of yesterday and enter in the race with the keener competition of to-day, something is going to happen, sure's you're born.

Let us figure out some system for the intelligent distribution of credits. Allow the cash customer the discount he's entitled to; get a note from the customer at the time of sale, with proper security where necessary; then let us put the plan into permanent and absolute effect, and I'll promise you that you'll grow fatter and sleep easier in the days to come and you'll find fewer grey hairs in your head and more profits in the bank when you size up your business at the end of the year.

Death of J. O. Smith

Many readers of the Canada Lumberman will regret to learn of the recent death of Mr. J. O. Smith, superintendent of the mills of the Spanish River Lumber Company, Limited, at Aird Island and Cutler, Ont. In our issue of September 1st we reported that Mr. Smith was on sick leave and that his many friends were hoping he would soon be back at work. Unfortunately these good wishes were of no avail. Mr. Smith passed away at Detroit, Mich., on August 30th. The mills of the Spanish River Lumber Company, Limited, at Aird Island and Cutler had always been under the superintendence of Mr. J. O. Smith, who came from Bay City, Mich. He was a gentleman of extremely genial disposition, hail fellow, well met, wherever he happened to be, and he will be greatly missed, both by the company and by the large number of lumbermen throughout Ontario to whom he was personally known.

A Unique Logging Railroad Bridge

By Samuel A. Stamm*

Hamilton Creek Logging Company, Hamilton, Wash., is constructing the Lyman Pass R. R. This road will have no adverse grade and a maximum of 3.75 per cent. grade in favor of the load. In crossing Red Cabin creek a gap 132 feet deep by 600 feet in length was encountered. In spanning this a unique bridging structure was evolved.

The bridge is of the single storey bent type; 132 feet in height from the water level to the top of the rail, and 600 feet long. The construction material consisted of fir poles in various lengths, from 70 to 130 feet with 14 inch tops, which were brought in from the camps. The mud sills varying from 30 to 70 feet were obtained on the ground. The caps 16 in. x 16 in. x 16 ft. long and 3 in. x 12 in. bracing material were mill sawed timber. The stringers, hewn with a 16 inch face and 16 inch depth by 42 feet long were imported from the camp.

The mode of construction and the details thereof are worthy of mention and will be outlined in the order in which they were encountered in constructing the bridge. The mud sills are spaced 20 feet centre to centre. The notches for the plumb and batter posts are 24 inches wide and cut to the same level; the ones for the plumb post being spaced 4 feet 8 inches centre to centre, those for the batter posts are spaced as figured on the basis of 2 feet centre to centre from the plumb to the batter post on top and a 2-inch per foot batter. The heel daps were cut on a line at right angles to the centre line of the bridge, thus aiding the framing and squaring of the bents. Twenty-one bents were framed, squared and braced on the ground. The poles were carried out to the proper bent on the sky line by one donkey and hauled side wise to place by another donkey; the butt of the post being placed in the heel dap, the tops spaced 4 feet 8 inches centre to centre of the plumb posts and 2 feet centre to centre from the plumb post to the batter post; the cap was then made fast to each post with a ¾ in. x 26 in. drift bolt. The top of this skeleton bent was shifted so that the centre of the cap coincided with the centre line of the bridge; thus squaring it on the ground, where it was braced on one side, thereby insuring a uniform turning of the posts on their respective heels while they were being raised. Also that they would stand square and firm after being raised. Those bents farthest from the donkey were put together, squared and framed first; each succeeding one was laid, tier on tier, on the previous one. The bracing material for the other side of each bent was sorted, as per following list, and placed off to one side of the mud sill of the bent on which it was to be used. Longitudinal bracing poles were also distributed along so as to do away with hauling after starting to raise the bents.

* Logging Engineer, Tacoma, Wash.

Logging Railroad Bridge Across 600 ft. Gap, 132 ft. Deep

The first eight bents were put together in the air, each post being cut to length and placed in a semi-vertical position, i.e., the butt in the notch on the mud sill and the top leaning against a false cap swung from the cap of the last bent constructed. The proper spacing of the posts being observed the cap was made fast and the offside bracing put on. The bent was then tilted forward to its final vertical position, made fast by two planks on top, afterward braced on the other side and made fast to the bents previously erected with 5-inch top hemlock poles 45 feet long. After the eight bents were raised in this manner, a loading donkey on a 54-foot sled was hauled out onto the structure so that the front end of the sled overhung the last bent about 15 feet. Its sole office there being to haul bracing material up to the workmen as it was required to be put on the bents.

The remaining twenty-one bents were raised by the donkey on the bank with the assistance of a block and one-half purchase, in the vertical to the sky line. This, however, proved to be a hinderance in view of the fact that it brought the bent up by jerks and put a heavy bight in the sky line which threw an excessive strain into the top of the bent with a tendency toward breaking the top off. This was all overcome by using a double block purchase in the horizontal, i.e., two single blocks with crotch lines on the bent, a tail hold to a stump on the bank and a block lying on top of the cap of the last bent raised, which block was anchored by a 1⅜ inch cable to the donkey on the bank. This method brought the bent up very steadily so that there was no danger of jarring the posts off of their respective footings. The haulback was used to snub the bent from going beyond the vertical. After testing the bent for plumb it was made fast with two planks on top, then the sway and longitudinal was placed. The bent having been completed the donkey on the bridge was moved ahead to go through the same process as before.

Having raised and braced all bents thoroughly, the stringers were hauled out on the bridge and spotted in place. The ends having been trimmed off and the joints broken on alternate bents, they were drift bolted to the caps. Bridge ties 6 in. x 8 in., 12 feet long, surfaced two sides were spaced 18 inches centre to centre.

The consensus of opinion now is that the building of the bridge could have been facilitated by raising the individual poles on their proper footings, permitting the tops to lean back against a false cap swung from the last bent raised as in the case of the first eight bents, then measure the proper lengths of the poles; nail on a marking board and cut off the four poles to this board thereby acquiring a snug fit for the cap.

Newspapers recently received from Christiania, Norway, contain reports of the preparation of plans for establishing a large paper mill in Brazil, to be financed by Norwegian interests. The Oversea Company and the Young Company, of Christiania, are taking the lead in the formation of the new concern, with a minimum capital of 1,250,000 kroner. They will erect a mill at Pernambuco. Shares in the company will be valued at 1,000 kroner each. The output will be one-half kraft paper and one-half manilla paper.

The 238th Forestry Battalion, which has been raised by Lieut.-Col. W. R. Smyth for work in the forests of Great Britain, and possibly also on the Continent, left recently for Halifax, where they will spend some time in training before embarking for England. The regiment, which was recruited in a very short period, is something like 200 men over strength. A base company will be left over to join the 242nd Forestry Battalion, now under formation by Lieut.-Col. J. B. White, with headquarters at Montreal.

Dealer's Interest in Proper Painting

By R. H. Brooks

As a prologue to the subject of painting it appears pertinent to bring out one or two phases in the prosecution of the retailer's daily business that are closely related to the point at issue and yet which may have been overlooked by some of you. Therefore, this question:

Next to yourself, your family and your employees, what persons are most concerned in your lumber yard and the fact that you are a lumberman? Perhaps your answer is already on your tongue. In the majority of cases it is your creditors, the tax assessor and your immediate neighbor, who grows nervous when there is a high wind at night which blows from your direction.

Have You Done Your Part?

Have you, as a merchant, with a useful commodity to sell, done your part in helping your customer by selling him the wood best adapted to certain purposes, and have you kept faith with him in advising and counselling him in the uses of such wood? If you have, then each man or woman so treated is also interested in your business in more than an impersonal way, because you have done that vital thing which lifts you out of the storekeeper class and on to the higher plane where are found the successful merchants of this country, namely, to a place among those who render merchandising service. Did you ever stop to consider that service is the greatest profit getter known in business and that the more persons to whom real service is rendered the greater the returns? "Service" is a threadbare over-worked and much abused word, but it embodies in its widest sense every factor in commerce which makes for success. In your case it means that you tee your ball on reliable lumber; that you drive with honest sales arguments and that you follow through with your personal interest in seeing that each wood is used where the Lord meant it to be used and where you, as a God-fearing lumberman know it should be used.

Value of Enthusiasm

"Familiarity breeds contempt, but respect begets admiration." Do not get over familiar with the woods you handle, but rather respect them, study them, know them, and then you can admire them. Once you admire them you become enthusiastic. Following enthusiasm comes a desire to tell the other fellow what a fine thing such and such a wood is, and right away you have your man more interested in what the wood you are boosting will do than in what it costs. By boosting I do not mean merely superficial talk, but rather the expressing of a deeply founded, sincere admiration for the product.

I can perhaps best convey to you the attitude of the average retail lumberman towards his stock by relating as an instance a thing which we experienced during our exhibit at the Complete Building Show held at Cleveland. While that show was in session the Ohio retail lumbermen held their annual convention there. Of course, many of them visited the building show. Those lumbermen wore little ribbons which told who they were. Our exhibit was clearly identified by easily read signs. Some of those lumbermen stepped in for an inspection, but over forty, whom I personally saw, passed it by with only a look at the sign. I was not offended, nor did I feel slighted, but it stirred me to the core to realize that so many men of my business fraternity, every one of them selling our wood, unconsciously regarded themselves as so familiar with Arkansas soft pine that they could not learn anything new. Yet in that exhibit was information and display material which would have given each of those dealers some new idea and most helpful, valuable advice which it would have profited them to know. Merely emphasizing that familiarity breeds contempt. In passing just grasp this, that while those lumbermen passed by on the other side 122,000 consumers visited that show and a very comfortable percentage of them stopped at ours and other lumber exhibits and asked questions, rubbed their hands on the woods, requested literature, information, painting formulas and facts, which they took home and digested, and, as sure as we are here, a lot of them know more right now about the physical make-up and finishing possibilities of the wood which they saw than do those dealers who will eventually sell them, but who unfortunately think there is nothing new under the sun regarding their own merchandise.

Right Wood for Right Use

Your part begins before it is time to paint. First, sell the proper wood for the right use, either outside or in; then, instead of losing interest beyond the sale, follow through the point of instructing your customer in the proper painting or finishing formula. Some of you may be saying that you cannot do this because you do not know how. Our answer is, if you cannot that is your own fault, for several lumber associations will give you the information by any return mail. The paint manufacturers themselves will do the same thing.

Incident of Cleveland Show

Speaking of painting, during the Cleveland show a woman and her husband were attracted to our exhibit by a frame of finished specimens, one of which was done in white enamel. She exclaimed, "Isn't that a beautiful finish!" but a second later caught sight of the word "Pine" at the top of the frame. "What!" said she, on pine? Why, I have put nine coats of white enamel on my woodwork and it looks worse than ever." I asked her if it was "Georgia pine," and she said, "Yes," but before I could tell her the difference between the pine which she knew as Georgia pine and the pine of our state she flounced out of the booth with a final "Never again!" The whole trouble with that good woman was that an indifferent lumberman sold her long-leaf yellow pine for white enamel treatment, when in the general scheme of creation it was never intended for any such purpose. Long leaf, as we all know, has its rightful use, but the very qualities which make it desirable for those uses, namely, weight and heavy resinous content, likewise render it less desirable for certain other uses, among which is as a base for white enamel. No applied treatment can prevent the pitch from discoloring the white enamel from underneath, and as this fact has been demonstrated times without number the dealer who continues to sell it for this use commits an offense against his customer and his business and injures the cause of wood finish as a whole. Incidentally, we found out who the dealer was who sold the woman that particular bill. Taking an opportunity to ask him whether he made a point of explaining the adaptability of certain yellow pines to certain uses, his answer was, "No, we just sell it as Georgia pine or yellow pine and it goes." Well, it certainly did go that time. It went so far with that woman that it will never come back, and if she ever becomes a wealthy investor and puts up an office building, for example, depend upon it, her building will be finished throughout in steel trim.

Every Wood Has Its Rightful Place

Every wood has its rightful place and proper use, and as all woods are treated in one form or another with some form of applied paint, shellac, stain, varnish or enamel, there is a proper formula for such one. You as a lumberman should know those formulas or specifications so that you might not only protect the woods which you sell against improper treatment, but, in addition, to naturally impress upon the mind of your customer the fact that you are an authority on building, from the foundation to the painting and decorating. In this connection may I quote from one of the ready-cut house company catalogues just from the press: "We have a long-term contract with the best known and perhaps the largest paint makers in America to supply us with a special extra grade of pure white lead and linseed oil paint. Needless to say, we include paint as an economy and convenience to customers. Sufficient paint is furnished for two coats outside and inside. You will also receive full quantity of stain and varnish—or paint, oil and varnish for interior use—and shellac and putty. Send for our big color card and select the colors you choose for body, trim, porch, floor, etc."

Now that isn't a formula or specification, of course, yet it is service in that it submits suggestions and ideas and, as a matter of fact, the so-called "best known" paint manufacturer probably sends along a set of painting instructions for which the house-building people get the credit, which is merely another instance to indicate the point.

No commodity is adapted to any purpose unless it fulfills that purpose satisfactorily. If you, as a lumberman, neglect to see that the woods you sell are rightfully used and painted, you invite a boomerang against the profit side of your ledger. Certain pines require shellac or filler before stains or enamels are applied, while other species should be stained or treated with white lead first. How many of you know which specification applies to which wood and have told your customer so? You may put your head in the sand and say to yourself that the supplying of such information is outside your field, but if that be your attitude your more enterprising competitor could ask no more desirable competition.

So far as painting in general is concerned, each wood requires individual treatment, and it therefore behooves you to become paint experts as well as lumbermen, in order that you may render the sort of service we have mentioned. More good lumber has been discredited with the public through the ignorance and misguided prejudice of the ordinary painter and the use of inferior paints than we have any means of accounting, and as long as you neglect your duty in this direction you will suffer the effects. Doubtless every one of you now recommends cut iron and galvanized nails when you sell a shingle bill. You had to come to it because you finally convinced yourself that the wooden shingle itself is one of the best roofing materials in the world if properly laid. Well, then, just so is each lumber the best material for a special use if properly painted. In a way, the paint people themselves have set the pace for us. As far back as 1904 they established the educational bureau of the paint manufacturers of the United States, first as an advertising scheme and later as a combined publicity and research bureau. In the twelve years of their existence they have accomplished many things which have created service ammunition for retail lumbermen, but of which, also, the latter have

been slow to take advantage. For example, according to their booklet, a chemical laboratory and later a physical laboratory, was installed, in charge of the scientific section, which promptly began a series of investigations, the results of which have made an ineffaceable mark on the paint industry. An appropriation was made for this work and a series of paint formulas was selected for the tests, the range including what were believed to be good as well as bad. The material, as well as the work of preparing these test paints, was voluntarily contributed by a number of the leading paint manufacturers of the country.

During the following year North Dakota being far distant from most of the paint manufacturing centres, and the wear on paints in North Dakota appearing to be slow, it was decided to duplicate the North Dakota tests at Pittsburgh, in conjunction with the Carnegie technical schools, and at Atlantic City, with the co-operation of the American Society for Testing Materials. Ground for two test fences was lent by the Carnegie schools and the Pennsylvania Railroad, respectively, and in due time the fences were erected, the painting work being done under the supervision of men designated by the Pittsburgh and Philadelphia Master Painters' Association.

Test Made at Nashville

Later in 1910 a similar test fence was erected in connection with the Tennessee State Food and Drug Commission, on the State Fair grounds at Nashville, Tenn. This test included, at the request of the U. S. Forest Products Laboratory of Madison, Wis., tests of a number of grades of wood turpentine prepared for use as volatile thinners in paints.

Now, take shingles. In 1912 the Fire Prevention Association instituted a campaign against shingle roofs and incidentally against the use of wood in general as a structural material, and several cities passed ordinances prohibiting the use of shingles for roofs. The paint bureau got in touch with the lumber associations and their technical experts with an offer of co-operation, which was gladly accepted. A series of tests was instituted and a preliminary report was made thereon in Bulletin No. 42. Later work proving conclusively that a painted roof does not take fire from firebrands, cinders, etc., a tabloid was issued on the subject. At the same time the paint bureau recommended that members print upon their envelopes the words, "Paint your roof and prevent fire." Many of them have promptly adopted the suggestion. The effect of this work increasing the use of paints for roofs has already manifested itself. In one case a single contractor wrote for advice in connection with the painting of the roofs of 100 frame buildings. Had he been able to get that advice from his lumber dealer, that dealer's moral stock would have risen 100 per cent. in that contractor's mind.

All of which may be included and concluded in these words, if you would profit as a lumberman, know your own game from A to Z and give your customers the benefit of your best knowledge.

Logging Costs for Southern Pine

Lumber manufacturers in Canada are naturally interested in anything pertaining to the production of southern pine, because many of the lines of lumber produced in Canada have to compete with southern pine in most of their principal markets. Our readers will be interested therefore, in the following discussion of logging costs presented by Frank Schopplin at a recent meeting of the Southern Pine Association:

The records of the Association, Mr. Schopplin said, indicate that the various companies reporting their logging costs to this association for the first three months of the year 1916 took their stumpage into account at amounts ranging from $2.00 to $7.00 per thousand, log scale; and the average for all companies was $4.88 per thousand feet, log scale, or $3,986 per thousand, board measure.

The difference in stumpage between log scale and board measure is, of course, caused by overrun, and this question of overrun is probably one of the most mooted questions in the lumber business, as it is affected in so many ways, by a diversity of causes: First, the different log scale rules in themselves give different results as to overrun, and then the same rule applied in different ways produces different results as to overrun. Overrun is further affected by the method of deducting for defects in logs; by the manner of slabbing; by the character of edging done and by the judgment of the trimmerman in trimming the lumber, and, of course, by many other causes too numerous to mention here. As an illustration of this point, the records show that for the three months' period above mentioned, some of the companies reported their overrun as low as 5 per cent. and others as high as 58.3 per cent., so that it will readily be seen that there is a very great variation in the question of overrun itself.

The logging costs, on the form used, are divided into the following headings: Stumpage, cutting, skidding, loading, spurs, transportation, and total cost of logs in pond.

Under stumpage, of course, is taken up the cost of the timber standing in the trees.

Cutting covers the cost of severing the tree from the ground and this cost is affected largely by the locality of the timber, character of labor obtainable and to some extent by the height of stump. The average cost of cutting of all companies reporting for the three months' period was $0.385 per thousand.

Under skidding is taken up the cost of getting the logs from the stump to the upper tracks, preparatory to loading on cars and bringing into the mill. Of course, the cost of skidding is affected by the method employed; by the contour of the country; by the density of the standing timber on the ground, and very largely by the weather conditions. The methods employed range all the way from the bull tractor to the four-line rehaul skidder, and the average cost of skidding, as shown by the records for the three months' period, was $1.023 per thousand.

Under loading is taken up the cost of loading logs from the skids on log cars for transportation to the mill, and this, of course, is affected not only by the size of the trees, but by the method of cutting the logs; that is, whether the logs are cut short in the woods or cut to longer lengths and cut to the desired length at the mill, and it will also be governed largely by the method of loading used. The average cost of loading for the three months' period, according to the figures, was $0.239 per thousand.

Under the cost of spurs is taken up the cost of laying, lifting and maintaining tram track to reach the timber, and this is an item that will show a very great variance with the same efficiency in the work, according to the contour of the country.

Under transportation is taken up the cost of what is known as the "main line" railroad, or the road from the mill to the point of concentration of logs in the woods and the cost of operating the necessary train crews to bring the logs into the mill. This is naturally affected by the distance the timber is from the mill, the character of the country through which the road runs and the grades that are encountered in handling the trains over same. The average cost of transportation for the three months' period was $0.911, making the total cost of logs in pond, for the three months' period, according to the association figures, $7.141 per thousand.

From the Canada Lumberman of Thirty-five Years Ago

Paper Pulp from Wood:—The following is a description of the process of making wood pulp: The wood, four feet in length, and of any thickness, is brought in at the basement of the manufactory, placed in the barking jack (one stick at a time), where two men with draw knives rapidly peel off the bark. It is then conveyed by an elevator to the first floor, sawed in two-foot lengths with crosscut saws, and passed on to the rip-saw, where it is slabbed (that is, a small portion of wood on opposite sides taken off), to permit it resting firmly in the grinding engine. It is then passed to the boring machine (an upright 1½ inch auger, with foot attachment, driven by power), where the knots are bored out. The wood is then placed in racks of the same size as the receptacle in the grinding engine, and carried out to be ground. The grinding engines are upright, and receive at a filling one-twentieth of a cord of wood. The wood is placed in a receptacle, and by a simple variable, automatic feed process, is pressed flatwise between two outward revolving rolls, composed of solid emery, which are flooded with a spray of water, carrying off the filbrilized pulp in a stream through revolving screens to the tank or stuff-chest in the basement. It is then pumped into a vat which forms part of the wet machine. In this vat is constantly revolving a large cylinder faced with fine brass wire-cloth, which picks up the particles of pulp out of the water and places them on the felt (an endless piece of woolen goods which makes between rolls, for different purposes, a continual circuit of the wet machine). On the cylinder is turned a heavy roll, called the "couch"; between the two, where they meet, the cylinder leaves the pulp, with most of the water pressed from it. The pulp now makes its appearance on the felt above the concha roll in a beautiful sheet, 38 inches in width, and is carried along in a steady flow a distance of about eight feet, where it passes between (the water here being pressed from it) but not beyond two heavy rollers, the upper one iron, the lower one wood; it adheres to the upper roll, which is constantly turning, wrapping it up, and when a sufficient thickness is attained, is cut off by a knife being pressed to the roll, which is attached to the machine for that purpose. It now leaves the roll in a thick white sheet, 36 x 38 inches, where it is received by a boy in attendance on a table conveniently attached to the machine, and folded into a sheet 16 x 26 inches. It is then placed on scales until the weight is 100 pounds, when it is placed in a press and firmly tied into square, compact bundles. It is now ready for shipment to the paper mill.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Wanted—Quotations on 1¼ in. and 1½ in. Hard Maple lumber. J. H. Connor & Son, Limited, Ottawa, Ont. 15-16-17-18

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Lumber Wanted

We are in the market for a quantity of Birch, Soft Elm, Hard Maple and Basswood, dry stock, for immediate shipment. Will be pleased to receive full particulars as to quantity, grade, and lowest prices. Apply, The London Lumber Co., Ltd., London, Ont. 18-21

Wanted

We will purchase several million feet of Spruce, Norway and Jack Pine 1 in., 2 in. and 3 in.; state how the stock is piled as to widths and lengths and quantities now on the sticks in each width and thickness; we are also interested in a limited quantity of 1 in. Mill Run White Pine. Advertiser is a large concern and buys for cash only. Apply Box 441, Canada Lumberman, Toronto, Ont. 17-18

For Sale-Lumber

For Sale

1 car 1 x 4 in. and wider, 37 in. long.
1 car 1 x 4 in. and wider, 31 in. long.
1 car 1 x 4 in. and wider, 22 and 25 in. long.

Dry Quartered White Oak, Clear 1 face 2 ends and 2 edges, 2 years old, nicely figured, Ohio stock. Write us for delivered prices.

PROBST LUMBER COMPANY,
18-21 Cincinnati, Ohio.

For Sale

One car 3-in. Practically Clear White Oak, all 12 ft.

Two cars 1½, 2, 2½, and 3 in. No. 1 Common and Better Dry Red and White Oak, all Ohio stock.

The Probst Lumber Company,
15-18 Cincinnati, Ohio.

For Sale

Three carloads of 1 in. No. 2 and 3 Common Maple. The Bradley Company, Hamilton, Ont. 18-19

Cedar Ties

Wanted a buyer to contract for 10,000 No. 1 and 2 Cedar Ties, for next spring delivery. Box 447, Canada Lumberman, Toronto, Ont. 18-19

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

We have the following stock for immediate delivery:—

50,000 ft. 3 x 6 Hardwood Hearts, mostly Maple.
25,000 ft. 4 x 4 Hardwood Hearts, mostly Maple.
200,000 ft. 1 in. Hardwood crating, principally Maple and Birch.
100,000 ft. 1 in. Birch, No. 2 Common and Better.

The Pedwell Hardwood Lumber Company,
18-t.f. Toronto, Ont.

For Sale-Machinery

Saw Mill Machinery

Complete equipment for 40,000 capacity mill, including belts, conveyors, etc., with or without boilers and engines. For sale cheap to quick buyer.

St. Maurice Lumber Company,
15-18 Gaspe Harbor, P.Q.

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

For Sale
Woodworking Machinery

1 Jackson-Cochrane 54-in. Resaw; 1 Cowan 42-in. Sander; 1 Jackson-Cochrane 36-in. Sander; 1 Egan 36-in. single Surfacer; 1 McGregor-Gourlay 2-drum 30-in. Boss Sander; 1 Egan 30-in. 2-drum Sander; 1 C. M. C. 8-in. 4-side Sticker; 1 No. 108 Berlin 30-in. double Surfacer; 1 Ballantyne 12-in. Sticker.

P. B. YATES MACHINE CO., LIMITED,
17-19 Hamilton, Ont.

Wanted-Machinery

Boring Machine Wanted

Wanted a second-hand double bit boring machine, suitable to the manufacturing of Birch Shims. Must be in good working condition. In answering this ad. state the price and make of machine. Box 456, Canada Lumberman, Toronto, Ont. 18-18

Saw Mill Wanted

We require a saw mill, capacity about 40,000 feet daily. Machinery, boilers and engine must be in good condition. The Field Lumber Company, Limited, Field, Ont. 18-18

Refuse Burner

Wanted to buy one brick-lined refuse burner, 30 feet in diameter. Address with all particulars, "Burner," Box 446, Canada Lumberman, Toronto, Ont. 18-19

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

EXPERIENCED LUMBER WOODS CLERK wishes to make a change. With same company several years. Good references. Box 434, Canada Lumberman, Toronto, Ont. 16-18

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

WANTED POSITION AS LUMBER SALESMAN—15 years' experience in hard and soft woods. Connection Eastern Ontario and New York State. Married man, 37 years of age. Apply Box 442, Canada Lumberman, Toronto, Ont. 17-18

POSITION WANTED BY EXPERIenced Office Clerk (lady), three years' practice. Timekeeping, Pay Rolls, Shipping Bills, Cashier, Typing; or any line of office work. Lumber company's plant, Quebec or northern New Brunswick. "Lumber," Box 451, Canada Lumberman. Toronto, Ont. 18-18

MAN EXPERIENCED IN THE MANUfacture and sale of woodenware of all kinds, including household utensils, toys, etc., is open for position as manager or sales manager. Results guaranteed. Woodworking concerns looking for profitable lines to manufacture should communicate. Address, Specialties, Box 450, Canada Lumberman, Toronto, Ont. 18-18

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

BAND-SAWYER Wanted, and a few all-around machine men for furniture plant. Inquire, Luger Furniture Company, North St. Paul, Minn. 18-18

EXPERIENCED SHINGLE GANG wanted to saw, joint and pack season's cut white cedar shingles. The Pearce Company, Limited, Marmora, Ont. 18-18

WANTED a good Ontario White Pine grader to go to British Columbia as shipper and grader. Climate mild and salary good. Apply Box 443, Canada Lumberman, Toronto, Ont. 17-18

A few good saw mill men wanted, good board and lodging, steady work until snow flies.

JOHN B. SMITH & SONS,
17-19 Callander, Ont.

Business Chances

SAW MILL FOR SALE—Capacity 25 M. ft. per day. Located in Alberta on two trunk line Railroads, with good Spruce timber available and good market for lumber. Would like to sell an interest to practical sawmill man who would operate it. A good money-making proposition. About seven thousand dollars required.

Address, G. M. POOLE,
P. O. Box 1353,
17-18 Edmonton, Alta.

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, crosscut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.

Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

Miscellaneous

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of December next for the right to cut pulpwood and pine timber on a certain area situated on the Pic River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet, board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for twenty-five thousand dollars ($25,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $25,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, August 28th, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 18-22

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,000 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 18-21

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Pacific Logging Congress Annual, October 26-28

The eighth annual session of the Pacific Logging Congress will be held at Portland, Ore., and Grays Harbor, Wash., October 26, 27 and 28. This meeting will be preceded by a two days' convention of the Western Forestry and the Conservation Association. These two meetings are among the most important held annually on the Pacific coast covering the timber and logging industries. The trip of the Pacific Logging Congress to Grays Harbor will be as guests of the Polson Logging Company, the largest logging concern in the northwest, and the Grays Harbor loggers.

Blister Rust Alarms Wisconsin

The white pine blister rust, which has been attacking pine forests in the east, has made its appearance in Wisconsin and has so alarmed the state authorities that the department of agriculture has placed a strict quarantine on the importation of any pine nursery stock. J. G. Sanders, state entomologist, in an outline of the discovery of the pest, the nature of its growth and spread, and the danger of its existence, says:

"The dangerous nature of this disease has not been fully realized even by state officials, but the federal department has recently taken active steps toward the control of the situation in the several states where the disease is known to occur and is seeking for evidence of undiscovered outbreaks.

"The insidious nature of the disease and its peculiar habit of working on two entirely different host plants combine to make it a most dangerous pest. In some of the Eastern States I fear that sufficiently drastic measures were not taken for the control of this disease when first discovered, with the result that it has spread to a considerable degree and has been discovered to be established in six or seven of the Eastern States.

"Early this summer the disease was discovered in Polk County at Lake Waupogasset on plantings of white pine trees which originally came from Germany. Although these trees were imported in 1912 and were infected previous to their importation, the fruiting stage of the disease did not appear until last year.

"On account of the fact that the infected and fruiting pines were planted over the entire island, and having in mind the serious danger of reinfection, we decided to destroy absolutely every white pine, large and small, on this island to the number of 4,000.

"If this disease should escape into the native timber, it would rapidly spread and in a few years the growing of white pine and the propogation of new plantations would be hopeless. In this way the future of the lumber industry would be seriously hampered for all time."

Shipping Oak Ties to France

A Charleston, Miss., company has begun to load 50,000 white oak ties as the first shipment of a large contract with the French Government. The second shipment left on September 1. Beginning about July 1 the company began to operate its mill night and day to fill contracts with the French Government. Whether these ties are to be used in laying tracks for railroads to haul munitions of war to the firing line or for quick mobilization of troops, or are being purchased in anticipation of a cessation of hostilities and the rehabilitation of French railroad lines destroyed by the war, is not known.

Redwood Posts Used on Highway

The Lincoln Highway between Salt Lake City and San Francisco, Cal., will be marked with redwood posts, one post to each mile, the distance between the two points being 1,000 miles. These posts will carry a sign indicating that it is the Lincoln Highway. The posts are 4 x 4—12, and taper at the top. They will be set rough and will require no painting to protect them from the weather. Each post will be stenciled "Redwood from California's Big Trees."

Furniture From Sawdust

A new manufacturing corporation has been formed at Sheboygan, Wis., to make furniture out of sawdust, according to processes upon which the government forest products laboratory at Madison is now working, in its efforts to utilize sawmill waste. The furniture will be of twisted and hardened paper, and this concern will be the third similar company to be formed in Sheboygan in a few months.

Shingles Lasted Fifty-Six Years

The story of ancient lumber being used again, after years on an old barn, is told by T. E. Allen, of Lebanon, Wis., who recently decided to re-shingle his barn, after the old shingles had worn fifty-six years. When the shingles were removed they were found so sound that they were used to roof a shed on the same farm.

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company**, of Easton, Md., after giving the "Morehead" system a thorough trial.
Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—
—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.
Save **fuel** by bringing the pure condensation directly back to the boilers HOT!
Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.
Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

Canadian Morehead Mfg. Company
WOODSTOCK, ONTARIO

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario continues along much the same lines as have prevailed throughout the summer. There is a fair demand only, in the larger centres, being the result almost entirely of the activity of the manufacturing interests, such as furniture producers, farm implement manufacturers, etc. The building trade in the cities continues to show no life worth mentioning. During the last week of August and the first week of September wholesalers report that the country retail trade showed a moderate improvement. It is expected that this will be the commencement of a fair amount of trade during the fall. Ontario farmers have done exceptionally well this summer with most of their crops and products, and are in a good position to purchase lumber in considerable quantities. Moreover, they are, in a great many cases, in actual need of lumber for new buildings, alterations, repairs, etc., which have been postponed from time to time during the past year or two. Country retailers report that this demand is now developing and is responsible for the improvement of the past fortnight.

The controlling factor in connection with the lumber producing industry in Ontario continues to be the great scarcity of men. The situation is daily becoming more critical. A wholesaler who recently called on a number of Northern mills states that it has now become almost impossible for the manufacturers to ship their stock in anything like the quantity required by the trade. All wholesalers report that they have orders in at mills for numbers of cars which they cannot obtain. In conversation with bankers regarding this subject lumbermen are invariably told that they must be patient, and bear in mind always that the most important matter to be attended to to-day is the prosecution of the war, and that, so far as the shortage of labor and the inability of railroads to handle shipments are concerned, it is up to manufacturers, wholesalers, and retailers to accept what they can get and make the best of it. This does not mean that the trade should lie down and wait for something to turn up, but that everyone, in addition to doing what he can to keep the wheels of industry on the move, must also be patient in regard to the matter of deliveries.

While the manufacturers at Northern Ontario points are having trouble making shipments, the likelihood is that long before next spring the available stocks at mill points will have been greatly depleted, if not almost wiped out. A prominent wholesaler, discussing this point, reported that a year ago he had plentiful stocks on hand at mill points, whereas to-day nearly all of his stock has been shipped out, and every foot of it has been sold. Moreover, he is finding it difficult to obtain small lots, of, say, one to five car loads, at scattered points where he formerly was able to dig them up without much difficulty. The same condition he reports in connection with hardwoods, stating that the 1916 cut has all been shipped out, so far as it is fit to ship.

Eastern Canada

The demand for shell box lumber at Montreal is again the chief feature of the trade. The Imperial Munitions Board recently placed another order for 250,000 Bethlehem boxes at Montreal, and this calls for a large quantity of 1½-inch stock, which at present is scarce. There is also a good demand for ordinary boxes for commercial purposes, and wholesalers are finding the box trade an interesting end of the business. Otherwise business is slow. Wholesalers at Montreal, in common with those in other centres, are looking for an advance in the cost of lumber next year, as a result of the scarity of labor, high wages, advanced cost of food and equipment, etc., in connection with logging operations. The export trade from Montreal to Great Britain is quiet. The Government is taking up a large quantity of vessel space, leaving only a little for lumber shipments. Rates, however, are a trifle easier, but not low enough to bring out much demand.

Spruce quotations at Boston have recently shown an advance. August trade was unusually good. Wholesalers and manufacturers who sell direct to the retail trade are taking nothing less than $27 base for frames, an advance of $1, and within $1 of the record high price last spring. Quotations for frames now are as follows: 8-inch, $27; 9-inch, $28; 10-inch, $29; 11-inch and 12-inch, $30. Randon quotations are also firmer, at the following range: 2 x 3, $21 to $22; 2 x 4, $22 to $23; 2 x 5, 2 x 6, and 2 x 7, $21; 2 x 8, $24.50 to $26; 2 x 10, $26.50 to $28; 2 x 12, $27.50 to $29. A falling off in the demand for spruce is reported from New York, but as stocks at mill points are low, it is expected that higher prices will soon prevail. The building outlook is fair, but the yards are holding off and purchasing only what they require from day to day. A better demand for hemlock is reported at Boston, and prices are stronger. A satisfactory volume of hemlock business is also in progress at New York.

Shingles are firm and active at Boston. Nice white cedar extras are bringing $3.50 to $3.60 and clears $3.10 to $3.30, but the lower prices will not bring out the best of this grade. Red cedars are not so active. Lath have been rather unsteady. Manufacturers of spruce lath are quoting $4.25 for 1⅜-inch, but some large retail buyers say they can obtain stocks at $4.15 and even $4.10. For 1½-inch lath the prevailing price is $3.65.

United States

The removal of a fear of a general strike among the employees of railway companies in the United States engaged in the operation of trains has resulted in business returning to its former encouraging activity. The expectation is now general that during the fall and winter season the industries of the United States will experience the busiest time they have had in recent years. Although the lumber business has been rather slow to respond to the general prosperity, its condition now is more favorable than at any former time since early in the present year. Complaints of car shortage are numerous from the chief producing centres, though this is more particularly the case where there is no competition among railroads for the trade. The approaching demand upon the railroad companies for cars for the removal of the crops is causing retailers to anticipate their requirements to a fair extent. Retail stocks, as a rule, are not now large. In many sections they are, in fact, below normal.

Reports from the Southern pine manufacturing sections are all encouraging, so far as the market situation is concerned, but they all refer also to the scarcity of cars for shipment. The policy of curtailment which has been in operation for some time now is having a good effect upon the market for Southern pine. The Northern pine trade at Chicago shows no change during the past fortnight, the volume of trade being only moderate. Improvement is expected in yard and factory buying in the near future. Prices continue firm. At Buffalo the trade in Northern pine is a little larger than it was a short time ago, and wholesale yards are busy getting out orders that were held up by the threatened railroad strike. Orders for future delivery are not very plentiful, but are increasing to some extent as the vacation season passes by. Wholesalers at Buffalo are finding it necessary to add to their stocks by rail deliveries more than usual, on account of the scarcity of boats and the high freight rates. Increased sales of Northern pine are reported from North Tonawanda, and prices have stiffened. There is a good demand for nearly all grades, and some wholesalers are predicting an unprecedented shortage of desirable stock when navigation closes this year. There is a healthy demand for hemlock at Buffalo. Country dealers are coming into the market more generally than they were during August. Prices are steady at the slight advances recently reported. Improvement is also reported in the hemlock market at North Tonawanda. Wholesalers are getting some of the business that yellow pine dealers are unable to handle promptly. Prices are stronger, and further advances are looked for.

Great Britain

A little better tone is reported in connection with the spruce market in Great Britain, especially in regard to deals. Business, however, cannot be described as active. The demand for spruce continues good, but the heavy drop in all wood values has created some nervousness about paying prices above the current market figures. Canadian shippers are holding out firmly, and the result of the disinclination of both sides to come together is a reduced volume of trade.

The spot market at London has been quiet, as most merchants are still on the cautious side. The requirements of the forces are still extensive, and are likely to continue so for some time to come, but other large consumers are very quiet. Deliveries at London docks during the week ending August 19 amounted to 11,588 standards, as compared with 4,944 standards during the corresponding week of last year.

At Liverpool the principal demand is for Government requirements, and even in this line there has been a somewhat reduced activity. Prices at Liverpool are stiff, with an upward tendency in spite of a limited demand. The possibility of much higher freight rates is influencing merchants' ideas of values.

At Manchester the timber trade at present is only in moderate volume. One of the most extensive sources of consumption is the demand from the railway companies, which continue to use very large quantities of timber. The general industrial situation at Manchester is good, and is leading some of the chief manufacturers to express the opinion that there will not be any depression of a lasting character after the war. In connection with this question, manufacturers are foretelling that the trouble after the war will be much the same as it is now, viz., a shortage of labor, not of work.

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Montreal Trade Slightly Improved

Montreal, September 11th; (Special to the Canada Lumberman): The demand for shell box lumber is again the dominating feature of the market. Additional orders for boxes have recently been placed here by the Imperial Munitions Board, including one for over 250,000 "Bethlehem" boxes. These call for large quantities of 1½ inch stock, which is difficult to obtain. Box makers are also busy on ordinary commercial boxes. The result is that wholesale lumber firms who are specializing on this business report that trade has lately improved considerably. In other directions, business is slow, although dealers state that, except for pine, prices are keeping very firm.

Wholesalers are generally of opinion that we must look forward to a substantial rise in prices next year, as the result of a short cut, due to labor scarcity and higher production costs generally.

An encouraging sign is the increase in the value of building permits. For the second month in succession, there is an increase on the period in 1915. During August the total was $601,340, a gain of $291,575; while for the eight months the value was $3,581,554, a falling off of $579,808, as compared with last year. Although the bulk of the work is for small properties, of late there have been several projects for building factories.

Only a small amount of lumber is being sent to the United Kingdom. Space is restricted, owing to Government requirements, and although rates are a trifle easier, they are not sufficiently attractive to induce large shipments even were room abundant. Unless there is a considerable impetus to exports, of which there is no prospect at present, the season will show a very material falling off as compared with last year.

The persistent demands for sulphite pulp have left the mills with only a very small stock for immediate requirements. Prices are exceptionally strong, and so far as can be judged, there is no indication of any break in the market. In fact, the chances are that quotations will go still higher. A considerable quantity continues to be shipped to England. Ground wood is also firm. Newsprint mills have a ready market for all their production, and with the good outside buying prices are very stiff.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled, is furnished by the Quebec Supervisor of Cullers' office under date of September 7th:—

	1914 Cubic Ft.	1915 Cubic Ft.	1916 Cubic Ft.
Waney white pine	546,240	395,120	140,160
White pine	.....	.....	....
Red pine	1,040	.....	.....
Oak	292,560	104,960	286,960
Elm	299,280	46,840	69,440
Ash	680	840	1,680
Butternut	.....	.....	40
Birch and maple	50,800	48,880	46,880

St. John Shipments Show Increase

The following comparative statement shows lumber shipments from St. John, N.B., to the United Kingdom, Continent, and South Africa, for the six months from January 1 to July 1, 1915 and 1916:—

	1915	1916
Spruce, superficial feet	63,611,539	74,827,393
Hardwood, superficial feet	805,218	741,484
Birch timber, tons	206	.....

China to Be Big Lumber Market

Julean Arnold, United States commercial attache for China and Japan, now visiting various cities in the Pacific Northwest, is confident that China will some day develop into a great lumber-consuming country whose requirements will naturally be largely supplied by North Pacific mills. At present China is not buying any great volume of lumber because of high ocean freight rates and scarcity of available tonnage. Just before the European war China was consuming about 161,000,000 feet of softwood lumber a year. Generally the Chinese people are now learning the value of lumber as a building material, and, with all conditions favoring important development of the country, the Chinese nation seems almost certain to become a great lumber-using people, wholly without merchantable softwood resources of their own.

Western United States Trade Conditions

The West Coast Lumbermen's Association, in a bulletin under date of September 8, say: On a market admittedly weak in price a fair volume of new business was placed with Pacific Northwest sawmills last week. Car shortage in Oregon caused transcontinental shipments to drop off, but the decrease was more than made up in cargo and local shipments. Water business, while showing increases both in orders and shipments, continues discouragingly below normal.

Production of lumber has gone slightly above normal. This is partially explained by the fact that there is now a tendency to accumulate stocks at the mills, owing to badly broken assortments and in anticipation of at least normal fall buying of retail yard material.

Orders are below normal production, 4.58 per cent. on 3,201,570 feet. Orders are below actual production 8.33 per cent., or 6,056,998 feet. In comparison with the previous week orders show an improvement of 1.46 per cent.

Prince Albert Mills Exceptionally Active

H. J. Weinrich, who is in charge of employment for the Prince Albert Lumber Company, reports that 5,000 men will be required this winter for the logging operations in the Prince Albert district, Sask. This is the largest number ever employed. He reports that the demand for lumber is very heavy and that employment can be found for every man obtainable. The company's mills are being cleaned out of lumber as fast as it is run through the mill. The company will build eight new camps and will hire 4,000 men, while the Finger Lumber Company and other firms will hire at least 1,000 men. The annual output of the Prince Albert and Big River mills, operated by the Prince Albert Lumber Company, is placed by Mr. Weinrich at 100,000,000 board feet, and that of the Finger Lumber Company at 25,000,000. The Prince Albert Company's limits will keep them cutting at the present rate for twenty years.

Trinidad Lumber Imports

Imports into Trinidad, B.W.I., during the last three calender years include the following:

	1913.	1914.	1915.
Wood and timber—Undressed	35,592	52,409	24,631
Dressed	17,746	31,234	16,797
Wood, manufactures of	33,288	34,792	13,130

Stocks at Liverpool and Manchester.

The following report upon Liverpool and Manchester stocks for the month ending August 31st, 1916, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N.B., representatives, John E. Moore & Company, Limited.

159 Queen Victoria Street, LONDON, E.C., ENG.

War Time Opportunity

Canada has another big war opportunity. Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc. have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods. The cost of installing plant is small and you make a sure profit from waste material.

WRITE US FOR DETAILS

We have imported ninety per cent. of the Canadian Wood Pulp supplied to Europe since 1899.

South Africa Market Important to Canadians

A report from the Canadian Trade Commissioner at Cape Town, South Africa, published in the weekly bulletin of the Department of Trade and Commerce, states that since the departure of Mr. H. R. MacMillan from South Africa, special efforts have been made to secure cargoes of Douglas fir which were cancelled owing to shortage of available tonnage. Scarcity of tonnage from eastern Canada has held down the exports of eastern wood, as about only one-third of the quantity on order has been delivered. During the latter part of 1914 and during 1915 the supply of Scandinavian and Russian wood was very limited, but during the past four months of 1916 good supplies have come forward from Swedish ports at only slightly lower prices than the North American quotations. The imports into Cape Town in this period are a record in quantity for this port.

The imports of unmanufactured pine into South Africa during 1913, 1914 and 1915 were as follows:—

Countries	1913.	1914.	1915.
Canada	$ 151,000	$196,000	$148,000
United States	521,000	414,000	240,800
United Kingdom	170	200	5
Sweden	1,254,000	871,000	593,000
Norway	503,000	288,000	159,000
Russia	75,800	98,000	30,600

In addition to the above there was imported for South African Government stores the following quantities of unmanufactured pine:

Countries	1913.	1914.	1915.
Canada	$ 11,200	$ 750	.....
United States	53,500	42,000	$4,800
United Kingdom	500	.....	.....
Norway	10,000	1,000	.....
Sweden	115,000	16,000	.....

For the past three years, trade inquiries have been published for many firms anxious to take up the representation of Canadian box makers, and a number of trade inquiries have been published from South African merchants prepared to purchase in 100,000 lots. Business has not resulted, and it is hoped that some organization will take up the manufacturing of box shooks for export on the most modern plans so that Canada may secure a good share of the present demand as well as that of the near future, which, competent authorities say, will be in the millions of boxes for oranges only.

Several Canadian handle manufacturers are now represented in South Africa by first-class agents and good results should be shown in next year's returns, although it is a hard and long task to substitute the maple handle for the hickory. There is no doubt when the value of the better grade maple handle has been proved to the South African trade, good results will follow. South Africa manufactures annually from a special hard wood, about 20,000 pick handles; all other handles used in South Africa are imported, and the importance of this trade for Canadian maple handles will perhaps be better appreciated by a reference to the quantity of imports of pick, shovel and hammer handles, which number respectively 66,000; 450,000 and 236,000.

The steamer sailings under Government contract from Canada to South Africa have continued to carry lumber in good quantities. The lumber cargoes are not all Canadian timber, but the percentage given to Canadian lumber has increased considerably during the past eighteen months.

Imports of Canadian lumber into South Africa during 1913, 1914 and 1915 were as follows:—

	1913	1914	1915
Doors, bdls.	1,416	1,153	1,645
Box shooks	.....	.....	447
Staves, pcs.	243,368	188,127	155,521
Beaver board, crates	78	363	347
Maple flooring	.....	1,338	.....
Shingles, bdls.	.....	68	68
Deals (sup. ft.)	3,951,387	4,687,989	4,644,362
Lumber (sup. ft.)	4,718,671	1,767,543	2,471,685
Woodenware, pkgs.	506	161	496
Handles, sacks.	2,273	1,671	3,554

B. C.'s Fine Exhibit of Lumber and Timber at the C.N.E.

The exhibit of the B. C. Forest Service at the Canadian National Exhibition this year was a great drawing card to the thousands of people who saw it daily. In conception and arrangement the exhibit was a decided improvement upon anything of its kind that has formerly been seen at the exhibition. It was carried out upon an exceptionally ambitious scale, some idea of which can be obtained from the accompanying illustration. The handsome facade consisted of solid Douglas fir logs and heavy beams. Behind these the smaller exhibits were arranged in six divisions treated in separate woods as follows:—(1) Western soft pine; (2) Western white pine; (3) Western red cedar; (4) Douglas fir; (5) Western hemlock; (6) Western larch and Western spruce. In each section the separate woods were backed up by beautiful panels showing the results secured by various finishes in oil, stain, varnish, wax, polish, etc. In this way the beautiful characteristics of the different woods were shown to the very best advantage. The exhibit contained everything produced in B. C. in the way of timber and lumber of commercial value, including an extensive range of mouldings and turned stock in all the woods. In each case, moreover, the wood was exhibited both as finished stock and as board and plank in various grades. The flooring of the exhibit was of Douglas fir, edge grain. The doors were pine, cedar and fir. In the exhibit there were also three tables 48 inches in diameter, three chairs and one settee, illustrating the use of B. C. woods for furniture production. The table tops were of rotary cut veneer. An exceptionally interesting part of the exhibit was a fine red cedar chest.

B. C. red cedar shingles were shown in all grades, and the exhibit included two sample roofs. Information was given to a great many visitors upon the best methods of laying and nailing B. C. shingles.

The exhibit also included an interesting range of wood products including a boat built in Vancouver, with unfinished lumber, so as to show the class of wood used. There were also oars, finished and in the rough, and a great variety of boxes, including fruit boxes of B. C. spruce, which is odorless and free from defects, making it an ideal package for the conveyance of food. Other features of the exhibit were paving blocks, tight and slack cooperage, wood stave pipe, silo stock, in fir and cedar, verandah posts and balustrades, window frames and a panel from a clear log 9 feet in diameter. The log from which this panel was taken contained 17,000 feet of lumber to the first knot.

Mr. L. B. Beale, B. C. Lumber Commissioner at Toronto, whose offices are in the Excelsior Life Building, was in charge of the exhibit. Its conception and carrying out were planned by him and reflected great credit upon his originality and energy.

British Columbia's fine exhibit of timber, lumber, etc., at Canadian National Exhibition.

Camp Groceries

You can always be sure that we have at all times a good supply of everything that is needed by the cooks in the camp.

Buying in large lots, we can quote the lowest market prices which are prevailing at the time of inquiry.

We solicit a share of your business requirements and will gladly quote and send samples on request.

WHOLESALE GROCERS

Church St. and Esplanade, TORONTO

McLennan's Lath Mill and Bolter

Utilize your unsaleable lumber with a lath mill.

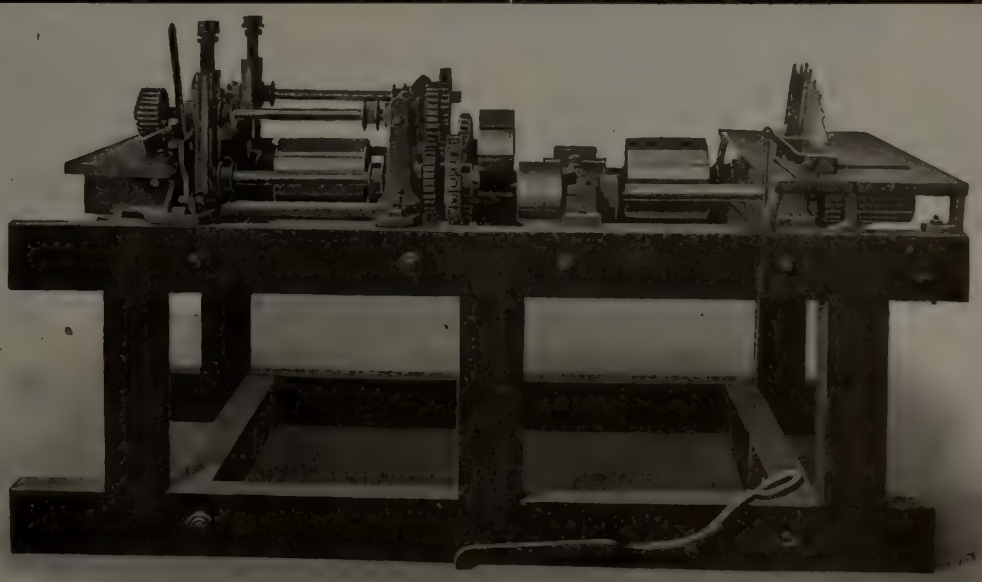
This lath mill and bolter is designed along simple lines with bolted wooden frame, making it inexpensive and substantial.

Capacity 45,000.

Specifications; Lath machine pulley 7 inches diameter x 9 inches face.

Floor space 7 feet 6 inches x 3 feet 6 inches.

We make gang edgers, shingle machines, sleeper machines and barkers, etc.



McLennan Foundry & Machine Works

CAMPBELLTON, N.B. Limited

A Few of the Mistakes I Have Made

It is rather a queer occurrence for one of us to sit right down and "fess up!" Well, they say confession is good for the soul, so I believe if I admit some of my many errors some of you may "soften" and say, "Me, too!" Just like the bashful girl and boy—after the boy pours out his soul to the girl, no matter how well she had guarded her feelings, she generally admits that she, too, has the "same feeling" towards him, says the Lumber Doctor in the St. Louis Lumberman.

Now, you perhaps have heard a thousand times at least that "experience is a good teacher"; so we will admit that fact, and I will tell you just a few things that you can benefit by avoiding.

A couple of months ago I put every account that I considered undesirable on my book onto a separate list. Now, in the first place, don't you ever let two hundred people who are undesirable customers get onto your books. That's bad policy; but if they are there, get your money out of them, if you can. Well, I did get a lot of them to settle—in fact, about one hundred and forty. Now, I still have about sixty of the very worst kind to collect from.

I have tried coaxing, begging, suing, filing liens, garnisheeing, and no telling what. I have not given up very many of them yet, and I won't till they die, and then I'll take a try at what is left by them, which usually is not very much.

I am now working on a contractor who is everlastingly tearing up the sod because I have told him that he must settle up his account, because it had not been "red inked" for twelve years.

Now this fellow quit me cold, and is as mad as a wet hen, and I guess he will cause me all kinds of trouble before he settles with me. Nevertheless, we are going to settle, or get the courts to settle for us. I much prefer the former, but if nothing but courts will do him, he will get the courts.

Of course, some of you will say I should never have let it run on this long, and I guess you are exactly right. But he paid us many a hundred dollars, although he would pay up no certain bills, but just so much on account, and let the thing keep running along, and I kept charging him interest and selling him stuff—and so it got into this shape.

When I ask this man for money he won't answer me, or if I try to stop him and talk to him about the account he won't pay any more attention to me than to a hobo asking for a drink. Now, I have sent him notice that he must set a date to begin to settle, within a week, and I mean just what I say. I should, of course, have made him settle each job within three months and twenty days of the time of purchase of the last material, and then all this would not have occurred, and I could have either fallen out with him long ago or else had him for a good customer now, instead of have him "knocking" me at every opportunity. But I didn't. I lost, and am now telling you how to avoid such things—and perhaps you will take the warning, and perhaps you won't till you get "stung" a bit yourself.

I have another contractor who has failed to settle for six years, who just has a peculiar way of getting the best of everyone he comes into contact with.

He knows how, and just makes use of the valuable knowledge he has accumulated.

Let me tell you one thing: Begin right now, and don't let any job go by the time for filing a lien, no matter who the party is. Make it a rule and stick to it; then they can't blame you. I made it a rule to charge interest and collect it, and I am $10,000 better off by it. Lots of them made rules to charge interest one week and broke them the next.

Run your own business. Don't let everyone come to you and tell you what you must do. By this I don't mean not to take and consider the advice of others, but I do mean don't let your customers bulldoze you.

I have let several "prince-of-soft-silk artists" get me good and plenty, and then refuse some poor devil $5 worth of credit. How many of you will "fess up" to having done this? And yet you know you have.

I have just sued one of them, and will be ten years getting what he owes me, and will have his enmity the rest of my life. Whereas, had I guarnisheed on all the bills he owes me for, I would have the money and, besides, I would have him "pulling" for me.

Had I notified the parties before they paid the contractor whom I have filed liens on for unpaid bills by the contractors, I would be thousands of dollars better off and have a few more customers besides.

Don't be afraid to notify the owner on anything where you doubt the contractor's paying qualities; it is no more than fair. Of course, he may show his appreciation of your kindness by telling the contractor, but you will get your money, and be that much ahead. It is better to fall out at first than after they have you a few thousand dollars to the bad.

A mistake I have not made which, no doubt, some of you have, is to sign contractors' and others' bonds.

This is a great mistake, and lumbermen had better keep off of this practice; and, furthermore, refrain from signing notes for anyone, and you will be thousands of dollars to the good. I have an ironclad contract not to sign anything but a merchant's license bond, and I stick to it, too; and I don't believe I have lost the sale of $100 worth of stuff by so doing.

A mistake that I have just corrected and quit making is that of giving credit for wet and damaged cement sacks. "Hearken unto me, my lads!" don't send out cement or plaster in bad sacks, and don't accept any bad sacks in return. I have a stamp that I put on every ticket that has plaster or cement on it, which says: "Don't accept any bad sacks, as you will receive no credit for torn or wet ones," and I fine any of my help who take out torn sacks, and now I can stand on my refusal to "pony up" for sacks that are worthless to me. Let me tell you that there isn't one of you who hasn't lost money by taking back sacks, stray sacks, and wet sacks. Besides, if you stand for such practice you are not treating your competitor who wants to do business on business principles right. There are a whole lot of us who don't care much for our competitors, but we shouldn't fail to be as decent as we can, for our competitors are seldom as black at heart as they look to us.

A good many of us have made the mistake to send out a lot of advertising under a one-cent stamp. Not guilty here. But I have friends who have done it. Please avoid it.

Another thing to save time and money by is not to fail to put on all sales tickets the address of the purchaser. It saves you money in time that your yard man won't lose by asking the one who makes the ticket, and your yardman and your collector won't have to look up the addresses when they go after the money. Oh, yes, don't forget to make every fellow who receives any material from you on either a cash or credit ticket sign up the receipt. Don't be afraid to demand this; it has saved us many a dollar, and many customers whom we would have lost otherwise.

Another mistake that some of us are still making is to allow beer-canning in our lumber yards and foul language. We have three ladies in our office, and our yard is just as refined as any place of business in the city, and the "can" don't go any more here.

Another way we can load ourselves down with a lot of undesirable stock is to take an order over the telephone and not have the customer sign up a verification slip of it before we order.

One other thing that you must not overlook to avoid is, don't buy everything that is offered you for sale. I have a lot of articles that I have had a hard time trying to move; but they are not going to be a dead loss.

Now, some of those things might move nicely in some communities, but have proven a failure in ours. I am just cleaning up a lot of hog dip that I had on hand for three long years. I have a bunch of paint and wallpaper cleaners and a lot of waterproofing compounds on hand. Some of these are all right, but the others are not. With all these things I have a whole lot of unfulfilled promises of the fellows who sold them to me. They promised to send a man here to canvass with us, and introduce them, but never did. I just traded off a lot of metal weather strips, the kind of strip that rises and drops as the door opens and closes. I traded those back to the firm for some sliding door track and hangers that I sold since and got my money out of them.

Then there is one very important thing. Yes, I believe it is more important than all the rest of them, and that is one that we all have made a great mistake in. It is losing our temper. Now, let me tell you, every time you lose your temper you lose your money.

There positively is nothing in "calling a fellow down good and proper," "telling him what you think of him," etc. Hold your temper and you will hold your trade. It is not necessary to be a "good piece of road" and have everybody run over you when he fees like it, but don't sit around "half cocked" all the time.

When a fellow tells you he only got five pieces of 2/4 by 16 when you know you loaded six on the wagon, or if a fellow says your plaster fell off the wall as fast as he could put it on, or some fellow says your paint is no good, don't call him a liar or swell up about it. There are so many cases where we lose customers just by not being able to sit quietly and let them tell us their troubles, and then explain things to them and give in to them, if they are right, and show them, when they are wrong (if that is the fact of the case). Now, you know you make mistakes. I make mine; and we often think we get sore at some fellow that we buy from for a just reason—although, in truth, sometimes without grounds. So it is with the fellow that buys from us. He has a right to an explanation; and just like us when we go after the fellow whom we favor with our business—if he is a diplomat—he gets us tighter than ever into his grasp, while, if he is an old bear, we quit him cold and never miss an opportunity to "knock" him. We all like to tell about our successful moves, but are loath to tell of our failures. But while, relating our sunshine ventures, we may inspire our brothers to try to succeed. They can learn much by our telling them how we failed and keep them from "driving into the same ditch." Now this may be a homely expression, but you fellows who have been out "just for a few minutes' ride with a few friends," and have gotten into a real ditch and had to ask your friends to walk home, rather than "call a taxi, and let all your friends know that you had a mishap," can certainly appreciate this and will admit that it isn't very "far-fetched."

CAMP FOOD

A whole lot depends on the food your men get to keep them in the glowing health necessary for strenuous camp work. Their food should be made from the best flour it is possible to secure.

Cream of the West Flour

the hard wheat flour that is guaranteed for bread

has the reputation of being the most wholesome, nourishing flour on the Canadian market. Lumber camps are learning more and more, the best is cheapest in the long run.

Your horses need special camp feed, too. Our Crushed Oats, Mixed Crushed Feed and Chop are the very finest grades of feed for camp use. You'll notice the difference in good work done by your horses in a short while after using these products.

Forests and the War

The devastation of the forests by shot, shell, and soldiers in the warring countries of Europe is described by Percival S. Ridsdale, editor of American Forestry, Washington, D.C. He says:

Belgium, the major portion of which is in possession of the Germans, had some forested land, which was, as it might well be termed, more of a scenic than a commercial nature. Advices indicate that these forests have practically been destroyed. Much of the timber was used by the Germans for military purposes—in the construction of trenches, in road building, in the erection of shelters, barracks, etc. Considerable was used for firewood, and it has been stated, with what accuracy it is impossible to say, that timber not used in this way or needed in the military zone has been shipped to Germany for home consumption. Most probably this is so. Before the war Germany imported large quantities of timber from Russia, and in the last few years preceding the war these imports greatly increased. English writers, calling attention to this fact, insinuate that the Germans knew the war was coming and imported as much timber as possible in order to conserve her own supplies, and to be able to provide for the expected large demand by the military in case of war.

As regards Belgium, then, it would not be at all surprising to learn, when the war is over, that there remains on Belgian soil no timber of commercial value; that her scenic forests have been wiped out, and that thousands of her roadside and street trees have been used for fuel and for other purposes by the Germans.

In Northern France, on both sides of the fighting front, great damage has been done the forests, not only by the tremendous bombardments which have marked the fighting there, and by the hail of bullets from small arms which have swept forested spaces, but by the trench builders, the road engineers, and others who needed timber for construction work. Thousands of new roads or passageways have been built for the rapid transportation of guns, munitions, supplies, and men, to thousands of points along both fronts. Many of the roads or passageways are of the type known as corduroy roads, the base being made of tree trunks, overlaid with branches and these branches overlaid with earth. These roads alone necessitate the cutting of thousands upon thousands of trees. In the lining of trenches and the building of shelters there has been unceasing demand for more and more timber, and when it has been on hand in the shape of single trees, groups of trees, woodlands, or forests, it is fair to assume that it has been freely used.

In addition, the destruction by shot and shell is tremendous. Trees that have not been blown down or cut through or shattered have been so badly damaged that they will die; others, pitted with bullet holes or wounded by other shot, are now open to disease or insect attack, while there are long stretches of forested lands where there has been no fighting, not much is known, but the inference is that, owing to the unceasing military demands for timber, the annual cutting is very much greater than it was in times of peace, and this means, doubtless, that practically all timber that has matured has been cut and used, for France, like England, was in times of peace a large importer of timber, and, like England, her supply from Russia, whence most of it came, has been cut off since the war started.

There is no occasion for concern regarding Russian forests, for the losses due to warfare are infinitesimal when compared with her tremendous forest resources. Then, too, even in the forests where there has been severe fighting, the damage done the trees is hardly worthy of note, because the forests are so dense and so extensive. Russia, with her wonderful forests, will have a glorious opportunity for an immense lumber business when the war is over, and if she can take advantage of it she will become the main source of timber supply for all the warring countries of Europe.

Practically no advices have come from Italy regarding any destruction of forests due to the war, nor has much been reported or written about Austria's situation in this respect.

It is certain that Germany has done a great deal of cutting in captured enemy territory, chiefly in Poland and Western Russia, and that she has conserved her own forest resources in the thoroughly efficient and scientific manner in which she has for so long managed her forests, but news of what she has or has not done would doubtless be of some military value to her enemies, and so in America nothing of importance has been heard regarding her forests.

The effect of the war on the forests of the British Isles will likely be the utter destruction of most of them. The war has created imperative need of lumber, and at the same time has cut off England's main source of supply, as well as made prices for what can be imported almost prohibitive. In time of peace England's timber imports were valued at about $215,000,000 a year, and this figure gives some idea of the amount she has needed since the war started. So great is her need, in fact, that already many of her home forests have been cut down, and, as everything must be sacrificed to the war, it is altogether probable that trees on many estates and on many private parks and woodlands have been turned into lumber for barracks and other military uses.

The Canadian Lumbermen's Insurance Exchange

"The Canadian Lumbermen's Insurance Exchange," with head office at Ottawa, is the name which has been given to the new Exchange created as a result of discussion upon insurance for lumbermen which took place at the annual meeting of the Canadian Lumbermen's Association at Ottawa, early in the present year. This Exchange is now operating under the most improved form of mutual protection and is subject to the supervision of the following advisory committee:—W. E. Bigwood, of Graves, Bigwood & Company, Ltd., Toronto and Byng Inlet; Duncan McLaren, of the Union Lumber Co., Ltd., Toronto; Arthur H. Campbell, of the Campbell, MacLaurin Lumber Co., Ltd., Hull, P.Q., with E. D. Hardy and Co., Ottawa, Attorney. The Exchange confines its operations to the better classes of mill property and lumber yards. The cost of operation is limited to 20 per cent. of the premiums, whereas approximately 50 per cent. of the premiums paid to stock companies is consumed in home office expenses, agency expenses and profits. The Exchange will therefore be in an excellent position for arranging reliable insurance at practically the cost of operation. Good risks will not be paying for losses on inferior plants, as is the case in connection with stock company insurance. By confining themselves to the best class of lumber plants and yards, the Exchange will be practically free from the conflagration hazard which often involves a series of heavy losses as a result of a single fire. Lumber plants are so widely scattered that it is impossible for a conflagration to affect seriously more than one operation, except in larger cities, where protection is much greater and where it is an easy matter to regulate the amount of insurance carried for the entire area. The high class of risk carried will also render the Exchange immune from the risk of incendiary fires.

Only sawmills of standard construction with five years' timber supply and some form of protection are elegible for policies with the Exchange, but lumber yards with 100 feet clear space, or over, from mill property, are being written for substantial amounts. Under this plan of indemnity the initial cost to the policyholder is no more than for the same security in other companies of recognized financial responsibility, and any profits accruing from the operations of the Exchange, after providing for losses and expenses, are placed to the credit of the policyholders, thus providing indemnity for lumbermen under the most favorable conditions at actual cost.

Some of the lumber mutual insurance organizations of the United States are returning 40 per cent. dividends to policyholders, and it is expected that the Canadian organization operating upon similar lines will not only be successful from the start, but will be a source of much advantage to those who participate in its benefits.

Turner Brothers, Canada, Ltd., Increase Their Accommodation

To take care of the rapidly increasing demand for goods of their manufacture (asbestos products and Balata belting) Messrs. Turner Brothers, Canada, Limited, Montreal, have just completed the erection of a new building, 400 feet long by 70 feet wide, along the waterfront, giving them excellent facilities for shipping by rail and water. Mr. Gavin Milroy, Managing Director of Messrs. Turner Brothers, Canada, Limited, has just returned from a two months' visit at the factory, Rochdale, England, where he has been looking after the interests of the Canadian branch.

It was announced at the annual meeting of the Laurentide Company, held in Montreal, that the new sulphite plant, with a capacity of 100 tons, will be completed by November. The profits for the year were the largest in the company's history, totalling $1,244,283, an increase of $209,677. The profits from lumber were $101,409.

At the Quebec Exhibition the C.P.R. exhibited a quantity of construction material made from Canadian lumber. The same company also exhibited a number of toys, showing the possibility of this industry in Canada. A number of returned soldiers were engaged in making duplicates of the toys on view.

Canada's exports of forest products during the twelve months ending July, 1916, were valued at $54,642,375. During the twelve months ending July, 1915, the exports of forest products were valued at $44,068,654, and during the twelve months ending July, 1914, the value was $43,400,015.

D. B. Sprague, lumber merchant, Winnipeg, Man., recently visited the Pacific Coast to make arrangements for shipment of large quantities of British Columbia fir to prairie points. He reported prosperous conditions in connection with the retail trade on the prairies.

Lumbermen's and Railroaders' Clothing

Guaranteed Pure Wool Mackinaw Coats, Pants, Shirts, Mitts, Socks, Underwear, Etc., of the Highest Grades.

Bird's Pure Wool Mackinaw Coats with high seven inch collar, close fitting with tab at throat. Sizes 36 to 46.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

EDGINGS

Ontario

It is reported that fire recently destroyed the sawmill and machinery belonging to Geo. McAllister, Guelph, Ont. The loss is estimated at $5,000

Ewing & Murphy, 18 Cameron Street, Toronto, are having plans prepared for repairing their planing mill, which was recently destroyed by fire. The repairs are to cost $6,000.

The McDonald Lumber Company, Webbwood, Ont., have taken over the office and storehouses of Chant and Company at that point and are already commencing operations in the woods.

The planing mill, etc., belonging to A. E. Pedwell, Clarksburg, Ont., was recently destroyed by fire. The amount of the loss is estimated at over $10,000 and the insurance $4,000. A large concrete factory will be erected immediately.

Hanna Brothers Planing Mills, Ltd., have secured a charter to carry on business as manufacturers of sash and doors, etc. The capital stock of the company is $75,000, and the head office is at Fort Erie, Ont. The provisional directors of the company are A. J. Hanna, F. Claus, and A. R. Ellis.

The Pigeon River Lumber Company, Port Arthur, Ont., have been making extensive improvements and additions to their plant, involving an expenditure of $15,000. Two new boilers have been installed; a new boiler house has been built; a brick shaving shed has been erected, new piping has been laid down from the cyclone and a new stack has been erected, etc.

The Department of Lands, Forests and Mines of the Government of Ontario is calling for tenders until December 1st, for the right to cut pulpwood and pine timber on an area situated on the Pic River in the district of Thunder Bay. The area covered amounts to 1,400 square miles. The successful bidder will be required to deposit $25,000 as a guarantee of carrying out the requirements of the tender. He will also be required to erect a pulp mill, which is to cost, with its equipment and machinery, not less than $1,000,000. The output of the mill is to be at least 150 tons daily and employment is to be given to 300 hands on an average throughout the year of ten months. The company will also be required to spend $200,000 upon the erection of their plant during the first year, $350,000 during the second year and the balance during the third year. The terms of the tender also require the successful bidder to erect a paper mill at such time as may be directed by the Minister. The mill is to have a capacity of at least 100 tons of paper per day and a daily output of not less than 75 tons. In connection with this tender the government is introducing a new feature in regard to Crown dues upon pulpwood. Former tenders called for a bonus in cash on the part of the bidder. The new tender requires the bidders to state the amount of bonus they will be prepared to pay per cord of pulpwood taken out. This is the first time that a stipulation of this sort has been included in a pulpwood tender in Ontario, though the same principle has been applied in connection with timber lands for some years.

Eastern Canada

J. H. Starrack, Little Cascapedia, P.Q., recently lost his shingle mill by fire. The plant will be rebuilt.

Pauze & Gohier, lumber merchants and owners of saw and planing mills, Cote des Neiges Road, Montreal, have dissolved partnership.

The sawmill belonging to Alex. Gagnon, Chicoutimi, P.Q., was recently destroyed by fire. The amount of the loss is estimated at about $40,000, with insurance of $15,000.

Work is to start at once on the erection of a sawmill at Magog, P.Q., for D. Audet. The building will be 96 x 85 feet, and is to cost $8,000. The owner will be in the market for woodworking and sawmill machinery.

James Holmes & Son, Doaktown, N.B., recently suffered a serious loss by fire, in which the sawmill and 250,000 feet of lumber were destroyed. The loss is estimated at $8,000, and there was no insurance on the building.

According to a despatch from Fredericton, N.B., the Phoenix Mills at that point are being purchased by Donald Fraser & Sons as an outcome of a settlement of a suit between Jas. Murchie & Sons and Donald Fraser & Sons.

The auction sale of the assets of the St. Simeon Lumber Company, Limited, in liquidation, which was held by Messrs. Lefaivre & Gagnon, 147 Mountain Hill, Quebec, P.Q., resulted in the limits, mills, rolling stock, wharves, equipment, etc., being sold to Napoleon Lavoie (in trust) of Quebec, for $125,500. The stock in trade, valued at $11,309, was sold at 33c on the dollar, to Napoleon Lavoie (in trust). The book debts, amounting to $18,300, were sold at 27c on the dollar, to Napoleon Lavoie (in trust). All the wood remaining in the rivers and lakes and about 1,000 cords were sold for $500 to Napoleon

Lavoie (in trust). The refuse lumber and culls, about 408½ cords, were sold for $225 to Messrs. Auger Rancourt & Company, of Quebec, P.Q.

Western Canada

Harrison & Son, lumber merchants, Neepawa, Man., have been succeeded by the Dutton Wall Lumber Company, Ltd.

Negotiations are under way for the construction of a sawmill on the Capilano Indian Reserve near West Vancouver, B.C.

The Brunette Saw Mills Company, Ltd., New Westminster, B.C., recently lost their shingle mill, boiler house, and log chute at Sapperton, B.C., by fire, incurring a loss of $20,000. The owners will rebuild.

The Northern Pacific Logging Company, Ltd., has been incorporated, with head office at Victoria, B.C., and capital stock of $25,000, to carry on business as timber and lumber merchants, sawmill, shingle mill, and pulp mill proprietors, loggers, etc.

The Dominion Shingle and Cedar Company, Ltd., has been incorporated, with head office at New Westminster, B.C., and capital stock of $45,000, to carry on business as timber merchants, shingle mill, planing mill, and sawmill proprietors, loggers, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 27th day of September, 1916, for the purchase of License X677, to cut 1,956,000 feet of Douglas fir and cedar on an area adjoining Lot 672, Fuller Lake, New Westminster District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 27th day of September, 1916, for the purchase of License X612, to cut 2,390,000 feet of fir, cedar, hemlock, balsam, spruce, and white pine on an area adjoining Lot 561, Green Point Rapids, Coast District, Range 1. Three years will be alowed for the removal of the timber.

The Acorn Lumber & Shingle Company, Limited, are building a shingle mill costing $10,000 at New Westminster, B.C. Mr. M. D. Irvine, Kelley Street, New Westminster, is at the head of the new concern and Mr. John Kelly is also interested. The firm have already been operating in East Burnaby for the past two years. The mill will be equipped with two machines and provision will be made for a third.

Lumber Advances Slow Compared With Other Commodities

"Lumber has gone up in price somewhat in 1916 as compared with prices in 1915, but the increase is far below the percentage of increase in cost of almost any other article in the world of commerce," according to a report by S. Kellogg, Secretary of the National Lumber Manufacturers' Association, based upon a government report of the average values of various species of wood. The increase is not even applied to all species, for some species of wood are actually valued at less this year than was the case in 1915, western pine being an instance. Furthermore, the lumber trade was in a state of depression for many years, manufacturers were cutting and selling lumber at a loss in order to secure money to pay fixed charges on their investments, and what slight advance has been made in the past year should be compared with the great increase in food, clothing and other materials during the past ten years, to give the lumber trade its comparative relation to the rest of the nation's commerce."

The average f.o.b. mill value per thousand feet of the principal kinds of lumber was as follows:—

Softwoods	Average Values Per M. 1915	1916
Yellow pine	$12.50	$15.02
Douglas fir	10.50	14.20
White pine	18.00	18.32
Hemlock	13.00	15.31
Western pine	14.50	14.01
Spruce	16.50	17.33
Cypress	20.00	21.94
Redwood	13.50	16.64
Cedar	15.50	18.12
Larch	11.00	11.91
White fir	11.00	12.91

Hardwoods	Average Values Per M. 1915	1916
Oak	$19.00	$21.76
Maple	15.00	15.53
Yellow poplar	22.50	24.21
Red gum	12.50	13.46
Chestnut	16.00	17.49
Birch	16.50	17.24
Beech	14.00	14.05
Basswood	19.00	18.66
Hickory	23.50	30.42
Elm	17.00	18.08
Ash	22.50	24.35
Cottonwood	17.50	17.15
Tupolo	12.00	14.13

WAR LOAN

DOMINION OF CANADA

Issue of $100,000,000 5% Bonds Maturing 1st October, 1931.

Payable at par at

OTTAWA, HALIFAX, ST. JOHN, CHARLOTTETOWN, MONTREAL, TORONTO, WINNIPEG, REGINA, CALGARY, VICTORIA

Interest Payable Half-Yearly, 1st April, 1st October.

Principal and Interest Payable in Gold.

ISSUE PRICE 97½

A FULL HALF-YEAR'S INTEREST WILL BE PAID ON 1st APRIL, 1917

The Proceeds of the loan will be Used for War Purposes Only.

The Minister of Finance offers herewith, on behalf of the Government, the above named Bonds for subscription at 97½, payable as follows:—

10 per cent. on application;
30 " " 16th October, 1916;
30 " " 15th November, 1916;
27½ " " 15th December, 1916.

The total allotment of bonds of this issue will be limited to one hundred million dollars exclusive of the amount (if any) paid for by the surrender of bonds as the equivalent of cash under the terms of the War Loan prospectus of 22nd November, 1915.

The instalments may be paid in full on the 16th day of October, 1916, or on any instalment due date thereafter, under discount at the rate of four per cent per annum. All payments are to be made to a chartered bank for the credit of the Minister of Finance. Failure to pay any instalment when due will render previous payments liable to forfeiture and the allotment to cancellation.

Subscriptions, accompanied by a deposit of ten per cent of the amount subscribed, must be forwarded through the medium of a chartered bank. Any branch in Canada of any chartered bank will receive subscriptions and issue provisional receipts.

This loan is authorized under Act of the Parliament of Canada, and both principal and interest will be a charge upon the Consolidated Revenue Fund.

Forms of application may be obtained from any branch in Canada of any chartered bank and at the office of any Assistant Receiver General in Canada.

Subscriptions must be for even hundreds of dollars.

In case of partial allotments the surplus deposit will be applied towards payment of the amount due on the October instalment.

Scrip certificates, non-negotiable or payable to bearer in accordance with the choice of the applicant for registered or bearer bonds, will be issued, after allotment, in exchange for the provisional receipts.

When the scrip certificates have been paid in full and payment endorsed thereon by the bank receiving the money, they may be exchanged for bonds, when prepared, with coupons attached, payable to bearer or registered as to principal, or for fully registered bonds, when prepared, without coupons, in accordance with the application.

Delivery of scrip certificates and of bonds will be made through the chartered banks.

The issue will be exempt from taxes—including any income tax—imposed in pursuance of legislation enacted by the Parliament of Canada.

The bonds with coupons will be issued in denominations of $100, $500, $1,000. Fully registered bonds without coupons will be issued in denominations of $1,000, $5,000 or any authorized multiple of $5,000.

The bonds will be paid at maturity at par at the office of the Minister of Finance and Receiver General at Ottawa, or at the office of the Assistant Receiver General at Halifax, St. John, Charlottetown, Montreal, Toronto, Winnipeg, Regina, Calgary, or Victoria.

The interest on the fully registered bonds will be paid by cheque, which will be remitted by post. Interest on bonds with coupons will be paid on surrender of coupons. Both cheques and coupons will be payable free of exchange at any branch in Canada of any chartered bank.

Subject to the payment of twenty-five cents for each new bond issued, holders of fully registered bonds without coupons will have the right to convert into bonds of the denomination of $1,000 with coupons, and holders of bonds with coupons will have the right to convert into fully registered bonds of authorized denominations without coupons at any time on application to the Minister of Finance.

The books of the loan will be kept at the Department of Finance, Ottawa.

Application will be made in due course for the listing of the issue on the Montreal and Toronto Stock Exchanges.

Recognized bond and stock brokers will be allowed a commission of one-quarter of one per cent. on allotments made in respect of applications bearing their stamp, provided, however, that no commission will be allowed in respect of the amount of any allotment paid for by the surrender of bonds issued under the War Loan prospectus of 22nd November, 1915. No commission will be allowed in respect of applications on forms which have not been printed by the King's Printer.

Subscription Lists will close on or before 23rd September, 1916.

Department of Finance, Ottawa, September 12th, 1916.

"ASBESTOL"

Meets the Lumberman's Every Requirement

The Lumberman above all Glove wearers requires a glove that will stand the roughest kind of wear, also a glove that will resist rain, slush and long exposure.

ASBESTOL
REG. IN U.S PAT OFF.

EISENDRATH'S CELEBRATED HORSE HIDE

GLOVES and MITTENS

have been endorsed by thousands of Lumbermen to stand each and every one of these severe tests. What's more,—"ASBESTOL" can be washed with warm water and soap and will dry out soft and pliable.

Dealers!—Your jobber will supply you with "ASBESTOL" Gloves and Mittens. Ask him to send you Catalogue showing "ASBESTOL" in many different styles.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

Men Minutes Money

The man who "wouldn't spend a cent" on an International Time Recorder discovered one day that he was paying for one because he didn't have it. When he did really install one it paid for itself.

HOW ABOUT YOU?

These are the Three Great Factors in Commercial Life—the International Time Recorder is their Watch Dog.

Just like your lumber and hardware, minutes cost you money. They represent your greatest investment and yet they are the one raw material that is not carefully and accurately measured.

Meter your time with an International Time Recorder. Get all the time you pay for—cut the Gordion knot in preparing your time sheet—promote co-operation and discipline and avoid disputes,

There are 260 styles of International Time Recorders—one is particularly suited to your business. Prices from $100.00 up.

Complete details on request.

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of

REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

Sanitary Steel Bunks

Double Deck Bunk No. 171

Black Japan Finish. 1½ inch angle-iron frame supported by strong steel braces. "Alaska" patent twisted link fabric attached to frame by oil-tempered helicals at each end, making very strong, resilient and comfortable bed. Height of ends, 60 inches; height of lower spring, 13 inches; height of upper spring, 52 inches; length, 76 inches. Sizes: 4-6, 4-0, 3-6, 3-0, 2-6. Shipping weight, 145 pounds.

Good sound sleep for your men will repay you many times over in increased vigor and work.

No chance for vermin in these steel frames. Can be erected or taken down in a few minutes. Packed flat for shipping. ***Last a lifetime.*** We guarantee every bed for 20 years. They are strong and much more comfortable than wooden bunks.

Mattress is strong, durable, light—filled with clean, curled wood fibre.

Special prices for lumbermen. Write us for further information.

If All Saw Gumming Wheels Were Aloxite Wheels

THERE would be better gummed saws—no case hardening, no drawing of the temper—just clean, fast, cool cutting without drag; without unnecessary heat. Aloxite Saw Gumming Wheels hold their shape and they show long life.

The proof of all this is in a trial wheel

Next Time You Buy Harness

Good harness costs money. Ask the dealer next time what the special points are about his harness. If he offers you **Alligator Brand** he will show you the excellent leather used, then the tough tannage, which makes it practically impervious to weather and wear. Another point you notice is the excellent quality of the hardware used. **Alligator Brand** Lumber Harness is made for the lumber business and it's made well.

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

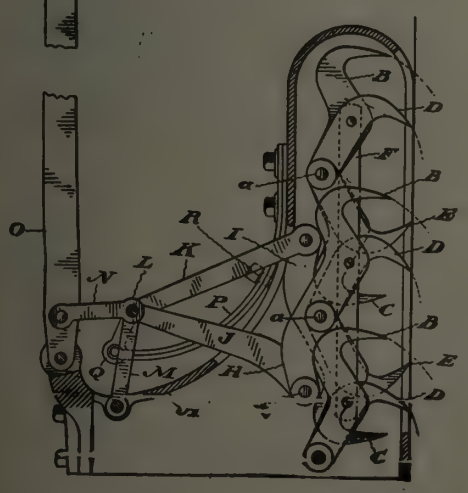
A Boon to Lumbermen

Payette's Famous Patent Mill Dogs

650 Sets already sold

Fig. 1.



BECAUSE

(1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves, Five different classes and styles of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

The Scientific LACEY REPORT vs. The Ancient "Timber Cruise"

Modern scientific methods have invaded the lumber world in a dozen ways, and it is no mere commercial exaggeration to say that in their special field—the estimating, buying and selling of standing timber—James D. Lacey & Company have been and are the foremost factor in the introduction of scientific methods. This company, single handed and alone, has rendered the ancient (if not venerable) "timber cruise" an obsolete institution in the eyes of careful lumbermen and buyers and sellers of timber.

A LACEY REPORT on a tract is nowadays considered by ALL who have really investigated them to be the only really certain measure of timber values.

Wise people, when in the market to sell or buy, consult us first. We are constantly in touch with the whole field.

We can convince you.

Send for booklet of "Pointers."

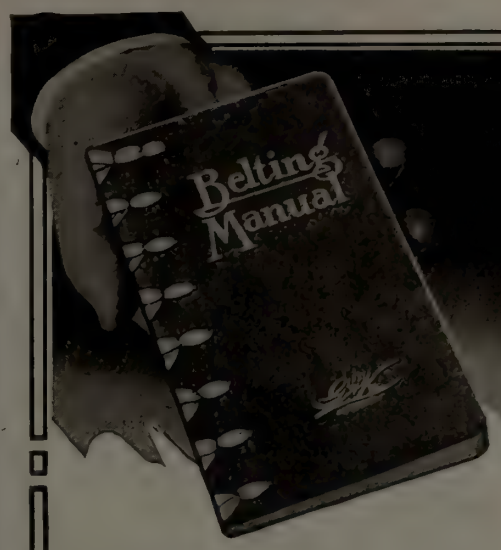
CANADIAN LINK-BELT CO., LIMITED

1189 KING STREET WEST - TORONTO

A. R. Williams Machinery Company, Limited, Vancouver, B. C.



This Valuable Book sent all Belt Users for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

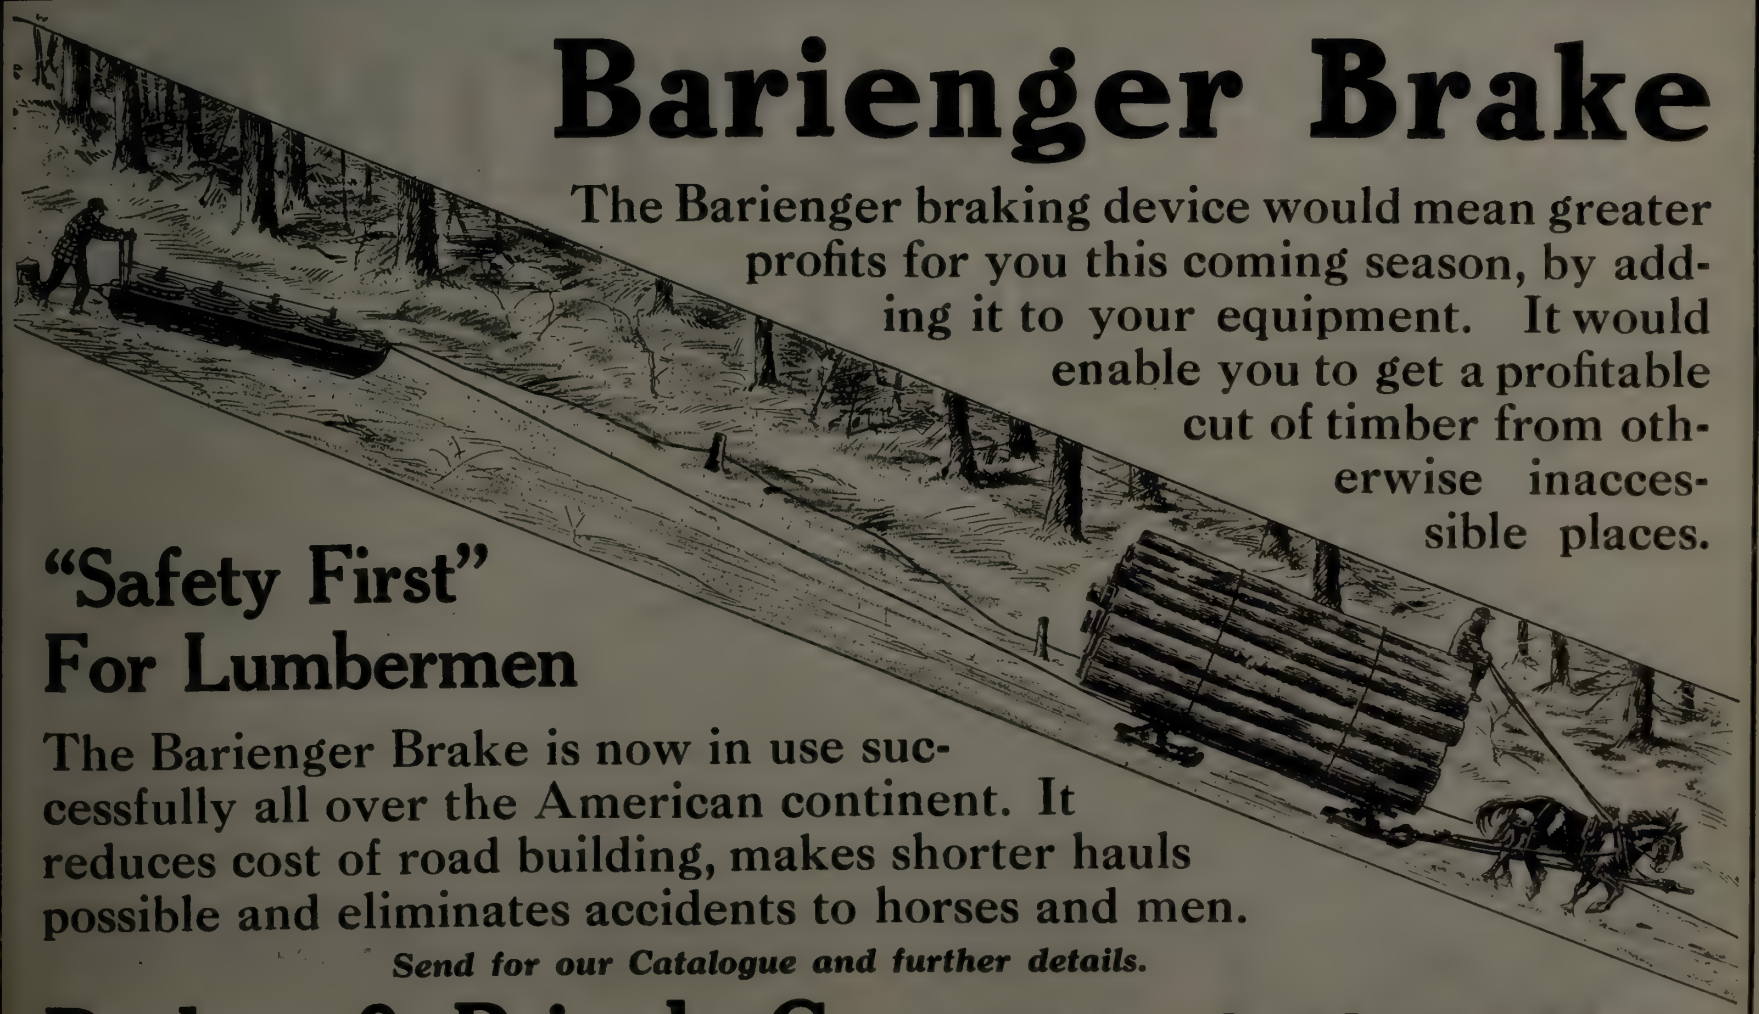
Barienger Brake



The Barienger braking device would mean greater profits for you this coming season, by adding it to your equipment. It would enable you to get a profitable cut of timber from otherwise inaccessible places.

"Safety First" For Lumbermen

The Barienger Brake is now in use successfully all over the American continent. It reduces cost of road building, makes shorter hauls possible and eliminates accidents to horses and men.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts is avoided. Interchangeable parts kept on hand at our Works for prompt shipment.

Lath Machine and Bolter

This machine is a combination of our No. 2 Bolter and No. 2 Lath Machine mounted in a single frame. The lath machine is made the opposite hand to our shingle machine. The illustration shows the bolter side of the combination. In mills where the floor space is limited and the output must be large this machine is an ideal combination. The details of construction found in our No. 2 Lath Mill and No. 2 Bolter apply to the combined machine.

When you overhaul your mill get in touch with us about new equipment.

And Here is Why:

Built in 8, 9 and 10 ft. sizes, there's a Waterous Bandmill for every kind of work.

The spring-cushioned, all knife edged tension device is the most sensitive in use.

Upper and lower guides swing about the exact centre of the saw blade.

The Upper Guide is raised and lowered by steam, and easy, accurate and swift adjustment unequalled by any other.

Wheel raising device and tilting device are roller bearing. Operating mechanism is entirely enclosed in columns. Sawdust and slivers cannot reach it.

Massive design of the bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

Every part of the mill is designed to make mill-wrighting easy. Adjustments and inspections can be made without difficulty.

Waterous Bandmills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than 50 years. It counts.

The Waterous Engine Works Co., Limited

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. **Price 30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

Can You Answer

When a customer asks for advice on painting and finishing?

It is to help you answer such questions authoritatively whenever the query relates to

Arkansas Soft Pine

that we recently arranged a test on painting and finishing twenty-five specimens of Arkansas Soft Pine by the Institute of Industrial Research at Washington, D.C., under the personal supervision of Henry A. Gardner, Assistant Director.

These experiments are now completed, and the results have been compiled by Mr. Gardner into a set of directions for painting and finishing our product. We have put them in pamphlet form, and will be glad to send you a copy, Mr. Dealer.

These same directions are also being incorporated into a more elaborate book on painting and finishing, which will be ready for distribution to home-builders a little later on. Every person receiving the book will, of course, be advised that Arkansas Soft Pine is sold only through local dealers.

Just another instance of how we help you sell Trade Marked Arkansas Soft Pine—by studying our product, by educating the public to its use through national advertising, by standing behind the product with an identifying trade mark, and by referring direct inquiry to local dealers.

There is a distinct merchandising advantage to you in selling a specific wood for a specific purpose, rather than mere "lumber." Arkansas Soft Pine is nationally known as "The Satin-like Interior Trim."

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

On What Shall We Quote:

Arkansas Lumber Company, Warren, Ark.
Cotton Belt Lumber Company, Bearden, Ark.
Crossett Lumber Company, Crossett, Ark.
Eagle Lumber Company, Eagle Mills, Ark.
Edgar Lumber Company, Wesson, Ark.

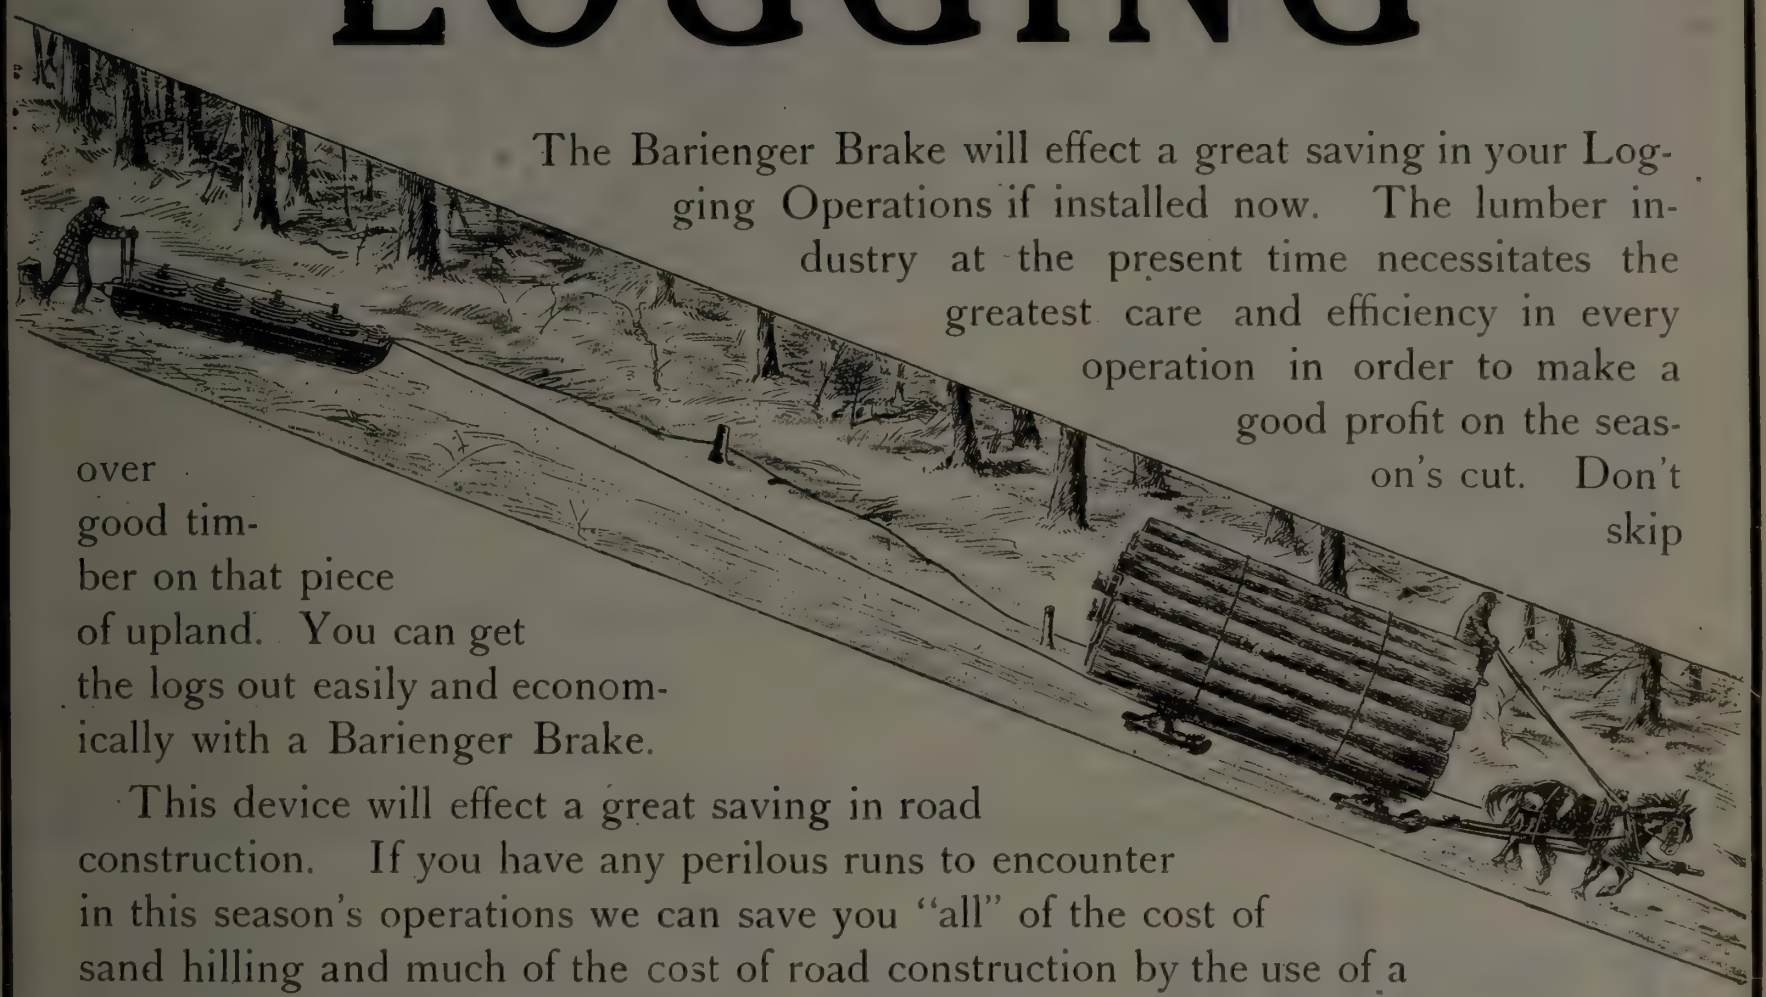
FOR UPLAND LOGGING



The Barienger Brake will effect a great saving in your Logging Operations if installed now. The lumber industry at the present time necessitates the greatest care and efficiency in every operation in order to make a good profit on the season's cut. Don't skip over good timber on that piece of upland. You can get the logs out easily and economically with a Barienger Brake.

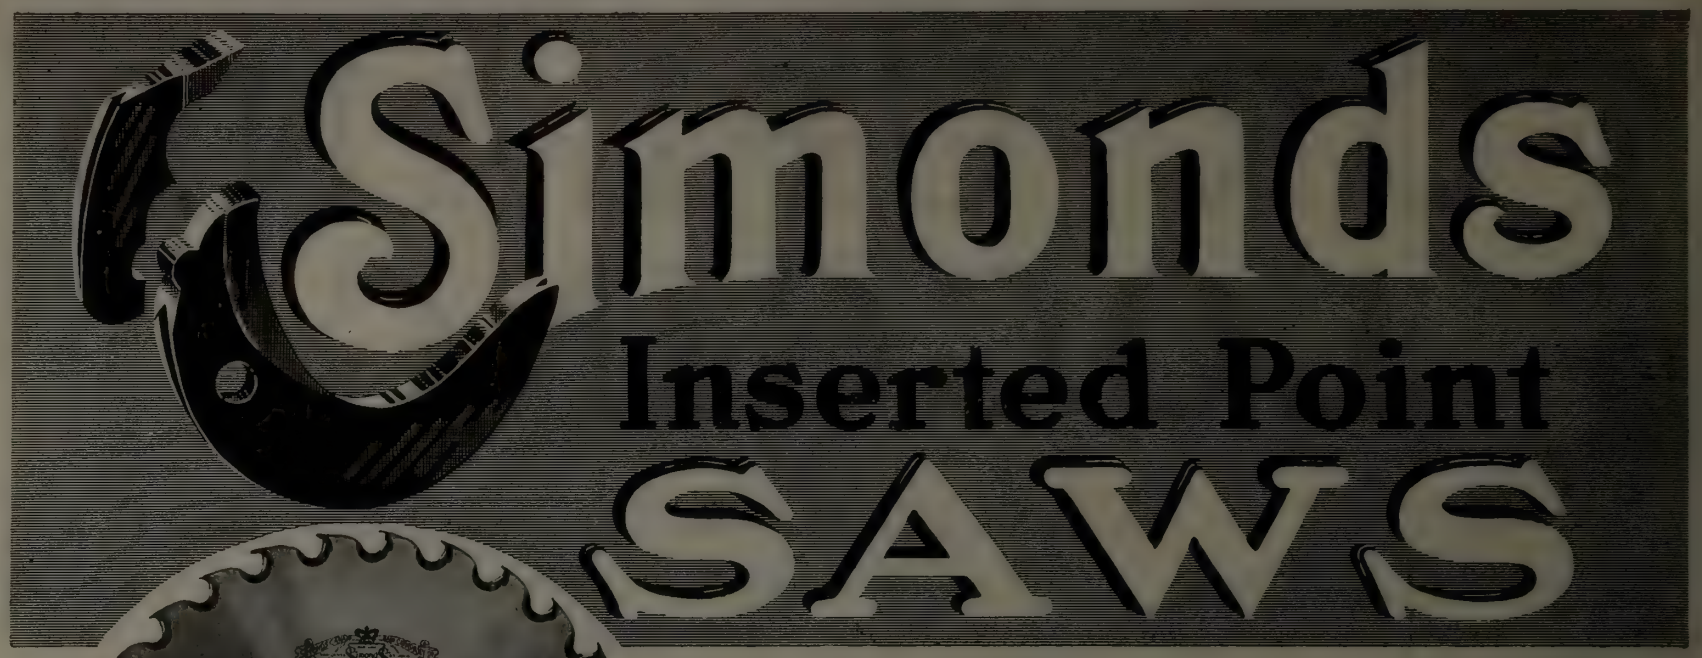
This device will effect a great saving in road construction. If you have any perilous runs to encounter in this season's operations we can save you "all" of the cost of sand hilling and much of the cost of road construction by the use of a Barienger Brake.

Barienger Brake

The Barienger Brake has been in practical use for many seasons in all parts of the country. It means safety for human life, horses and lumber. It will shorten your hauls and will effect an almost unbelievable saving in many ways. Write for descriptive booklet and full particulars of this Braking Device. We will put your name on our mailing list for photographs and details of any special interest in connection with Barienger Brakes.

RYTHER & PRINGLE CO.

Carthage, N. Y.



You can now secure practically any standard style of changeable tooth in the Simonds Saw plate. We furnish tooth styles known as B, D, F, K, 2, 2½, 3, 4, 5, or I X L in Simonds Inserted Point Saws. The superiority of these saws is demonstrated by their use. Simonds Saws stand up better and give universal satisfaction. Write us for more facts about them. Specify the sizes you want and let us quote prices. Send for 1916 catalogue.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.
Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, October 1, 1916 No. 19

What is the Matter with Our Retailers?

The formation of a National Retail Lumbermen's Association in the United States is reported as having taken place recently at a meeting held in Chicago. This step is probably one of the most important that has been taken in connection with the lumber trade organization movement for many years, as it will, to a considerable extent, complete the circle of organization throughout the trade, which now has its National Manufacturers' Association, its National Wholesalers' Association, and its National Retailers' Association, as well as a large number of more restricted organizations handling the interests of particular sections of the trade and industry. These organizations, by co-operating in many of their efforts, are doing an incalculable good to the whole lumber business.

Why is it that in Canada we have so much difficulty in bringing about anything similar in the way of co-operation? With one or two notable exceptions, the history of lumber trade organization in Canada has been disappointing. Sometimes we are likely to think that the natural disposition of the people in the United States is more favorable to this sort of thing than it is in Canada, and probably there is some truth in this idea, but there is surely not sufficient in it to account for the failure of Canadians to co-operate when one considers the importance of the work and the benefits which it can produce.

We have in Western Canada a splendid association of retail lumbermen, which is making greater progress perhaps than any similar organization either in Canada or the United States. Outside of this, however, there are only one or two small local retail organizations whose influence is confined to a very small area. There is no reason why a number of good retail lumbermen's associations should not be in existence in Canada to-day, which would provide a nucleus for the formation of a national association similar to that which has been formed in the United States.

Such organizations would find a great deal of work to do that would produce good results from the very first. One of the chief purposes for which retail associations are formed is to show manufacturers and wholesalers the wisdom of selling to the retailer only and not seeking the trade of the consumer in the same territory as their retail customers cover. This is really a fundamental principle in the proper conduct of any line of retail business, and the organizations of retail associations have always been able to bring about good results along this line. In the United States, however, the activity of the retail associations has gone far beyond this, and the new organization of the retailers from all parts of the country gives an indication of the width of its scope by its first official acts.

The National Wholesale Association of Retail Lumbermen, immediately after its formal organization, went on record in favor of the trade-marking of all lumber products, to show in what mill they were produced, and the marking of the grade to ensure the consumer that he is obtaining the particular line and grade of lumber he calls for. In the past some retailers have made quite a good thing from time to time out of regrading their stocks, a practice which brought a good profit for the time being, but which destroyed the confidence of the consumer.

If the retailers insist upon manufacturers and wholesalers furnishing them with trade-marked and grade-stamped lumber, the manufacturers and wholesalers will have to give it to them. The first step in the direction of such a reform has already been taken by many of the large manufacturers and associations of manufacturers in the United States, so that the outlook for putting this particular reform into effect is very favorable.

The new National Association of Retail Lumbermen will also co-operate with the manufacturers in the exploitation of wood for those uses for which it is best suited. This will dovetail nicely with the campaign of the National Lumber Manufacturers' Association for advertising wood in a national way. In fact, the new organization finds upon its very inception that much of its field of work is already mapped out for it by the other large organizations, and that its appearance in the field is the logical completion of a movement which has the interests of all sections of the industry and trade at heart.

Retail lumbermen in Eastern Canada have dragged far behind in this field. While the United States' retailers have already formed local and national organizations, we can scarcely say that the retail association movement in Eastern Canada has been born. Either the Canadian retailer is neglecting a good thing or the movement is of no use. In the face of the results secured, both in the United States and Western Canada, it is not possible to assert that the movement is anything but a good one, and we are forced to the conclusion that Eastern Canadian retailers are neglecting their own interests by not organizing both local and national associations.

Lumber Prices will be Higher

If there is one fact that stands out more clearly than any other in connection with the lumber trade in Canada to-day it is the universally held opinion of manufacturers and wholesalers that lumber is going to be dearer before it is any cheaper. Our discussions with members of the trade of late have converted us very definitely to this point of view. This is not said without a great deal of study or without securing the views of a large number of men who are intimately connected with the industry and the trade in their various branches. It is not simply an opinion set forth by way of a prophesy, nor is it the expression of a wish that is father to the thought. It is based upon a conviction that has been steadily growing and that was carried to a practical demonstration by the opinions we were able to publish in the Annual Camp Number of the Canada Lumberman on September 1st. We felt pretty sure of the soundness of these views when that issue was published, but we waited a few weeks longer before declaring ourselves very definitely, in order to discuss the subject in still further detail with other lumbermen.

While our object in publishing the Camp Number was to place before readers as interesting and vivid an idea as we could of the logging end of the industry as it is carried on to-day, we found, before we had proceeded far with its preparation, that it was developing into an almost continued story of rising costs, increasing manufacturing difficulties, and rapidly diminishing supply of labor. While we have

dwelt upon these points to some extent in previous issues, we feel that the situation calls for keeping them continually before the lumbermen of Canada to-day.

For more than two years the disturbing and depressing effects of the war have been at work upon the lumber business. Building operations have been practically nil in Canada during that time. All industry has been going through a process of reorganization. We have had to face conditions for which we had nothing in all our past experiences that would serve us as a guide. The demand of many of the largest wood-consuming industries has fallen almost to zero. Others, it is true, have developed, and have done much to help in lessening the shock. Nevertheless, we have had two years, during which by far the greatest proportion of business developments have been such as to depress the lumber trade. It may be assumed quite reasonably that during that time we have passed through the worst of our troubles. There is no question that with such conditions as have prevailed the price of lumber may be assumed to have touched bottom. Even if the present conditions of scarcity of available stocks, increased cost of production, and possible improvement in the demand were absent, it would be reasonable to assume that lumber would not be any cheaper than it has been of late.

It is chiefly when we consider the present manufacturing situation that we are obliged to take the view that higher prices are assured. It would not be of any use to repeat a description of present trade conditions. We have already gone into them pretty thoroughly, and manufacturers and wholesalers are well acquainted with the details. Retailers, perhaps, in some cases have not yet seen the writing on the wall, but before next spring we will be greatly surprised if they are not also well acquainted with the peculiar situation that we believe can be counted upon to produce higher costing lumber, even though the demand should be only light.

To tell the truth, we do not at present see much that looks like an increased demand in the immediate future, but in these days, when the war situation is changing almost hourly and growing continually more favorable to the allies, one would be foolish to leave out of consideration the likelihood of peace being suddenly thrust on us almost without warning. With a return of peace, although we will have a period of disturbed industrial conditions to face, the lumber industry will be one of the first to recover, because of the fact that lumber is so universally useful as a reconstruction material and also as a raw material for many of the industries that will be stirred into activity by the return of mankind to the ways of peace.

Price Cutting Quite Unjustifiable To-Day

The man who fails to keep a stiff backbone nowadays, and who decides that he must get rid of some of his lumber in order to get his hands upon a little more money than has been coming his way, is doing himself and other lumbermen a great injury. Price-cutting is a very enticing proposition. We are all prone to believe in its efficacy, in exceptional cases at least. The great expansion of the departmental store business and of many other lines of business conducted on rather similar grounds has led the average man to believe that lower prices create demand, and to try to put this theory into practice without considering whether it is infallible and universally true. If one looks into the matter critically he will quickly learn that price-cutting creates a demand all right in certain well-defined cases, but that in others, which are equally well defined, all the price-cutting in the world will not create an atom of demand, but will, by unsettling the mind of the buyer, have the opposite effect, and make him wait for still further concessions. This is the case with lumber. The demand for lumber in Canada to-day is such that it would scarcely be possible to make the market take a single extra stick, even if one gave his stock away. The conditions do not exist which permit of the consumption of lumber stocks in normal quantities.

Price-cutting really is not so great a trouble in Canada to-day as it sometimes is, because the supply of lumber is not large, and those who have it have had a long time in which to become familiar with trade conditions such as they are at present. There are some, however, who are indulging in this practice, and we suppose that there will always be more or less of them. So far as the retailer is concerned, he should be getting full value to-day for everything that he moves out of his yard, for he will probably not be able to replace it at its former cost. One hears in many quarters to-day that the trade is not one in which price plays an important part, but that delivery is the main factor. This, of course, is largely from the wholesalers' and the manufacturers' point of view, but it must have its effect upon the retailer, and we believe that the retailer in Canada to-day ought to be trimming his sails for possible price squalls. The conditions are all pointing that way, and it will not need much in the way of a reduced output in the woods during the coming winter to stiffen up prices all around next year.

Therefore, we feel warranted in advising the price-cutter to mend his ways, for he is giving good lumber away. We also believe that we are well advised in telling the retailer and the man who uses lumber as a raw material that they may make up their minds now that any stock they buy to-day will be worth more than they are paying for it before many months have past.

If these views are well founded—and they are the views that we find practically every lumber manufacturer and wholesaler expressing to-day—would it not be a good thing for those who call upon the retailer and the consuming trade generally to act upon them uniformly? That is to say, why should not the man on the road and all those who have to do with the selling of lumber stocks make this their chief line of talk from now on? Once the lumber-buying fraternity in general are shown the actual state of affairs in existence to-day the big obstacle will have been removed. Unquestionably there are large amounts of money standing idle in the banks which are ear-marked for the purchase of lumber when the owners become convinced that no further price reductions can be obtained. The situation is exactly ripe for bringing out much of this money, and salesmen who continually talk this situation up to their customers will be helping to bring about all the sooner the return of a fairly active market.

Educating the Consumer—A Word from Great Britain

Not very long ago we had the pleasure of publishing in these columns some extracts from a letter written by Mr. Ernest W. Tickle, a well-known English hardwood merchant, to the chairman of the Lumbermen's Round Table at the International Convention of Rotary, at Cincinnati, O. Mr. Tickle's chief point was to call attention to the good times that are coming to the lumber trade after the war, and to urge lumbermen to get ready for them. The publicity given to his letter leads Mr. Tickle once more into print, this time in the columns of "The Timber Trades Journal," of London, Eng., and what he has to say makes one think that he has been infected by the enthusiasm germ that flourishes so vigorously at conventions of lumbermen in the United States. At any rate, his remarks are refreshingly pertinent, and, while they apply definitely to the trade in Great Britain, there is scarcely one of his points that cannot be applied equally well to the lumber trade in Canada.

"For many months past the thought has kept riñging in my mind," Mr. Tickle writes, "are we hardwood men doing all that we can to extend our trade Are we even going the right way to hold what little position hardwoods have on the British market? Or, are we not letting manufacturers of substitutive commodities oust us without so much as a murmur of protest, let alone a full voiced chorus of organized defiance or a single tactical stroke in opposition?

"Let us first of all consider one or two of the lines where we have let, or are letting, the steel trade appropriate our markets, firstly, in office appliances. Have your readers noticed the pertinacity with which so-called office system experts have been drilling their salesmen and, through their salesmen, the consumer, with the idea of the greater fire-resisting quality of a filing cabinet, or a stack of card

index drawers, made from steel, than of similar goods of oak, mahogany, or walnut—a point which, to say the least, is, at any rate, open to debate? Have they noticed the insidious advent of the steel carriage upon the railways of our country, and yet not a word of protest against this innovation, or in defence of the wooden carriages upon which the efficiency of our railways has been built? This invasion of the railway realm of hardwoods in America so enraged the lumber trade over there that publicity was given to the controversy in the public press all over that vast country, with the result that public enquiries were held into the merits of the rival constructions, and, although steel is gaining the supremacy on competitive grounds, the lumberman is still fighting his case on the broader and nobler basis of the safety of human life. Even considered one or two of the simple conveniences of domestic life, enamelled ware draining boards and pastry boards (ever thought of the glorious incongruity of an enamelled iron board), pastry rolling pins of china and glass, every one of these the legitimate field of hardwood? Think of the thousands of miles of galvanized wire now used in fencing, where once it was all wood, soft wood chiefly, of course, but even the soft woods are being ousted in this soulless age of ferro-concrete, by such atrocities as reinforced concrete fencing poles, telegraph poles, and railway sleepers. And yet hardly a single voice, let alone a stupendous roar of anger, and not a single suggestion of organized opposition have I heard.

"Our growing love of 'buying in the cheapest market' has brought these troubles upon us, just as it bred the German menace, which has produced the tragedy of the last two years, and, unless we fight our hardest, each in his own particular trade, peace, with its increased taxation and its aftermath of high-cost living, will batten this curse of 'cheapness' upon us, till we reach a stage of utter and horrible misery.

"But if we fight, and fight hard, for quality and service, this war, with its possibilities of the removal of Continental 'dumpings,' ought to give us our chance of re-establishing the old British reputaion of highest quality goods and workmanship. Don't let peace find the timber trade, and especially the hardwood branch of the trade, at its old policy of 'laissez faire.'

"It is no use merely talking about the existence of such evils in our trade, unless the critic feels he has a suggestion to offer worthy of careful consideration by his fellow-tradesmen, and, whilst I do not claim any degree of originality for the suggestions I want to make, I hope they may interest your subscribers and raise a correspondence in your columns which will result in benefit to our trade.

"Within the last few years business matters are being looked at from a point of view hitherto considered as heterodox, but in the analyzing process through which business thought has been passing it seems as if really fundamental truths are being crystallized, most of them so amazingly simple that you say, "That's nothing new; I knew it long before the days of so-called business science," and these fundamental verities are being grouped as the axioms on which is growing this new school of business thought.

"One of the earliest discoveries of these basis truths was that, no matter how many middlemen may enter into a transaction, **it is the ultimate consumer who keeps the factory going and regulates its policy.**

"Another is that the consumer does not even appreciate the ultimate extent of his requirements, the advance of civilization, with its increased comforts, and, above all, man's growing desire to achieve such comfort along the line of minimum effort is turning his luxuries of to-day into the necessities of to-morrow, and it is advertising this is moulding the lines in which his tastes advance.

"Our great-grandfathers, at the expense of greater physical effort, conducted business without the aid of the telephone, the taxicab, the cable, or the telegram. You accept these necessities of to-day without a thought as to the force that made them possible. What was it? Human necessity, in its desire to conduct its affairs in the least exhausting manner possible, brought about purely by **advertisement.** John Jones had it, and either achieved the same result by such helps with less endeavor or accomplished greater things with the same labor as the men who had not those advantages. That is advertisement in its broadest sense, and every good thing will ultimately come to the front by that line of advertising, as it is an established fact that 'the best advertisement in all the world is the wagging tongue of a satisfied customer.' But how much more quickly can consumption be increased by efficiently organized publicity on right lines and in the right direction!

"You ask, how does this apply to the timber trade? My contention is this: That a worse organized trade, or a trade which has a lower conception of the power of advertising, would be hard to find. And yet what great results are possible if we would only get busy along these lines.

"What has been achieved elsewhere? In America there are many organizations for the furtherance of the interests of a single wood, and in some cases for the development of a single use of a single wood. Walnut, oak, red gum, and many other woods have each their own association, and in regard to the first named, the American Walnut Association has achieved one of the most marvellous results imaginable. Only a very few years ago America was lamenting the fact that American walnut was 'cut out,' and, as some of our statesmen, referring to Russia as a 'spent force,' got a surprise ten months later, so Penrod and his son-in-law, Jurden, of Kansas City, and the Pickrel people of St. Louis, McCowen of Louisville, and a few others got together and formed the A. W. M. A., and to-day, to the confusion of the 'misanthropes,' have placed the 'cut out' in either the third or fourth place of honor in the furniture woods consumption list.

"Take the hardwood goods, which, perhaps, lie closer to my heart than anything else in the hardwood trade—maple flooring. The Maple Flooring Manufacturers' Association is daily advancing from victory to further triumphs by organized publicity, and, in conjunction with them, I might say I am planning in a small way a campaign to try and lighten the darkness of the architects round about my own home city. Let us, especially the younger men in the hardwood trade, who still have our way to make, get together (whether we be broker or wholesaler or retailer, or interior finish manufacturer, or furniture maker, or furniture seller), and see if we cannot form a live organization, working independenty and yet alongside of the existing associations, which are too busy looking after the technicalities of the trade, terms of credit, and such details to consider any extension of their work.

"Let us endeavor to find ways and means of progressive advertising among the ultimately consuming class, and at the same time establish a hardwood information bureau, to which the ignorant consumer may apply for light and leading in his groping for that which he wants, but does not yet know he really does want.

"The new school of thought is directing our attention to the fact that woman is the great deciding factor in the purchasing world, especially in all matters intimately connected with the home. Ought we not, therefore, to seriously consider how best to prove to a woman the immeasurable superiority of a home fitted with hardwood floors, and the added artistic touch to the world in which she rules supreme by the logical use of birch, oak, mahogany, or other hardwoods, treated in a natural and a beautiful manner, for the doors, skirtings, and general interior decoration of her home? 'Cherchez la femme,' but at the same time do not forget the influence of the architect who designs that home, whose suggestions so often are law in such cases, and whose ignorance on the question of the usage of wood in a truly artistic fashion is just as colossal as it is at once sad and amazing. Let us, therefore, go thoroughly into the question of reaching the 'ultimate consumer.' Let us realize that it is only by unified action that results may be accomplished. Let us sink personal interests, the general commonwealth of the hardwood trade will find our own personal pockets the richer, according to the way in which we have managed to maintain our hold on the trade there is to-day, our own personality will decide the share we obtain in the increased sales, but let us forget self a bit and work for the glory of our calling. If we can persuade woman she wants a hardwood home fitted and furnished with the most beautiful of nature's many gems—splendidly figured wood—then the demand will spread from the buyer to the seller and the manufacturer, and will pass through retailer, wholesaler, and broker to the shipper of the wood across the ocean, and ultimately to the owner of the stumpage so many thousands of miles away, and, in passing, will leave a coin or two in the hands of all the intermediary interests, to the benefit of British trade in general and of the hardwood community in particular. By such means I believe we could within a year or two double, if not treble, the consumption of hardwoods in these isles—but it can only be done by concerted force."

British Columbia Timber Returns for July

The timber returns for the month of July, issued under direction of the Minister of Lands of British Columbia, show the total scale of sawlogs for the province to be 140,561,435 feet board measure, in addition to 610,121 lineal feet of poles and piles, and 36,678 cords of shingle bolts, ties, posts, etc.

The sawlogs scaled in the various districts include Vancouver, 99,051,896 ft.; Island, 14,535,055 ft.; Cranbrook, 13,269,894 ft.; Vernon, 3,953,905 ft.; Prince Rupert, 3,371,003 ft.; Nelson, 3,086,346 ft., and Kamloops, 3,069,139 ft.

In the Nelson district 247,555 lineal ft. of poles were scaled; Vancouver, 162,503 lineal ft.; Prince Rupert, 53,786 lineal ft.; Island, 52,909 lineal ft.; Cranbrook, 41,820 lineal ft.; Vernon, 37,538 lineal ft., and Kamloops, 14,010 lineal ft.

Of the shingle bolts, railway ties, posts, etc., there were scaled in the Vancouver district 24,517 cords; Cranbrook, 5,548 cords; Island, 3,911 cords, and Nelson, 2,022 cords.

Provincial timber sales recorded during the month of July cover an estimated total of 14,155,000 feet B.M. sawlogs, 125,000 lineal ft. of poles, and 3,479 cords of shingle bolts, fence posts, and cordwood, to produce an estimated revenue of $18,811.

Oak is the most suitable wood for carving, on account of its durability and toughness, without being too hard. Chestnut, American walnut, mahogany, and teak are also desirable, while for fine work Italian walnut, lime, sycamore, apple, pear, or plum are generally chosen.

Lumber, Lath and Shingle Output, 1915

Production Reduced by One Hundred Million Feet, But Value per Thousand Feet Shows Advance—Lath Output Greater—Shingles Also Increased

The annual report of the production of lumber, lath and shingles in Canada, covering operations during the year 1915, has been prepared by the Forest Branch of the Department of the Interior, Ottawa, and will shortly be published in bulletin form. The report will say, in part, that statistics have been obtained from 3,239 mills operating in Canada during the calendar year 1915. Reports were received from 396 more mills in 1915 than in 1914. This increase was largely due to more complete returns from Quebec and British Columbia, made possible by the co-operation of the provincial forest officials of these provinces.

The total value of the lumber, lath and shingles produced in Canada in 1915 was $69,695,477, the separate items being: lumber, 3,842,676,000 feet, board measure, valued at $61,919,806; lath, 793,226,000, valued at $2,040,819; and shingles, 3,089,470,000, valued at $5,734,852.

Lumber Production—Total cut, 1914 and 1915, by provinces:

*Less than one-tenth of 1 per cent.
†Includes Hickory, Cherry, Walnut and Tulip.

The softwoods formed 94.5 per cent. of the total lumber produced in Canada in 1915, the remaining 5.5 per cent. being hardwoods. There has been practically no change in the relation between the production of these two kinds of woods for the past seven years. Neither has there been a change in the relative position of the four leading kinds of hardwoods in this time.

The four leading kinds of softwoods, with the exception of the year 1913, have retained the same relative position since 1909. In 1913 more Douglas fir was cut than white pine and the latter fell to third place.

Lumber Production by Provinces

The report contains tables showing the production of lumber in the various provinces. In the province of Quebec the production was 1,078,787,000 feet B.M., valued at $17,784,415; this is a slight decrease as compared with the production of 1914. The average value, however, was $16.49 per M feet, as against $15.60 in 1914. The Quebec production showed a considerable increase in the quantity of birch and ash and a slight increase in the quantity of white pine and hemlock, while in the other kinds there was a falling off. The production of the chief kinds was as follows:—Spruce, 599,811,000 feet B.M.; balsam fir, 170,794,000 feet B.M.; white pine, 157,256,000 feet B.M.; birch, 44,980,000 feet B.M.; hemlock, 38,064,000 feet B.M.; red pine, 17,895,000 feet B.M.; Jack pine, 12,006,000 feet B.M.; basswood, 11,890,000 feet B.M.; maple, 6,405,000 feet B.M.; ash, 6,156,000 feet B.M.; cedar, 4,493,000 feet B.M.

In Ontario the production is given as 1,035,341,000 feet B.M., a slight falling off as compared with 1914. The value of the Ontario product was $19,663,950, the average value being $18.99, as compared with $18.89 in 1914. The only important increases in Ontario production were in the cases of white pine and red pine. The white pine production was 623,119,000 feet B.M.; as compared with 488,312,000 feet B.M. in 1914. The red pine production was 102,776,000 feet B.M., as compared with 85,181,000 feet B.M. in 1914. All other kinds showed decreases. The production of the chief kinds of lumber in Ontario was as follows:—White pine, 623,119,000 feet B.M.; hemlock, 107,913,000 feet B.M.; red pine, 102,776,000 feet B.M.; spruce, 84,095,000 feet B.M.; maple, 35,311,000 feet B.M.; elm, 20,266,000 feet B.M.; birch, 15,374,000 feet B.M.; basswood, 12,452,000 feet B.M.; Jackpine, 10,579,000 feet B.M.

In British Columbia the production amounted to 669,816,000 feet B.M., as compared with 936,612,000 feet B.M., in 1914. The average value was $12.56 per M. feet as compared with $11.45 in 1914. Yellow pine and yellow cedar are the only kinds of wood of commercial importance showing an increase in production in 1915 in British Columbia. There was also an increase in the quantity of birch cut. The production of the chief kinds of B. C. woods was as follows:—Douglas fir, 453,415,000 feet B.M.; spruce, 56,360,000 feet B.M.; Western red cedar, 54,666,000 feet B.M.; yellow pine, 35,166,000 feet B.M.; larch, 28,023,000 feet B.M.; hemlock, 24,959,000 feet B.M.; white pine, 7,664,000 feet B.M.

The production in New Brunswick amounted to 633,518,000 feet B.M., as compared with 414,808,000 feet B.M., in 1914, the average value being $15.63, as compared with $15.37 in 1914. There was a considerable increase in the production of spruce, balsam fir, and white pine and in many of the minor species of woods. The production of

hemlock showed a notable decrease. The production of the leading kinds of woods in New Brunswick was as follows:—spruce, 519,699,000 feet B.M.; balsam fir, 45,659,000 feet B.M.; white pine, 35,507,000 feet B.M.; hemlock, 14,922,000 feet B.M.; birch, 8,356,000 feet B.M.; cedar, 5,531,000 feet B.M.; maple, 1,393,000 feet B.M.

In Nova Scotia the production amounted to 294,475,000 feet B.M., as compared with 279,044,000 feet B.M., in 1914, the average value being $14.83, as compared with $14.01 in 1914. The production of the chief kinds of woods was as follows:—spruce, 184,922,000 feet B.M.; hemlock, 52,872,000 feet B.M.; white pine, 25,591,000 feet B.M.; birch, 16,436,000 feet B.M.; balsam fir, 7,091,000 feet B.M.; maple 4,102,000 feet B.M.; Beech, 1,570,000 feet B.M.; red pine 1,101,000 feet B.M. In spite of the falling off in the cut of the majority of species in Nova Scotia, the increased quantity of spruce, white pine, Jackpine and maple was sufficient to increase the total production for the province 5.5 per cent. over 1914.

The production in Saskatchewan amounted to 62,854,000 feet B.M., as compared with 56,677,000 feet B.M., in 1914, the average value being $14.00 per thousand feet, as compared with $14.87 in 1914. The chief kind produced in Saskatchewan was spruce, the amount being 61,970,000 feet B.M., as compared with 55,682,000 feet B.M., in 1914.

In Manitoba the output was 42,357,000 feet B.M., as compared with 44,658,000 feet B.M., in 1914, the average value being $12.97 per M. feet, as compared with $13.47 in 1914. The production of the principal kinds of wood in Manitoba was as follows:—spruce, 39,386,000 feet B.M.; tamarac, 1,584,000 feet B.M.

In Alberta the output amounted to 17,975,000 feet B.M., as compared with 45,236,000 feet B.M., in 1914, the average value being $13.60 per M. feet, as compared with $14.35 in 1914. The production of the chief kinds of wood in Alberta was as follows:—Spruce 13,991,000 feet B.M.; Jackpine, 3,099,000 feet B.M.

In Prince Edward Island the output amounted to 7,543,000 feet B.M., as compared with 6,790,000 feet B.M., in 1914, the average value being $15.19 per M. feet, as compared with $14.42 in 1914. The production of the chief kinds of wood in Prince Edward Island was as follows:—Spruce, 3,879,000 feet B.M.; balsam fir, 2,340,000 feet B.M.

Output of Four Leading Species

The following tables show the production of spruce, white pine, Douglas fir and hemlock in Canada during 1915 and 1914 by provinces.

SPRUCE LUMBER, 1914 AND 1915, BY PROVINCES

The wood of the different species of spruce is very similar. The white spruce is the most important commercial tree in Canada, heading the list in the production of both lumber and pulpwood. The wood is used extensively for cooperage, mine-props, ties, poles, posts and rails, and is also favored for masts and spars of vessels and the manufacture of aeroplanes. Owing to its wide distribution and abundance of the tree its lumber is gradually taking the place of pine for which it is a good substitute. The red spruce is used as lumber much in the same way as white spruce. It is sometimes preferred to the other spruces for interior finish. The more durable wood of the black spruce makes it most valued for mining timber and ties, but in the lumber market it is not ordinarily separated from the other spruces. The Sitka spruce being obtainable in greater dimensions, clear of defects, than any of the other spruces is valued for structural purposes and for masts and spars of large vessels. It is also in considerable demand for organ pipes and sounding boards for musical instruments. Generally speaking, its uses are similar to those of the other species.

WHITE PINE LUMBER, 1914 and 1915, BY PROVINCES

Province	No. of Active Mills Reporting.	Quantity 1914	Quantity 1915	Per Cent Distribution 1915	Total Value 1915	Average Value Per M Ft. B.M. 1914	Average Value Per M Ft. B.M. 1915

DOUGLAS FIR LUMBER, 1914 AND 1915, BY PROVINCES

Province	No. of Active Mills Reporting.	Quantity 1914	Quantity 1915	Per Cent Distribution 1915	Total Value 1915	Average Value Per M Ft. B.M. 1914	Average Value Per M Ft. B.M. 1915
		M Ft. B.M.	M Ft. B.M.				
Total	**131**	**601,643**	**453,534**	**100 0**	**$5,333,573**	**$11 32**	**$11 76**
British Columbia	129	601,412	453,415	100.0	5,332,108	11 32	11 76
Alberta	2	231	119	*	1,465	14 50	12 34

*Less than one-tenth of 1 per cent.

The Douglas fir is also called Douglas pine or spruce, Oregon pine or spruce and red or yellow fir. With the exception of the eastern white pine, and possibly the white spruce, there is no one species which produces more lumber annually in Canada than does this tree. The wood is largely used for building purposes. Its striking grain is making it increasingly popular for interior finish, flooring, panelling and doors. It is gradually replacing the southern hard pine in the markets of eastern Canada.

HEMLOCK LUMBER, 1914 AND 1915, BY PROVINCES

Province	No. of Mills Active Reporting.	Quantity 1914	Quantity 1915	Per Cent Distribution 1915	Total Value 1915	Average Value Per M Ft. B.M. 1914	Average Value Per M Ft. B.M. 1915

Quebec	356	31,323	38,064	15.9	529,473	14 00	13 91
British Columbia	45	31,116	24,959	10.4	285,637	11 01	11 44
New Brunswick	104	26,189	14,922	6.3	192,965	12 38	12 93
Prince Edward Island	26	465	262	0.1	4,038	11 96	15 41

The wood of the eastern hemlock is used largely for rough construction, frames of buildings, boxes, crates, ties and poles. Occasionally it is used for pulp manufacture.

The wood of the western hemlock is much superior to that of the eastern species. It is sometimes sold under the name of Alaska pine to overcome the prejudice against the wood caused by the objectionable qualities of the eastern species. It is largely used in the manufacture of boxes and pulp in British Columbia.

Lath Output During 1915

The production of lath in 1915 amounted to 793,226,000, as compared with 625,010,000 during 1914, the average value per thousand being $2.57 as compared with $2.54 in 1914. The total value of the lath production was $2,040,819. Ontario led the other provinces with a production of 309,022,000 pieces. New Brunswick came second, with 288,951,000 pieces, and the production of the other provinces was far below these two. Spruce was the leading kind of wood from which lath were manufactured, the production being 320,412,000 pieces. White pine came second, with 245,390,000 pieces, and cedar third, with 105,254,000 pieces. The increase in the production of lath in Canada during 1915, as compared with 1914, was 26.8 per cent., as compared with a decrease of 15.1 per cent. in 1914 as compared with 1913. During the past six years there has been a steady increase in the average mill value per thousand of lath manufactured in Canada. In 1910 the average value per thousand was $2.28 and in 1915 $2.57.

Shingle Production in 1915

The output of shingles in Canada during 1915 amounted to 3,089,470,000 pieces, as compared with 1,843,554,000 pieces in 1914, the average value being $1.86 per thousand, as compared with $2 in 1914. The total value of the shingle production in 1915 was $5,734,852. British Columbia led in the production, her total being 1,894,642,000 pieces, as compared with 1,060,272,000 pieces during 1914. The production of the other chief shingle producing provinces was as follows:—Quebec, 574,797,000 pieces; New Brunswick, 458,987,000 pieces; Ontario, 93,497,000 pieces; Nova Scotia, 30,733,000 pieces.

The chief wood used for the production of shingles was cedar, the total being 2,795,441,000 pieces, as compared with 1,777,689,000 pieces in 1914. The average value per thousand of cedar shingles was $1.83, as compared with $2.01 in 1914. The other principal woods used for shingle production showed the following totals:—Spruce, 210,583,000 pieces; white pine, 41,021,000 pieces; Jackpine, 19,544,000 pieces; balsam fir, 15,444,000 pieces. All provinces of Canada, with the exception of Ontario, showed an increased shingle output during 1915. British Columbia produced considerably more than half the shingles made in Canada.

The Department of Lands, Forests and Mines for the Province of Ontario have issued a striking office calendar covering twelve months from July 1st, 1916, to July 1st, 1917. The calendar is attached to a striking poster entitled "The Call of the North," and is designed to attract settlers to the twenty million acres of fine agricultural lands in northern Ontario. Full particulars about these lands may be had by writing to H. A. Macdonell, Director of Colonization, Parliament Buildings, Toronto.

Retailers Complain of Division Court Costs

At a meeting of retail merchants in Ottawa on September 18th, Mr. H. Chevrier, a prominent retailer of Winnipeg, delivered an address upon the Ontario Division Court Act, drawing attention to the expense entailed in collecting small debts under the Act. A resolution was passed, to be presented to the executive of the Ontario Board of the Association, calling upon them to take such steps as may be necessary to have introduced into, and passed by, the Ontario Legislature, an Act simplifying the collection of small debts for the following reasons:

"1st. Because this act will enable us to collect accounts which are to-day considered too small to place in the hands of a solicitor.

"2nd. Because it will relieve us from the exploitation of so-called 'commercial adjusters' or 'collection agency companies,' and it will enable us to do our own collecting inexpensively and expeditiously.

"3rd. Because it will act as a deterent to professional solicitors for credit, who so often solicit without any intention of paying, as they count on the fact that the account being small they cannot be made to pay it."

Mr. Chevrier described the simplicity and effectiveness of the act in vogue in Manitoba for the collection of small debts, whereby the cost of collecting a $5 debt would be but 50 cents, compared with from $6 to $7 in Ontario. A magistrate was appointed in each necessary district to receive complaints of merchants and to issue summonses. The merchant could use his own employees as process servers, thus saving a cost necessary in Ontario. In 95 per cent. of the cases in Manitoba, before the summons became returnable, the debts were settled satisfactorily out of court.

Reports Good Prospects for Canadian Trade in France

Mr. Frank Pauze, of U. Pauze & Fils, Montreal, has returned to Canada with the other members of the government commission who visited England, France, and Italy for the purpose of promoting trade with Canada. The commision made extensive enquiries as to openings for exports, and also looked into the question of imports, especially those which will displace German and Austrian goods. Mr. Pauze sailed prior to the other members, who joined him in Paris. In addition to being a member of the commission, he represented the Canadian Timber Products Association, on whose behalf he made special investigations as to the opportunities for the sale of Canadian portable houses. Mr. Pauze also, as a member of the commission, directed his efforts to enquiries as to the openings for Canadian lumber, especially in France. "The demand is immense," he says, "but Canadians will, if they want the trade, have to adopt the right means. It is difficult to change trade channels, still I think the opportunity is there if we will only go about it in the proper way. I am of opinion that we have the lumber which will suit the market, even more so than the products of the United States, and I also think that we can compete in price. But the problems of transportation and kindred matters will want careful consideration."

The members of the commission were received everywhere with the utmost cordiality. On all hands they found a desire to increase the trade between Canada and the allied countries, the French people being particularly anxious to promote closer business relations.

The exhibition of portable houses in Paris proved of great value, and attracted wide attention.

Annual Concatenation of Hoo-Hoo

The twenty-fifth annual meeting of the Concatenated Order of Hoo-Hoo was held at Memphis, Tenn., from September 9th to 11th. For the first time in the history of the order, the snark of the universe was re-elected for a second year, in the person of Julius Seidel, of St. Louis, Mo., who has made an enviable record for himself during the past year. Mr. E. D. Tennant, of St. Louis, formerly of Winnipeg, Man., was re-elected secretary-treasurer. The twenty-eighth annual meeting will be held at New York on September 9th, 1917.

Snark Seidel, in his annual address, reviewed the remarkable progress of the order during the past year, and outlined many comprehensive plans for the work of the coming year. His address was full of optimism and confidence in the future progress of the order.

The report of the secretary-manager, Mr. E. D. Tennant, showed receipts of $19,342 during the year and a cash balance on hand of $1,229. During the year there had been 39 concatenations held, at which 338 candidates had been admitted. The statement also showed that 3,900 members had paid their 1916 dues, and 2,739 had paid their 1915 dues.

On Saturday night, September 9th, a concatenation was held, and a class of six kittens was initiated into the mysteries of the order. Subsequently a session on the roof was held, at which 154 old cats were present to enjoy themselves. A number of enjoyable automobile tours were taken during Sunday, September 10th, and the order convened again on Monday, September 11th, when a quantity of routine business was put through.

The report of the nominating committee, which was adopted, resulted in the following being elected to carry on the work of Hoo-Hoo for the ensuing year: Snark of the universe, Julius Seidel, St. Louis, Mo.; senior hoo-hoo, W. P. Lockwood, Seattle, Wash.; junior hoo-hoo, Charles J. Kammer, New York; bojum, Stacy C. Bennett, Chicago, Ill.; scrivenoter, W. Frazier Jones, Jacksonville, Fla.; jabberwock, Harry T. Kendall, Houston, Tex.; custocatian, J. G. Robson, New Westminster, Canada; arcanoper, J. F. Gresley, Omaha, Neb.; gurdon, Robert McArthur, San Francisco, Cal.

Surprising Figures of Ocean Freight Rates

An interesting discussion has been going on in several English newspapers in regard to the heavy ocean freight rates being paid by English importers of all kinds of goods. In the Cardiff Mail of recent date the following letter was published. It will be of considerable interest to Canadian timber exporters:

Sir,—The very suggestive figures contained in your edition of Saturday, and commented upon in your leading article, are by no means confined to the grain market. Probably every other foreign trade is similarly affected. The timber trade is certainly one of these. During the past month my firm at Cardiff has imported several cargoes of wood goods, three of which at least show very remarkable figures, as follows:

Place of shipment.	No. of standards carried.	Actual rate of freight per standard.	Pre war average rate of freight.
1. Canada	613	395/-	37/6
2. Sweden	721	230/-	25/-
3. Archangel	1,419	350/-	25/-

In addition to these inflated rates of freight, very unusual and onerous conditions were exacted as regards the discharge of the cargoes. The actual amounts receivable by the shippers of these wood goods, and also by the shipowners, are as follows:

Place of shipment.	No. of standards carried.	Shippers. receive.	Shopowners receive.
1. Canada	613	£ 2,846	£12,071
2. Sweden	721	8,364	8,290
3. Archangel	1,419	15,030	24,832

It must not be assumed that these heavy rates of freight fall upon the importer, although they materially increase his responsibilities. They are passed on to the consumers, viz., collieries, ironworks, railways, contractors, and timber merchants in various districts. This again means increased cost of production and vastly higher prices, which ultimately affect the whole community.

What can be done to limit these high freights? This is a problem at present unsolved. The shortage of tonnage, the enormous mass of material of all kinds awaiting transport, the needs of our own fleet, the absolute necessity of continued enlargement of our navy at any cost or sacrifice, the blockade of all German tonnage (the second largest mercantile fleet in the world). These are only part of the important factors in this great problem.

We can only hope that in some way the government will be able to reach a satisfactory solution. Hasty and ill-considered action would be fatal. England is dependent upon the world for many commodities. The whole of this freight question bristles with difficulties. It is part of the price that has to be paid for war.

But if our own difficulties are so considerable, they are wonderfully light compared with the difficulties of Germany. We get what we require, although the prices are high. The Central Powers, in their blockaded position, cannot do this, and are suffering thereby enormously, both physically and financially. We may be quite certain that our government is fully alive to all these matters, and will not miss any opportunity of affording necessary relief. I am not without hope that some satisfactory arrangement will be forthcoming so as at least to limit these unheard-of and extortionate charges.

I am, etc.,

J. C. Meggitt.

Canadian Paper Trade in Great Britain

The serious situation that has arisen in connection with the paper supply in Great Britain, says "P. M. G." in the Pall Mall Gazette, is complicated by the fact that Canada has an abundance of pulp and is eager and anxious to obtain facilities for its transport to the market where it is most urgently needed, and to which patriotic Canadians would most readily send it.

At the present moment the great market for Canadian pulp and paper is the United States. While Great Britain is importing pulp and paper from neutral countries Canada is compelled to sell elsewhere.

The Hon. P. Pelletier, Agent-General for Quebec, in the course of an interview with a representative of the Pall Mall Gazette, expressed the opinion that a strong appeal should be made to the government to encourage this trade between Canada and the Mother Country.

"There are," he said, "eighteen pulp mills in the Province of Quebec, but the bulk of the produce of these mills goes to the United States. It is practically the only market they have, although very many of them are very anxious, indeed, to do business with Great Britain.

"Although freights are higher in Great Britain than to the United States, that would not prevent a big development of the trade. It is

the shortage of tonnage that stands in the way. If the government could be induced to release some ships it would encourage the pulp maker in Canada and promote the establishment of a permanent trade, which would be of the greatest possible value in the future."

Within the past few months there has been a comparatively unimportant, but nevertheless extremely significant, incident in connection with the pulp and paper trade of Canada.

In the past the great fruit growing parts of the Empire outside Canada itself have invariably employed a special make of paper for the purpose of packing the fruit. Canada did not produce this particular paper.

The first enquiries came from Australia and South Africa, and the Canadian paper makers were promptly informed from London of this need in other parts of the Empire. Within a short time the demand was met, and there is now every prospect of a hitherto non-existing trade in this paper, which is used in enormous quantities, being built up between Canada and other parts of the Empire.

"There is also another aspect of the question," Mr. Pelletier explained. "If this trade were developed it would encourage the pulp makers of Canada to turn their mills into paper making mills, to the great advantage of Canada. The practice at present is for the American paper mills to get their pulp from Canada. If Canada, in addition to making pulp, converted it into paper, and supplied the Mother Country, the advantage to this country and to Canada would be very great. Such a trade once established would last forever."

The tonnage difficulty is, of course, of the utmost gravity, but among those who are most familiar with the problems involved it is confidently believed that an examination of this aspect of the question—due regard being paid to the future of the industry in Canada and the permanent advantages certain to accrue to Great Britain—by the Board of Trade would result in the liberation of a certain amount of tonnage for the purpose.

Canada is willing to sell, Great Britain is equally willing to buy, and it remains with the government to facilitate as far as the exigencies of war permit the mutually advantageous development.

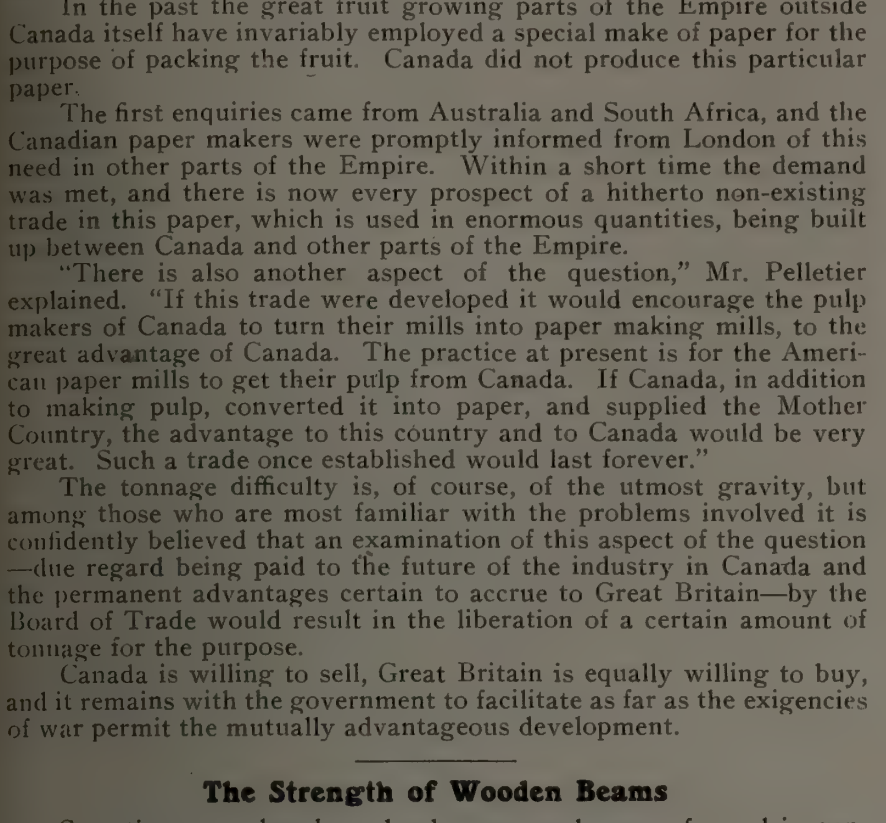
The Strength of Wooden Beams

Sometimes woodworkers, lumbermen, and users of wood in general want to know just how strong a board is, or a beam, whether made of white pine, oak, or other material.

To compute the strength is not always easy, and, anyway, we dislike mathematics very much. It is much easier to use a table or a chart.

I have, therefore, prepared this chart, which will cover any wood and any ordinary board or beam. For example, what is the safe strength of a white oak beam 2 in. wide by 4 in. deep and 5 ft. between supports?

For white oak, 1,000 pounds per square inch is the usual figure (see column B), which makes the problem very simple. For other materials consult column B, or if your beam is made of still different wood, use the corresponding stress per square inch. (See table below.)



Handy Chart for Finding Strength of Wooden Beams

The length, 5 ft., is 60 inches (column A). Run a line through the 60 and the 1,000 (column B), and note the intersection with column C.

Next connect the 2 (column D) with the 4 (column G), and note the intersection with column F.

Lastly, join the intersection (column C) with the intersection (column F), and the answer is found in column E. The beam will hold a little over 700 pounds, UNIFORMLY DISTRIBUTED—that is, the beam will hold a little over 140 pounds on every foot of its length.

After using the chart once or twice you will understand its use thoroughly, and will see how it can be used "backward" as well as forwards. Should you want to find the depth of beam necessary to hold a given load, for example, the depth can be found by reversing the above process somewhat. The process is so simple that I don't think I need explain it. Any lumberman or woodworker can "dope it out" in a short time without difficulty.

Here are the "safe strengths" of the principal woods used in various woodworking industries. The factor of safety used is "ten." That is, the actual breaking strength of specimens in tests was ten times as great as these figures. Of course, the safe strength should always be used, and that is why the larger actual, unsafe strengths are not given:

	lbs. per sq. in.
Ash	1,100
Beech	1,150
Cedar	1,000
Chestnut	1,000
Douglas fir	1,200
Elm	1,300
Hemlock	800
Hickory	1,200
Locust	2,000
Long leaf pine	1,300
Maple	1,000
Norway pine	800
Spruce	900
Tamarack	900
Walnut, black	900
Western hemlock	1,100
White oak	1,000
White pine	900
Yellow pine	1,100

N. G. Near.

Bankers Discuss Lumber Situation

The Canadian Bank of Commerce, which publishes a monthly circular dealing with business conditions throughout the country, has the following to say regarding the lumber situation and the manner in which it is being affected by labor shortage: "In many districts unusual difficulties will have to be faced this fall by the operators of logging camps. Provisions are high in price and men are scarce. Under these circumstances the output of logs all over the Dominion will be less than normal and operating costs will be very much higher. An uncertain factor is the trend of values after the war ceases. Opinion on this point is divided, but the majority of practical lumbermen expect that after the war there will be a steady demand for lumber at good prices. In the meantime it is obvious that the cost of logging during the coming season will cause the output to be very much smaller. In addition present stocks are low and are being steadily drawn upon, and this will tend to prevent any serious collapse of prices."

Newspaper Men Want Export of Pulpwood Stopped

There has recently developed in several parts of Canada a revival of the proposal to prohibit the export of all pulpwood. At present it is only pulpwood cut on Crown lands on which there is an embargo, and this embargo is in each case a provincial measure, adopted by all the provinces which own Crown lands. There are in addition, however, immense areas of land which are owned privately. Pulpwood from these lands can be exported without restriction. From time to time there has been talk of a move towards getting the Federal government to enact a law covering the whole Dominion in regard to the export of pulpwood. This talk has now been put in the form of a direct recommendation by a meeting of the Alberta and Eastern British Columbia Press Association, at a meeting held recently in Calgary.

According to a cable received from London, Sir Edward Morris, Premier of Newfoundland, has stated that some English companies propose to try the experiment of floating pit props across the ocean in rafts, as has been done in the Pacific. Representatives of the companies have sailed for Canada to charter tugs for this purpose.

A System of Accounts for Retailers

Fundamental Principles Clearly Explained—A Valuable Report Upon An All-Important Problem

Under the title of "A System of Accounts for Retail Merchants" a valuable report has been issued by the Federal Trade Commission of the United States. While the report deals with retailers as a general class, the information it contains is indispensable to any retail lumberman, and, with a few modifications to suit particular cases, the system can be adapted to any retail business. The report may be said to lay down the fundamental facts for the successful conduct of retail trade. We have never seen these facts put so clearly and forcefully, and we believe that all our retail readers will be benefited by reading and studying the report, which we reproduce, as follows:

There is a tendency among retail merchants to conduct their businesses without an adequate system for determining their costs. This condition carries with it various undesirable results. In the first place, the merchant is unable to price his goods intelligently and conduct his business upon sound business principles. In the second place, he is unable, when seeking credit, to produce a correct statement of his financial condition which would enable a banker to extend to him the full credit to which he is entitled. He thereby limits the possible expansion of his business.

There are several forces at work which compel the retail merchant, if successful, to keep books, and the better and more comprehensive his methods the greater chance he has of being successful.

The first of these forces is, of course, competition, which at times compels him to make close prices. The second, and one of vital importance, is the attitude of the banks regarding the granting of credit. Banks are paying more and more attention to the accounting methods used by the merchant to whom they extend credit. They are willing to give larger loans and very often more liberal terms to the merchant who keeps his books in a way that enables him to show the bank at any time just how his business is progressing. A merchant who can show progress will undoubtedly receive more consideration with the same amount of assets than one who cannot. Even if he is successful but cannot show it because of his bookkeeping methods the bank will not consider him a desirable credit risk.

Another very important point to which the bank gives consideration is whether the prospective borrower is making proper provisions for depreciation on stock, buildings, and fixtures, and his books should be so arranged as to show the amount of these provisions. No merchant can be said to be managing his business properly unless adequate provision is made for depreciation.

The system of accounts outlined in this bulletin has been devised to meet the requirements of retail merchants. The aim has been to devise the least involved system which will give the information essential to successful management. The best system of accounts for any business is one which furnishes the information required with the least effort.

The value derived from an adequate system of accounts is obvious. The greatest value is that of making comparisons and analyzing differences. But before any fruitful comparison can be made between figures of different periods or between figures of different stores it is absolutely necessary that the systems be uniform. With a uniform system of accounts in use, differences in items reflect differences in conditions, while without a uniform classification, differences in items may reflect only differences in accounting classification.

In order to maintain the simplicity of the system no departmentalization of the accounts is provided for, but any concern operating distinct departments can readily adjust the system to show the results obtained in each department.

A merchant in order to price his goods properly must know his overhead expenses. With a proper arrangement of his accounts the percentage of overhead may be readily obtained. Goods not priced high enough to cover this percentage are actually sold at a loss. The most convenient way of arriving at the proper percentage to add to the first cost of goods for overhead is to use the average ratio of operating expenses to net sales covering a past period. For instance, if a merchant's annual sales for the last fiscal year were $25,000 and the expense of conducting his business was $5,000, his overhead was 20 per cent. By adding the desired percentage of profit on sales to this overhead percentage and deducting from 100 gives the percentage of invoice cost to selling price. The invoice cost of an article divided by this percentage gives the selling price.

The rapidity of the turnover is a very important element in conducting a retail business. It is obvious that an increase in turnover goes hand in hand with an increase in profit. A slow turnover may be due to poorly selected stock, to overstocking, or to an inefficient selling organization. No effort should be spared to increase the turnover to its maximum. To ascertain the turnover divide the cost of goods sold during the year by the cost of the average stock carried.

Books of Account and Statements.

To operate the system of accounts here outlined requires but four books of account, namely, journal, general cash book, invoice book, and ledger. Sales tickets and credit tickets are used for recording sales and sales returns.

From these books certain statements, particularly a monthly summary of business, a profit and loss statement, and a balance sheet,

MONTHLY SUMMARY OF BUSINESS, 1916.

	Net Sales.			Buying expense.		Selling expense.			Delivery expense.		General expense.							Total Expense.	Per cent of Net Sales.

FORM A.

should be prepared at definite periods in order to present the results in comprehensive form.

The ordinary two-column journal can be used. The opening entry is an inventory of the assets and liabilities.

The totals of the charge sales as shown by the charge tickets should be entered into the journal, debiting accounts receivable, and crediting sales. The totals of the credit tickets are also entered in the journal, debiting sales with returns and sales allowances with price concessions and crediting accounts receivable.

Transactions which do not go through either the cash book or invoice book should also be journalized. These entries comprise such items as notes receivable and payable, allowances, or corrections of purchase invoice after entry in the invoice book, the various adjusting entries at the end of the month, and the closing entries at the end of the fiscal period.

Journal entries affecting trade customers' and trade creditors' accounts will also have to be posted respectively to accounts receivable account and accounts payable account.

General Cash Book.

This book is for recording all cash transactions. The left hand, or debit, side is for recording receipts, and columns should be headed as follows, in the order named: Date, name of account, description, ledger folio or LF, collections on accounts receiveable, cash sales, and general accounts. The right hand, or credit, side is for recording payments, and these columns should be headed: Date, name of account, description, check No., ledger folio or LF, discount on purchases, payments on account payable, and general accounts.

The total cash receipts of each day should be deposited daily in bank, and all payments should be made by check. The total of cash sales for the month should be checked against the total of cash sales tickets, and is then posted to the credit of "Sales," that of the "Collections on Accounts Receivable" to the credit of "Accounts Receivable Account," and that of "Payments on Accounts Payable" to the debit of "Accounts Payable Account." The total of the discount on purchases column is also posted to the debit of accounts payable.

All payments for expense items other than petty cash should be entered on the cash book as made and posted therefrom to the proper accounts. At the end of the month all expense bills for the month should be paid, so as to insure the expense being charged in the proper month.

Petty cash disbursements, such as car tickets, telegrams, and such minor items for which it is not expedient to draw checks, should be handled as follows:

A check should be drawn for an amount sufficient to cover petty disbursements for a definite period. At the end of the period the cashier should prepare his petty cash statement, which should be supported by vouchers, and a check drawn for the exact amount of the statement, thereby restoring the petty cash fund to the original amount. This check should be entered in the cash book in the regular way, charging the various expense accounts as shown by the petty cash statement.

The balance of the general cash book at all times should check with the balance as shown by the check book plus the amount advanced for petty cash.

In the check book keep checks and deposits footed separately. When the bank book is balanced, check up the bank list, then rearrange the checks in numerical order, and check with the stubs. If any checks are outstanding, note them on the stub and deduct from total of checks drawn; the check book balance will then agree with the bank book balance.

Invoice Book.

This book contains the record of the invoices or purchases of merchandise only, and should carry the following headings: Date of entry, date of invoice, number of invoice, from whom purchased, address, ledger folio or LF, and amount of invoice.

The postings are made direct from this book into the purchase ledger and the total at the end of the month carried to the debit of merchandise purchases and to the credit of accounts payable.

Where the business is departmentalized a more elaborate form of invoice book should be used, giving departmental subdivisions of purchases.

The use of sales and credit tickets for recording sales and sales returns has become almost universal.

A sales ticket must be made out for every sale and the daily total of these gives the sales for the day. The cash sales tickets are checked against the cash received and the charge tickets go to the bookkeeper. Credit tickets must be made out for credits to customers, and these likewise go to the bookkeeper.

Ledger.

The accounts in the ledger should be arranged in the following order:

1. General accounts.
2. Accounts with trade creditors,
3. Accounts with trade debtors,

allotting to each class such space in the ledger as may be necessary.

The general accounts should be arranged in logical order. (See arrangement of accounts.)

Accounts with trade creditors and with trade debtors should be arranged alphabetically, using preferably a loose leaf ledger.

Where the volume of business permits, it is advisable to use three ledgers, a general ledger, a purchase ledger, and a sales ledger, keeping controlling accounts of the purchase ledger and the sales ledger in the general ledger.

Where only one ledger is used it should be divided into three sections, corresponding with the above.

The balances of the purchase ledger and of the sales ledger, or of these sections of the ledger if only one book is used, must agree with the balances of the accounts payable account and of the accounts receivable account. The advantage of these controlling accounts is that the aggregate of accounts payable and of accounts receivable can be had at any time without listing the balances of the individual accounts.

Customers are charged with goods purchased direct from the charge tickets. These tickets are first listed, then turned over to the bookkeeper, who posts them to the debit of the proper accounts, listing the amounts he posts, then comparing his total with that of the first list, which must agree. Credit entries for allowances, reductions, cash discounts, or returned goods are made from credit tickets in exactly the same manner.

Posting to the ledger, therefore, must come from one of four sources—the cash book, the journal, the invoice book, or the sales and credit tickets.

Monthly Summary of Business.

This record, Form A, will be found very useful for monthly and yearly comparisons of expenses and ratios. It is arranged with columns for sales, both cash and credit and total, and for the various expenses of the business. The figures on this statement are taken from the ledger.

Each month the figures for that month should be added to the previous total, so that the record will give the totals from the first of the year to date as well as the monthly totals.

(To be continued.)

A Real Merchant

He was a real merchant, or this incident would have had a different ending.

A woman called at the yard he was managing and informed him that she wanted to have a hardwood floor laid in her dining-room, parlor, and bathroom, but that she had heard that oak flooring was worth from $65 to $75 a thousand feet, and, if that was true, she wasn't going to pay any such price.

The yard manager didn't say a word about the price of his flooring. He got her attention off of that point quickly by asking her for the dimensions of the rooms. He found the parlor was about 14 x 16 feet, the dining-room 12 x 14, and the bathroom 6 x 8 feet, and figured that about 550 feet of flooring would do the work.

"Madam," he said, "I can furnish you with a fine grade of oak flooring, enough to lay those three floors, for $35."

"You can!" the customer almost shouted. "Why, that's a whole lot less than I thought it would cost. Is the flooring all right?"

"Yes, it is all right. Come out here in our hardwood room and look at it."

He took her out, showed her the flooring, showed her a specimen about a yard square he had for exhibition purposes, which was nicely finished and polished, glistening brightly.

He booked the order right there, arranged to select a carpenter who was an expert at laying oak flooring, and sent the woman away feeling that she had saved a lot of money.

And he got $65 per thousand for the flooring he sold her.—Retail Lumberman.

How To File a Hand Saw

"How to File a Hand Saw," is the title of an exceptionally interesting booklet recently issued by the Simonds Mfg. Company, Fitchburg, Mass., and the Simonds Canada Saw Company, Limited, Montreal, P.Q. The information in the book is set forth briefly and clearly in five lessons. The first lesson is entitled "What is a Hand Saw?" and gives one a practical reply to this important question. The succeeding lessons are as follows:—"How do Hand Saws Cut?" "What is the Way to File a Saw?" "What Further Care Should be Given?" What are the Tests of a Good Hand Saw?" Under these headings very full information is given and it is put in such a manner that an amateur can easily understand it. Good illustrations are also included showing exactly what is of importance in connection with each lesson. Any further information desired will be gladly furnished by the company upon application.

Retailers of U. S. Organize Association

Many Cities Represented in National Body Formed at Chicago Congress—Ambitious Declaration of Principles Adopted

One of the most important steps in connection with the organization of lumber associations in the United States took place on September 11th, at Chicago, when the National Retail Lumber Dealers' Association was formed at a special congress held in that city. The organization, as established at the meeting, is composed of representative lumber dealers from fifteen of the principal cities in the United States.

The meeting was called by Edward Hines, president of the Edward Hines Lumber Company, Chicago, and there were in attendance ninety of the most prominent retail dealers in the country. The cities represented included Buffalo, Detroit, Green Bay (Wis.), Milwaukee, Pittsburgh, St. Paul, Cincinnati, Cleveland, Kansas City, Louisville, Minneapolis, St. Louis, Dayton, and Chicago. Fred J. Robinson, of Detroit, was elected president, Julius Seidel of St. Louis first vice-president, and E. A. Diebold of Pittsburgh second vice-president. Fifteen directors, one from each city represented, were also elected. The association will employ a secretary to handle the promotion and education work that is contemplated. It is proposed to organize branches of the association in every city that has a population of over 50,000.

Among the subjects discussed at the organization meeting were: The improvement of trade ethics, protection of the interests of retail lumber dealers, the exploitation of the use of wood for the purposes for which it is best suited, and the protection of the consuming public against the sale to it of grades inferior to those ordered. One of the first steps of the association was to go on record in favor of the trade-marking of all lumber products, so as to show in what mill they are produced, and the marking of the grade to insure the consumer that he is getting exactly what he asks for. The association will co-operate with the National Wholesale Lumber Dealers' Association with a view to promoting the interests of the lumber industry as a whole.

Declaration of Business Ethics

The declaration of business ethics and business methods agreed upon by the National Retail Lumber Dealers' Association covers a wide range of subjects, of the utmost importance, and while it is drawn up with special reference to conditions in the United States, nearly everything in it has a special significance to the trade in Canada, so that we expect it will be interesting to all our retail readers. The declaration is as follows:—

Sec. 1. The retail yard lumber dealers having made investments in necessary equipment and stock for the purpose of engaging in the business of supplying the needs of a particular community with lumber, the association believes they should be protected in their legitimate business of assembling lumber of various kinds and retailing the same to the public, and that the manufacturer should recognize retail lumber dealers as the proper agents for the distribution of his manufactured product.

This association, therefore, earnestly protests against the retail yard lumber dealers being compelled to compete with those manufacturers and wholesalers whose lumber they purchase, and declare that it is the duty of retail yard lumber dealers to take all lawful measures to ascertain the names of the manufacturers and wholesalers of lumber who solicit or accept orders which legitimately belong to the retail lumber dealers and who injure the retail lumber business by selling, directly or indirectly, to the contracting and consuming trade.

Dishonest Practices

Sec. 2. Evils now exist in the lumber industry arising from the dishonest practice of mixing grades, giving short measure or misrepresenting the character and quality of lumber, which is chiefly done by wholesalers and in a lesser degree by manufacturers. The association urges all retail yard lumber dealers to condemn such practices and to take all lawful steps to ascertain who make it a practice to mix grades, give short measure or misrepresent the character and quality of the lumber they offer for sale, in order that the retail lumber yard dealers may protect themselves and protect the public whom they serve against such dishonest practices.

The membership of the association of lumber manufacturers affiliated with the National Lumber Manufacturers' Association is made up of manufacturers of various kinds of woods, who stand for uniform grades, for full and honest count, for fair and equitable adjustment of disputes, and the highest business ethics, and who guarantee, so far as possible, the character of the lumber they sell; and the members of this association declare it to be their experience that more satisfactory relations will be brought about by confining purchases to such manufacturers, rather than dealing with manufacturers and wholesalers who are guilty of the foregoing dishonest practices.

Sec. 3. This association heartily endorses and will support the efforts of all associations of lumber manufacturers which are devising ways and means for the branding of the product of their members and thereby assuring, within a reasonable variation, the integrity of the grade, as well as making possible the identification of the stock, with consequent protection to the retail dealer and the consuming public.

Trade Mark

Sec. 4. This association recommends that a national trade-mark be adopted for the use of the members of the association.

Advertising Lumber

Sec. 5. The retail lumber dealers recognize that their interest lies in the sale of lumber and they are directly benefited by the advertising campaigns which are being conducted by the National Lumber Manufacturers' Association, and by the several associations of lumber manufacturers affiliated with the National Lumber Manufacturers' Association, for the promotion of the use of lumber. This association, therefore, most heartily endorses all efforts directed to the promotion of the use of lumber and commends those manufacturers who are aiding such promotion by the financial support which they are giving to the National Lumber Manufacturers' Association.

This association approves the efforts of the National Lumber Manufacturers' Association in advertising the good qualities of lumber and believes that such work should be supplemented by aggressive local campaigns in the various cities whereby the sale of lumber may be promoted and its good and useful qualities fully expounded to the public and its use increased.

This association recommends to the manufacturers of lumber that they place upon their office stationery and advertising matter the information that they are members of or affiliated with the National Lumber Manufacturers' Association; and recommends that the members of the National Retail Lumber Dealers' Association place upon their office stationery and advertising matter the information that they are members of the National Retail Lumber Dealers' Association.

Restrictions in the Use of Lumber

Sec. 6. This association pledges its support to the members of the association of lumber manufacturers to do what it consistently and legally can to aid them in combating all unjust and illegal efforts which may be made to restrict unreasonably the use of lumber in any district or community.

Shipments from Retail Yards

Sec. 7. Believing strongly in ethical business methods in fair and legitimate competition, this association declares it to be its judgment that yard lumber dealers who ship materials to contractors or consumers located outside of their own territory are not pursuing ethical business methods and are not engaged in fair and legitimate competition.

Resolutions

Whereas, great damage to the lumber industry has resulted by reason of the shipment from manufacturing points of material either poorly manufactured or of inferior wood or not up to specification or grade; and

Whereas, such business methods have greatly injured the reputation of lumber as a building material and have caused much loss of business by the consequent use of substitutes; and

Whereas, the members of this body, standing close to the consumer in the lumber trade, are determined upon giving to the consumer at all times material fully up to specifications; therefore be it

Resolved, that we herewith approve the efforts now being made by the various associations of lumber manufacturers to improve and elevate the lumber business by more careful manufacture and grading and that we in particular commend the movement hereafter to brand all stock showing its kind and grade; and be it further

Resolved, that we condemn as subversive of the best interests of the public and the trade the practice which has grown up of the shipping of unsold cars in transit, resulting as it does in the tying up at all times of a large amount of rolling stock and the continual forcing upon the market and the consumer of great quantities of material of inferior quality and manufacture and in the shipping of cars in transit the original shipper and point of shipment being generally concealed, thus making it impossible for the buyer to know what class of stock he is getting or by whom manufactured; and be it further

Resolved, that the true interest of the public and the consumer will be best subserved by refusal hereafter to purchase any material so offreed upon cars in transit.

The One Price Idea in Retailing

A Plan That Can Be Worked Out With Benefit to Merchant and Customer

The manager of a large retail company, who put into practice a "one-price" idea and found it a great success, refers to it in a letter to his customers and prospective customers in the following manner:

"We have a special service department in our general office, made up of building experts, architects, and draughtsmen, whose duty it is to design buildings especially adapted for use in our territory, with material lists using the best grades in construction for the purpose which cost the user the least money.

"If our customers cannot find in our plan book just what they require but can give us a suggestion of their ideas, our service department will plan until our customers get just what they wish. If a customer is thinking of building and sees a picture anywhere of a home that suits him, but which does not appear in our plan book, or if the arrangement or size in the building he has picked out is not just what he wants, our service department will work out this idea for him in detail and submit it.

"Many times you see a home that you think would be just what you would like to have, yet it looks so attractive that you feel the cost would be more than you would care to put into a building. This may not prove true if you avail yourself of the service our company is able to give you, which is free of charge and for you to use for this purpose.

"We have better farming experts in our organization who gladly work out problems for the arrangement and design of farm buildings. We want you to come to us for honest counsel as to the best materials to be used for such purposes.

"To illustrate my meaning more clearly I will ask, 'If you were to buy a diamond, would you not go to a man in whom you had implicit confidence both as to his honesty and ability to judge diamond quality and value? Yet when it comes to buying lumber most people come to a lumber yard with grade marks on their bills—a business that we know requires just as expert judges to determine grades as the diamond business. This may seem a pretty broad statement, but I think I can prove it to you.

"There are three sources of lumber supply for our district.

"The spread in price from the lowest to the highest is something like $41! Each grade is a different price. Each grade is good for a certain purpose. They may look alike, but one will be worth nearly twice as much as another. Surely great care must be taken by the BUYER!

"A manufacturer of lumber in one district cuts four or more different kinds of trees into merchantable lumber, from which expert lumber graders find twenty-one or more different grades of lumber.

"In another district a manufacturer cuts five or more different kinds of trees, from which expert graders find twenty-four or more grades.

"In a third district a manufacturer cuts four different kinds of trees, from which expert graders find eighteen grades of lumber.

"A grade of lumber is determined by experts in value according to the use to which it is to be put. The expert grader must have expert knowledge of the uses of different kinds of wood, the different grades of wood, and every known use of wood, in order to determine the value of the different grades.

"The commercial difference in value between the lowest and highest of these twenty-one grades manufactured to-day is $41 per thousand. The difference in value between the lowest and highest of the twenty-four grades to-day is $38, and the difference in value between the lowest and highest of the eighteen grades to-day is $35.

"This means that we have 63 grades of lumber from which to supply our various yards, with a range in value of over $40 from the highest to the lowest.

"Let me go a little further in this line of thought. I said that lumber grades were determined by expert graders in value according to the use to which the lumber is to be put. The product of different kinds of trees using the same wording for grading cannot be commercially used for the same purpose because of the peculiar qualities of the various woods. This will give you an idea as to the complexity of grades. Think of the difference in value of $41 per thousand between the high and low grades and the different uses to which they can be put and the different grades from the different districts that can be used for the same purpose. Am I not correct when I say that in buying lumber you should be just as particular where you buy it as you would if you were buying a diamond or some other article where expert judgment was needed to determine actual values? This is another reason why our company adopted as a policy 'One Right Price to Everybody,' and the best material for a given purpose for the least money.

"I found in my experience when traveling that different communities called for different materials to be used for exactly the same purpose. This proves that no one in particular told the user what was the best material for his purpose, and that custom only prevailed. They are using the same material to-day, and the reason they are using it to-day is simply because the men who are doing the building in each of these cities to-day served as an apprentice under the carpenter and contractor who was doing it this way twenty years ago. He in turn served his apprenticeship under the carpenter who did the same thing twenty years before, and so on.

"Old-time lumbermen themselves did not teach the user the best material to use for the different purposes for the least money. They worked along the lines of least resistance. Our local managers are taught to be salesmen, and not order-takers, and to sell our customers the right material for their different uses. When they do this conscientiously and honestly, our customers come to us for advice, and profit by doing so.

"No matter what price is quoted, there is always some grade that can be supplied that will fit the price made. The customer doesn't buy what he really intended to buy. He invariably loses by dickering.

"Users of lumber have been in the habit of getting a lumber bill made out for a prospective building. Usually this is done without plans. It is impossibe for any man to draw up an accurate material list without plans. The user then goes from dealer to dealer to get this bill 'figured.' He only knows the comparative value by prices given him in a lump sum by these different dealers. I think I have made plain how one-sided this kind of a proposition is, since there are so many different sources of supply, with so many kinds of trees, with an endless number of grades requiring experts to distinguish them apart and with so great a difference in value between the grades. Why cannot a dealer sell a bill of lumber for the price you wish to pay for it and take his assortment of grades from his different sources of supply that will fill the bill as sold by him at a handsome profit?"

A Severe Report Upon U. S. Lumber Industry

The United States Forest Service has completed a summary report of its study of the lumber industry, which, according to advance information contains a severe but constructive criticism of lumbermen and their methods. The report, it is understood, takes the position that the lumbermen generally have not known how to run their own business. It shows that the lumbermen have been operating in a haphazard way for years. Not knowing what it cost them to manufacture lumber, it is said, they did not know at what price to sell it. The result has been, according to authorities, that there has been little lumber sold in the United States since 1907 at a profit.

It is shown in the report, according to people qualified to state, that there have been some exceptions to the general rule, particularly in the case of the cypress manufacturers and the Northern pine lumbermen, more especially the former. By reason of organization, scientific methods and extensive advertising, it is said to be shown in the report, they have demonstrated that they know more about their business than other lumbermen generally know about their respective lines of business. Cypress and Northern pine have been selling at prices sufficient to cover expenses and provide a profit, it is said by government experts.

The price of stumpage has gone so high that it is said to be demonstrated in the report that there is little chance for the business of many lumber concerns to get on a profitable basis.

New Invention May Save Shingle Industry

According to information in the hands of the West Coast Lumbermen's Association, an Iowa pharmacist, after seventeen months experimenting, has produced a liquid which makes wooden shingles absolutely fireproof. In a test of the new fireproofing liquid, made at the University of Iowa by the inventor, a block of wood one-half inch thick was saturated with the fireproofing and then placed in running water for twenty-four hours. After that it was thoroughly dried again and held for one hour over a Bunsen burner, which had a temperature of between 700 and 1,000 degrees Fahrenheit, that being a much greater heat, it is said, than is developed in a conflagration. The wood was not burned and only charred very slightly at the point of the flame. The new compound is reported to be sufficiently low in cost to make it practical in connection with shingle manufacture, and when a shingle is saturated the moisture drys out, leaving an insoluble mineral fireproofing substance in the fibre cells of the wood, which cannot be washed out with water and is said absolutely to prevent combustion.

Vessels Not Completed But Already Chartered

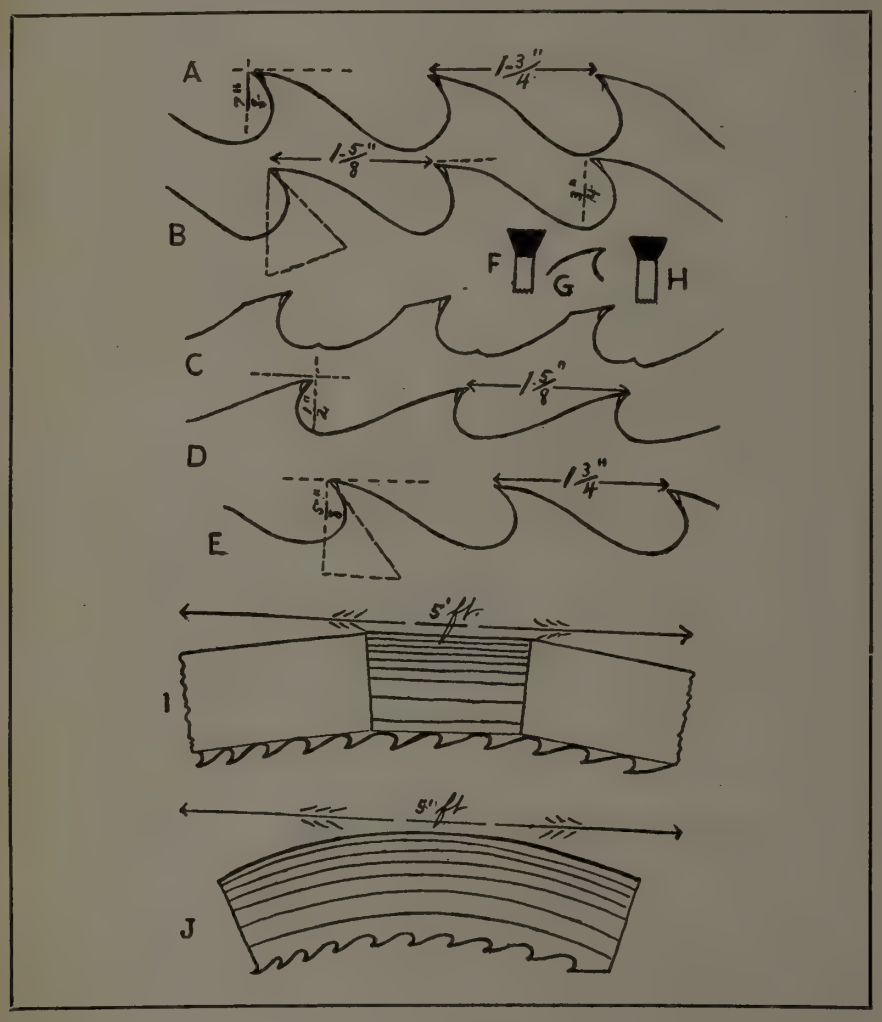
The great scarcity of tonnage on the Pacific Coast is clearly illustrated by the fact that the wooden auxiliary schooners now under construction at the Wallace ship yards at North Vancouver, for H. W. Brown and Company, of Vancouver, have already been chartered to carry lumber from Vancouver to Australia. One schooner has been chartered to carry lumber from Hastings mill to Sydney at 120s, loading in March or April. Another has been chartered to carry lumber to Sydney at 120s or to Melbourne at 130s, loading in December or January.

The Band Mill and Saw

When the bandmill and carriage track are in correct alignment the saw should be carefully inspected to see that everything is in good shape. Tension in the saw is supposed to be of the greatest importance, but in fifteen years' experience in filing saws for fast mills that cut both hard and soft woods tension is shown to be only one of the things that must be looked after carefully. There are as many ways of running tension as there are filers, but the following method will allow the bandsaw to stand up to the greatest rate of feed and at the same time prevent cracks.

Extreme tension is as bad as low tension and to find out how deep to go in the case of 12-inch saws see that the saw is perfectly levelled and tension from edge with a 45-foot circle gauge, making the curve fit snugly when the gauge is held square with the saw on pressing it down. Then roll or stretch the entire saw lightly on both edges to release the strain on the extreme edges as this treatment will push back the strain line an inch and prevent cracking.

Then run the saw for a few days until either the centre, quarters or edges develop bright lines or spots from "riding." These spots can be easily detected by holding the saw at such an angle as to allow the light to shine directly upon the blade. If riding develops after putting in tension with a 45-foot circle gauge go deeper with either a 40 or 36-foot circle gauge and if bright spots still appear after running use a 32-circle gauge. If bright spots still develop more than 1 inch from the edges the band wheels need refacing or grinding perfectly flat. When the bright lines disappear from the centre and quarters and only show 1 inch from the edges the correct tension for the mill has been secured.



Badly worn wheels require more tension than flat ones. In fact, the centre or quarters of a saw should never come in contact with the face of the bandwheels, for when the saw is fitted by the method recommended the saw is air cushioned and sustains the strain only on the edges, making it impossible for the saw to snake or cut bad lumber.

The shape of the saw teeth and the swage have a great deal to do with the proper running of the saw. The sawdust must be expelled when it is cut out of the timber and to do this the gullets must be as round as possible. Sketch A shows a very successfully shaped saw tooth for hardwoods and mixed woods. B is similar to A but with only 1⅝-inch space, which is especially good for all species of pine. C shows a tooth ruined by the filer grinding back into the swaged-point harder than grinding down on the back of the tooth. D is an ideal tooth for the resaw. E will give especially good service when the resaw is sawing oak. F is a good pine swage point. G shows a type of side cutter. H is the best swage point for hardwood. I illustrates a method of crowning a saw back that should be avoided. J shows the proper manner of crowning a band saw. Avoid extreme crown in the saw, as just enough is needed to overcome the slight stretch of the cutting edge. For a 12-inch 14 gauge bandsaw about 1/32-inch for every five feet is enough for most mills.—R. C. Leibe, in The American Lumberman.

First Aid Principles

Compiled by Dr. W. N. Lipscomb, Field Bepresentative, American Red Cross

1. The best way to treat any injury is to prevent it.
2. The best test of any man is his ability to meet any emergency—remember this in accident cases.
3. First aid work merely means applied common-sense based on a little extra knowledge.
4. The fate of an injured man depends upon the individual into whose hands he first falls.
5. The man afraid to apply first aid, knowing how, is a coward; the man who calls it "hot air" is dangerously ignorant; the man who does the right thing at the right time is the real man.
6. The blind rush to a hospital without first attempting relief is insanity—patients have died on the way from loss of blood and shock.
7. Seventy-eight out of every hundred cases of infection or "blood-poisoning" begin in the hand—remember this when you get an injury there.
8. Do not drill a black finger-nail with a knife—it may cause a whitlow or bone-felon.
9. The little wounds are dangerous—often more so than the large ones—give them immediate and careful attention.
10. Do not "wash out" any wound with water—it merely drives the "germs" deeper in.
11. A man spent 368 days in a hospital in the State of Washington because he let another man pick a splinter out of his hand with a pocket-knife—will you be the next to contract such a case of general "blood-poisoning"?
12. If you have nothing surgically clean to put on a wound, leave it exposed to the open air—it is safer.
13. Keep your hands, clothes and handkerchiefs out of a wound—it is dangerous to so tamper with them.
14. Keep cotton out of wounds and burns—do not force a surgeon to "pick the goose alive."
15. A man's eye is a delicate piece of machinery—keep sharp tools out and avoid the dirty ones.
16. In treating fractures (broken bones) anywhere, first cut away clothing—there is often a wound present.
17. Many a simple fracture has become compound from hasty or rough handling; a man who has a fracture is likely to have an open wound through the protruding of sharp end of bone if mishandled.
18. Properly splint or immobilize a patient's limb when broken, before moving him. It may save many months in the hospital and a possible bad result.
19. Never move a man with a broken limb before you see that it is placed in well padded and comfortable splints.
20. If in doubt whether break exists anywhere, fix as such—this treatment cannot do harm; it may help greatly.
21. Prevent a man from walking on a sprained ankle—one or more bones in the foot may be broken.
22. Elevating injured arms and legs in case of accident means increased comfort for the patient, especially in even of crushed injuries.
23. The coat makes a good sling—hold injured arm horizontally across chest—fold coat over arm and secure the corner near the neck with a pin or nail. Also pin behind to steady arm against shoulder.
24. In making an emergency stretcher, first try it out with an uninjured patient—it may prevent serious consequences.
25. Walk slowly with patient feet foremost on a stretcher—why needlessly shake him up.
26. In applying a tourniquet or "twister" be sure to loosen gently about every twenty minutes—this is an absolute rule for comfort and safety.
27. The tourniquet is "a good servant, but a bad master"—be sure that you apply it correctly, and use something broad, not wire or rope.
28. Keep an injured man's head low, loosen clothing, look for external injuries, keep him warm, but yourself cool, handle as little and as gently as possible.
29. Lowering a patient's head in a case of fainting is the first and main essential in treatment.
30. To deal with an epileptic fit—prevent person from falling, place a stick or handkerchief between teeth, then observe "watchful waiting."

Oak Flooring and Floor Laying Troubles

By W. L. Claffey*

Oak flooring troubles originate from many causes. Oak flooring is made in a scientific way, and the different processes from the rough oak lumber to the finished flooring are subjected to the most careful inspection and scientific tests. The object of this article is to cite actual cases that have come under our observation through an expert inspector whose sole duty is to investigate complaints on oak flooring. This inspector is employed by manufacturers, and has qualified as an expert on oak flooring.

Not long ago he was called upon to examine an oak floor that had bad crevices every eight inches. He went to the cellar and found that the sub-floor ran parallel to the oak flooring. The boards in the sub-floor were eight inches in width. The sub-floor shrank, as most sub-floors do, with the result that it made the crevices appear in the oak flooring. The floor layer that laid the floors remarked that he never laid oak floors before, and thought that he was laying them the proper way. The contractor was forced to take up the oak floors at quite an expense, and new floors were laid the proper way, or at right angles to the sub-floor.

Oak floors were laid in a large apartment building while the doors and windows were not yet in place. The flooring was in bundles for about two weeks spread about the different rooms, and rain and snow drifted in on the bundles. The result was that many pieces absorbed moisture near the ends, and when the floors were laid, bad looking crevices appeared. No attempt was made on the part of the contractors or owners to heat the building. The time was in December. The owner claimed that he was unable to get the heating system installed, and did not know that it made much difference whether a building should be heated or not for oak floor laying. The superintendent of the job, representing the architect, made no report to the architect on this condition. Some of the floors had to be torn up and replaced with new floors at quite an expense to the owner.

Floor Layer Used Sledge Hammer.

Another case was brought to light where a floor layer used a heavy sledge hammer in driving up pieces. He drove the pieces up so tight that the floor had the appearance of waves. The superintendent of the job informed the floor layer that he was driving it too tight at the time, but the warning was not heeded. The result was that the whole floor had to be torn up and replaced.

A few months ago a beautiful oak floor was badly damaged by improper nailing. The nails were driven at an angle of about 90 degrees, which made it almost impossible to drive the piece up snug. Many bad crevices appeared. When the owner was advised that nails should be driven at an angle of about 50 degrees and when it was demonstrated to him in some of the rooms that had not been laid how the strips drove up after nailing at this angle, he compelled the contractor to tear up the floors in three rooms. They were replaced at the expense of the contractor. The contractor, we found out later, was a novice at the floor-laying game—in fact, it was his first venture.

Oak floors were being laid in another case, and the floor layer complained to the owner that the pieces would not fit up snug. Our inspector went to the job and fonud that the flooring layer was not driving the nails below the tongue. Most of these nails extended one-fourth inch above the tongue, and the result was that it held the next piece out. As soon as the nails were countersunk or driven down further the pieces fitted up perfectly. The case brought out the fact that this was about the second job the floor layer ever had. The owner now is suing the contractor for new floors.

Ballroom Had to Be Relaid.

About ten months ago a ballroom was laid with oak flooring amid the worst possible conditions. The owner issued instructions that the floor should be finished by Christmas, in order to have a ball that was widely advertised. The contractor, who was an experienced flooring man, informed the owner that he would not under any circumstances lay the flooring, owing to the plaster being green and damp, together with the sub-floor covered with wet cement. The owner then took the matter into his own hands, and cancelled the flooring contract with this contractor and engaged another one and had the floors laid, with the result that in two weeks' time the floor started to buckle up, making it unfit for a dance floor. The owner then went back to the first contractor and gave him full authority to go ahead and make a good job, regardless of the time of opening up. The entire floor had to be torn up and replaced at an enormous expense to the owner.

Another case brought out the fact that oak flooring was laid even before the plaster work was started. Thin building paper was placed over the oak floors, and the plaster work was finished. In a very short time the oak flooring started to bulge up in revolt, caused by the moisture absorbed from the wet plaster. The eight floors in the house had to be torn up and replaced. In this particular case the architect was entirely to blame, as he issued instructions to the contractors to have the oak floors laid first and plaster work afterwards.

Last winter a beautiful oak floor was badly damaged in a large, expensive residence, chiefly caused by the dealer, who stored the oak flooring in an open shed, exposed to the elements. All the ends absorbed moisture fully one-sixteenth of an inch. When this flooring was taken to the jobs is naturally left large crevices, starting at the ends down to about twelve inches. When all the facts of the case were presented to the architect, he placed the blame upon the dealer for the improper housing of oak flooring.

Floor layers, before they start on an oak flooring laying job should invariably make a rule to do some examining work before proceeding. First, examine the condition of the plaster and the sub-floor, to ascertain if they are thoroughly dry. Second, examine the oak flooring to find out if it has absorbed any moisture at the lumber yard or in transit. Third, if in winter, see that the temperature of the rooms is about 70 degrees, and that they have been that warm for a week or ten days with the oak flooring in bundles in the different rooms. If this is done it will eliminate a great many of the flooring troubles and save unnecessary expenses.

* Secretary of the Oak Flooring Manufacturers' Association. Reproduced from the Southern Lumberman.

The Value of Lumber in Home Building

The modern system of merchandising building materials is to lay emphasis on what the materials will produce—the complete structure—instead of on the materials themselves. In selling material for specific purposes, it is, or should be, the purpose of the dealer to point out results rather than to lay stress on the quality of the material as it appears in the unfinished stage. In lumber—to which this article pertains—the dealer may tell the prospective buyer that a certain kind of material will make good interior finish, but to prove it he uses samples that have been finished to appear as they will when they are in place in the building. A number of associations of manufacturers have come to the aid of the dealer by furnishing free samples of their woods finished with various stains for the purpose of illustrating what the wood will look like when the building is completed. This is what interests the builder more than anything else. He is buying a home—not the material that will make a home. And for the average home, if not for the most pretentious mansion, wood is the most satisfactory material, for both out and inside.

The Ohio Association of Retail Lumber Dealers is promoting this idea by the circulation of a pamphlet written by a Cleveland lumberman, and the statements contained in this pamphlet should be made talking points by every dealer in building material, for lumber is the chief article in the stock of this class of merchants. Some of these points follow.

Wood is the most available material at all times and in all places. It is always ready, and can be secured upon a moment's notice, for a complete stock can be found in every community. Wooden structures can be moved, repaired, or rebuilt more easily and more cheaply than structures of any other material. It is easily worked with common tools. It is a non-conductor of heat and electricity, as compared with metal, and a non-conductor of moisture, as compared with ordinary concrete and brick. It has varied and beautiful figure which no other material will ever compete with, for furniture, house trimming, and general decorative purposes, and it is the cheapest material for home building on the market.

Perhaps one of the best arguments in favor of wood for home building is the fact that from time to time the color scheme of the home can be easily changed. Ideas and styles change, and wood homes can be easily changed to meet these requirements.

It has been argued that wood does not give the appearance nor the service demanded by those who desire permanency. The answer to that argument is found in the hundreds of wood homes built one or two hundred, or more, years ago, which, properly cared for, have withstood the ravages of time and are to-day among the best types of architectural beauty to be found in this country.

As a part of this argument it is claimed that homes of wood are invitations to fire destruction, and it is all based on the statement that wood will burn, while the other materials urged for home building will not. This is a hopeless argument when the effort is made to prove that wood homes are a fire menace. Statistics of the large cities, where the fire hazard is greatest, do not develop the fact that there is sufficient danger of loss by fire in frame dwellings to substantiate the statement, or to influence the home builder to the choice of other materials.

If statistics proved any such thing the fire insurance companies would have long ago taken cognizance of it. As it is, the insurance rates on detached homes of frame construction are as low as on structures of any other material similarly located. Interested parties have of late been working with city officials to limit the use of wood, and particularly the use of wood shingles, in the building of residences, but, though they have been successful in a number of instances, they have not been able to succeed through the presentation of competent evidence to support their cause. Even in business and factory buildings it is recognized that factory construction, properly cared for, is not inferior as a fire hazard, to construction of other materials.—Mississippi Valley Lumberman.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Wanted

200 cars Sawdust.
2,000 cords Hardwood or slabs.
Box 460, Canada Lumberman, Toronto, Ont. 19-19

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Lumber Wanted

We are in the market for a quantity of Birch, Soft Elm, Hard Maple and Basswood, dry stock, for immediate shipment. Will be pleased to receive full particulars as to quantity, grade, and lowest prices. Apply, The London Lumber Co., Ltd., London, Ont. 18-21

For Sale–Lumber

For Sale

Three carloads of 1 in. No. 2 and 3 Common Maple. The Bradley Company, Hamilton, Ont. 18-19

Cedar Ties

Wanted a buyer to contract for 10,000 No. 1 and 2 Cedar Ties, for next spring delivery. Box 447, Canada Lumberman, Toronto, Ont. 18-19

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO C. GOODFELLOW,
Montreal, Que.

For Sale

1 car 1 x 4 in. and wider, 37 in. long.
1 car 1 x 4 in. and wider, 31 in. long.
1 car 1 x 4 in. and wider, 22 and 25 in. long.

Dry Quartered White Oak, Clear 1 face 2 ends and 2 edges, 2 years old, nicely figured, Ohio stock. Write us for delivered prices.

PROBST LUMBER COMPANY,
18-21 Cincinnati, Ohio.

For Sale

We have the following stock for immediate delivery:—

50,000 ft. 3 x 6 Hardwood Hearts, mostly Maple.
25,000 ft. 4 x 4 Hardwood Hearts, mostly Maple.
200,000 ft. 1 in. Hardwood crating, principally Maple and Birch.
100,000 ft. 1 in. Birch, No. 2 Common and Better.

Business Chances

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 18-21

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, cross-cut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.
Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

Miscellaneous

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of December next for the right to cut pulpwood and pine timber on a certain area situated on the Pic River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet, board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for twenty-five thousand dollars ($25,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $25,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, August 28th, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 18-22

British Timber and the War

We have been visiting several of the Canadian and other camps where home-grown timber is being felled and converted, and must certainly say that the work, generally speaking, is being carried out in a practical and business-like manner. What surprised us most at every felling station was the quality of timber being dealt with, much of that at Windsor, the Scotch fir in particular, being quite as large and of equally good quality to any that has been sent from abroad, a fact that was freely commented on by several managers of woodlands with whom we were in company. Some very fine timber is being cut from the hillsides above Gwydyr Castle, in Wales, the larch especially being remarkably clean, of great length, and the timber first-class in quality. Whole plantations are here being swept away, and the visitor after the war will find a sadly changed landscape away amongst these Welsh hills that he loved so well. But the exigencies of the war know no bounds. In the New Forest the Portuguese tree-fellers, some 26 in number, are doing useful work, and the rapidity with which the trees are felled and prepared for use is simply marvellous. They seem to be an industrious lot, working from dawn to dark, and evidently subsisting on what the English tree-feller would consider as meagre fare.—Timber News.

Black Walnut Again Popular for Furniture

The demand for black walnut for the manufacture of gun stocks, billiard cues and other articles requiring this scarce product has stimulated a return to the demand for walnut for furniture.

The return of black walnut as a popular furniture material will arouse an enthusiastic interest at least on the part of those who are in middle life and who can recall the dignity and beauty of this durable forest wood cut and carved into bed, bureau, table and dresser.

Just why it lost out in popularity, except for scarcity, it is difficult to understand. Possessing a natural wood color, it is susceptible to treatment that easily develops a beauty unsurpassed even by mahogany, which demands artificial coloring in bringing out its rich effect. And as for oak, natural, or artificially colored, it cannot be compared with black walnut for beauty, durability or any other qualities that make a piece of furniture which satisfies.

Fortunately for the lovers of black walnut—and they are as numerous as those who have enjoyed the beauty of it in their homes—it is said the American supply is far from exhausted; and on the other hand, unfortunately there is such a demand for it in the manufacture of small arms as must unquestionably boost the price of it. Enough black walnut is consumed in making a single gun stock to make a couple of chair legs.

Many a strong, dignified, beautiful and substantial piece of walnut furniture has been consigned to the garret within the last twenty years, and often to make way for a piece of cheap mahogany that could not compare with it. Housewives will naturally begin to realize their error, now that black walnut is coming again into vogue and there will no doubt be a ransacking of garrets to haul out and revitalize what of it has not gone to the junk dealer and the second hand furniture man.

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company**, of Easton, Md., after giving the "Morehead" system a thorough trial.

Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—

—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.

Save **fuel** by bringing the pure condensation directly back to the boilers HOT!

Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.

Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

Canadian Morehead Mfg. Company
WOODSTOCK, ONTARIO

Review of Current Trade Conditions

Ontario

The Ontario lumber trade has been fairly encouraging during the past fortnight. Apparently the retail trade throughout the country districts and also in the small towns is finding quite a fair demand, and as most of them have very small stocks on hand, the improvement is felt also by the wholesale trade and the manufacturers. One prominent wholesale firm report that they are getting plenty of orders—in fact, considerably more than they can handle, on account of the scarcity of cars and of labor for shipment at the mills. This firm, however, tell us that they are managing to make delivery on a fair number of orders, and that if retailers will exercise a moderate amount of patience they will be able to keep them fairly well stocked up. The actual demand at present, according to this firm and others from whom we have received reports, is just about normal for this time of year. One firm, in fact, advises us that it is receiving more orders than it would expect to receive in an ordinary year during the early fall months, and that apparently the war situation is not preventing farmers and others who require lumber from spending some of their money upon it. This is not an extraordinary situation, because it is simply a reflection of the fact that Ontario farmers have been doing very well of late years, particularly during the past year and a half to two years, and in the great majority of cases now have quite sufficient money to spend some of it upon buildings without feeling the pinch. "Every place we go to in the course of our visits to the trade they seem to be waiting for us now, and not sorry to have us call upon them. A short time ago we were not really very welcome in many of the places we called." This is the way another wholesale firm sums up the situation. Retailers, however, are not showing any inclination to lay in stocks by way of speculation. They have contracted the habit of buying simply what they know they can sell, and are continuing this practice at present. It is not unlikely, however, that by next spring, at the latest, the increasing cost of production for lumber will have its effect upon this situation also, and that some wise retailers will lay in more extensive stocks than usual, in anticipation of considerable price advances. The chief demand at present is for pine for various finishing-up purposes in connection with buildings started earlier in the year. There is a fair demand for shingles, and prices are about steady.

Eastern Canada

Some improvement is noted in the export business from St. John, N.B., both for trans-Atlantic and American markets. Fair quantities of deals, scantlings and boards are being disposed of to the Allies, presumably for trench uses. Shipments of this nature recently amounted to about 7,000,000 feet in one week. There is very little trade with England at present for the purposes of home consumption. Stocks of English deals are rather heavy and the trade is quiet.

The production of stock by portable mills in New Brunswick during the coming winter is likely to be heavier than was expected a short time ago. Portable mills now figure that they can sell their season's cut of deals at from $18 to $19. The high cost of operation in the woods, however, will necessarily keep down the volume of production from this source.

Local trade at St. John is quiet. A fair amount of repair work is in progress, but very few large buildings are going up. Low grade stocks are quiet and spruce boards are firmer. Shingles are practically off the market.

The lumber market in New England is very firm. Spruce dimension has advanced to $28 and random shows an advancing tendency. In fact the price of random has stiffened to the extent of about $1 per thousand of late. Pine box lumber is very firm and shows an advance of at least $1 per thousand, probably nearer $2. There is a strong demand for spruce lumber at Boston and a good demand for pine box lumber. Intermediate grades of pine such as common are also showing a tendency to advance.

The outlook in connection with the building trade at Boston is exceptionally good. Great activity is expected this fall and further price advances are predicted. The hardwood market at Boston continues firm and fairly active throughout the list. Maple is meeting with particularly good demand and prices are stiffening. Much the same may be said of plain oak and ash. Stocks of dry ash and maple at mill points are light. Current quotations on 1st and 2nds inch include the following:—basswood $44, maple $41 to $43, plain oak $63 to $65, quartered oak $89 to $91, red birch $57 to $59, sap birch $47 to $49, white ash $56 to $60. There is a better feeling for hemlock at Boston and higher prices are being asked in some cases. Fairly dry clipped boards 10, 12, 14 and 16 feet long are bringing $22. There is a good demand for hemlock plank, but hemlock dimension is quiet.

Shingles at Boston are fairly active and somewhat firmer. White cedar extras are in fair demand at $3.50 to $3.60 and clears at $3.20 to $3.30. Red cedars are bringing $4 for the best. Lath are in better demand and 1⅝-in. are bringing $4.25.

United States

The car shortage in the United States has become more pronounced during the past fortnight than it was previously and complaints are now made from practically all parts of the country. The lumber industry is suffering along with all other lines of business. Southern pine manufacturers report an increased demand, with orders in excess of production by 19.72 per cent., and in excess of shipments by 10.46 per cent. Many of the southern mills report more orders coming to hand than they can take care of. An especially strong demand is reported for heavy construction timbers at good prices. It is reported that the British Government is in the market for seven million feet of yellow pine in 6 x 6 up to 35 cubic average. No definite reports have been received, however, as to the placing of business. The export trade in yellow pine continues to suffer on account of the lack of vessels for shipment. Otherwise there would be a very heavy export movement.

Manufacturers in the Pacific Northwest are disappointed to some extent in regard to the volume of yard stock buying. There is an increased enquiry, however, for car material and for railroad construction material and many mills are receiving more actual cutting orders than for some time past. The latest weekly market review of the West Coast Lumbermen's Association shows some curtailment in production, 110 mills reporting a production of 68,254,296 feet for the week ending September 16th, which is 11,250,407 feet, or 15.27 per cent. below normal. The rail trade shows shipments exceeding orders to the extent of 2,375,000 feet, or 5.19 per cent.

The local market at Chicago shows no important change, but the improvement recently reported is well held. This applies chiefly to hardwoods. A slight increase is being asked for yellow pine by some in the trade, but others do not think the business at present justifies it, as local yards have large yellow pine stocks. Hemlock is moving well. The white pine business at Chicago has been quiet of late and confined chiefly to low grade stuff for the box factories. Enquiries for upper grades are numerous, but stocks are hard to find. There is not much activity in northern pine at Buffalo, but the trade is about normal for this season. There is no buying in advance in large quantity, nor is any expected until after the election in November. The lower grades are in good demand on account of the large volume of building in progress. A good volume of business is reported in northern pine from North Tonawanda, with orders on the increase and an indication of price advances. Receipts are large.

The hardwood situation is improving steadily. The August sales report of the Hardwood Manufacturers' Association shows a greatly increased movement as compared with July. Prices for most of the woods are reported stronger. Factories in northern territory are stocking up heavily. Birch and maple are strong and low grade birch and basswood are being cleaned up.

Great Britain

The latest information available from Great Britain indicates that the fall in values of wood goods previously reported has come to an end and there is a general feeling that an all-round improvement may be counted upon. A fairly active trade is looked for during the autumn, though, of course, the greatest volume of trade will be that in connection with government work. There has been considerable activity on the spot market at London of late and holders of stock are firm in their ideas of values, partly on account of the scarcity of offerings. Dock stocks at London are below normal, but a fair quantity of wood is on hand in importers' and merchants' yards. The best demand continues to be for the large dimensions, especially good quality deals. Scantlings, on the other hand, are easier. Prices recently have shown extensive fluctuations and anyone selling at present figures seems to be taking a loss.

At Liverpool, the trade continues rather quiet, but better things are to be hoped for during the fall. Freight room is rapidly becoming more difficult to secure and it is expected that rates will soon be up again to their former high levels. Arrivals have recently been

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

almost nil. The success of the Allies in gradually pushing the enemy back is leading some of the trade to figure upon the demand that can be expected for lumber to be used in rebuilding northern France and Belgium. Operators are already commencing to make the necessary preparations for this business.

Several parcels of Quebec birch planks and boards recently arrived for Robert Cox & Company. Prices are firm and a fair enquiry is reported. Stocks of St. John and Halifax birch planks are light.

There is no change of importance to note from Manchester. Prices are firmer, but very little c.i.f. or f.o.b. business is reported. The freight market shows an upward tendency. At Glasgow, the trade has been quiet of late. Spruce is reported as one of the weak spots, especially in the narrower sizes, of which imports have been heavy. For 9-in. and wider stock, however, prices are steady. The movement of Quebec pine 'ex quay" has been on a fair scale, but most of it is going into store. Birch is quiet both in logs and planks.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Foreign Trade Improving

St. John, N.B., Sept. 21.—(Special to the Canada Lumberman.)—During the last two weeks the market has shown quite an improvement, in so far as foreign and American business is concerned. The allies are again in the market, making purchases of deals, scantlings, and boards, supposedly for trench warfare. Some six to seven million feet have been shipped during the last two weeks from this port. The buyers at St. John claim that the English houses are not coming on the market for any material for home consumption. The stocks of English deals are heavy, and trade none too good; so it is in reality to the allies that sellers here are looking for a market.

A considerable change has taken place in preparing for next winter's portable mill operations. A while ago it was said there would practically be no operating for winter business for 1916-17 as far as portable mills were concerned. Now they claim they can sell at $18 to $19 per M for their cut of deals, and are going in quite heavily. Of course, the cut will be light, as labor is going to be scarce and high in cost, and this, with the high price of food of all kinds, will deter many from doing anything at all.

The usual cut will be planned for on the St. John and tributaries, but how it is going to be pulled from the yards, even if cut, is the serious end of the business. Choppers are asking $35 to $0 per month, Teamsters, etc., are asking high wages, and feed for horses is also extremely high; so the price of logs must, of necessity, be greater in some respects than before. Some localities may not be affected as others.

Locally the trade is quiet. While there is a large amount of repair work, very few large buildings of any kind are being put up throughout this section. All low-grade stocks are hard to move. Spruce boards are firmer than they were, owing to demand abroad.

The market is practically bare of shingles, and will remain so for some time to come, as logs are about sawed out.

Montreal Trade Experiencing a Fair Demand

Montreal, September 25th; (Special to the Canada Lumberman): There is a fair demand for box lumber, especially for birch, but outside of this trade is dull. It is expected that some very large orders for shell boxes will be placed next month. At present the majority of firms holding contracts are behind with their deliveries. Companies making furniture are busy.

Trade has been seriously interfered with by an embargo on C. P. R. terminals and by the scarcity of labor. Great difficulty has occurred in securing cars from various points, this adding to the unfortunate position whereby certain mills are unable to give prompt shipment owing to the labor shortage.

The anticipated short cut has already resulted in prices stiffening generally. Unless there is a radical change, it is certain that quotations will have a substantial rise. In addition to the smaller cut, the serious advance in the cost of provisions and labor will have to be taken into account in fixing values. Besides, the men will probably not be as efficient as before. They will be more independent, and knowing the difficulty of obtaining men may lessen their output. Taking all these factors into consideration, one lumberman expresses the opinion that the cost of getting lumber will be 100 per cent. greater than last year.

The shipments to the United Kingdom continue to be on a small scale. Space is not only limited, due to government demands, but there is a difficulty in obtaining cars. Traffic is congested in Montreal, and there is great delay in securing supplies. Freight rates are almost stationary. Reports from the other side state that the market shows little improvement, and some shippers have, in consequence, refrained from sending lumber. A large order for British Government account has been received.

A keen demand for all the sulphite produced has resulted in prices again advancing. Advices from England state that the market there is very buoyant, with buyers for all that is in sight. Canadian exports to the United States have lately shown a large increase. The Abitibi Power and Paper Company have decided to enlarge their sulphite plant to 125 tons per day and their newsprint mill to 400 tons per day. Ground wood is still an excellent market, while newsprint is in strong request, with prices very stiff.

Better Feeling in Spruce Deal Trade at Liverpool

Alfred Dobell & Co., Liverpool, Eng., report, under date of Sept. 1st, that there is a distinctly better feeling in the spruce deal trade and more inclination to buy, but so far prices obtainable are still so much below cost that several cargoes have been landed on account of shippers. Douglas fir continues to arrive in small quantities, per liners. There has been more enquiry for clear squares in special dimensions; otherwise the demand has been normal. Stocks are very light, and buyers show no disposition to commit themselves for forward delivery.

Liverpool Market Report

Smith & Tyrer, Ltd., Liverpool, Eng., report, under date of Sept. 1st, as follows: Although there has been a little more activity during the past month, buyers have not yet regained confidence in the market, and require some temptation in price to induce them to buy. Hardwoods.—There is only a restricted business. Spruce Deals.—The chief feature has been the number of cargoes yarded by the shippers rather than accept current unprofitable prices. A little better feeling has developed, but there is still a large number of cargoes offering, although the majority consists of cargoes of small volume. Freights have steadied, and are likely to move upward. Hemlock is difficult to place. Birch has shown rather more activity. Pine is firmly held. Pacific Coast Woods.—There is not much doing, owing to the lack of space at reasonable rates.

Barbados Market Reports

S. P. Musson, Son & Company, Bridgetown, Barbados, report under date of September 1st as follows:—Lumberstuffs—White pine—During the past fortnight there have been no arrivals, but the market is fairly well supplied. There is a good enquiry, however, and later shipments will sell to advantage. Spruce—We can recommend shipments, as shingles of good quality are wanted. In cedar laying shingles recent shipments have temporarily filled requirements, but there is sime inquiry for later shipments. Shooks and wood hoops—No receipts.

Canada's Lumber Exports Increasing

Canada's exports of forest products during the twelve months ending June, 1916, and previous years were valued as follows:

1916, $53,259,354; 1915, $43,288,935; 1914, $43,241,666; 1913, $43,518,571.

Details of the exports of wood and manufactures of wood during the twelve months ending June, 1916, and June, 1915, are as follows:

	Twelve months ended June,			
		1916.		
Articles exported.	1915.	Total.	To Un'd K'gd'm.	To U.S.
Logs	$1,059,798	$ 1,079,125	$ 52,084	$ 1,026,701
Lumber—Deals, pine	1,076,276	1,425,522	1,363,445	31,707
Spruce and other	7,131,854	9,534,477	8,497,831	337,606
Laths, palings, and pickets	2,055,498	2,409,535	11,712	2,386,937
Planks and boards	19,196,527	25,086,657	2,230,654	21,196,880
Shingles	3,231,365	3,658,130	.....	3,631,611
Timber, square	489,360	460,499	429,764	30,735
Wood blocks for pulp	6,463,125	6,102,170	.....	6,102,170
Wood pulp	9,257,036	12,220,988	672,673	10,793,647
Wood and manufac. of—Total	$53,289,843	$66,559,366	$15,717,159	$47,082,837

Imports of wood and manufactures of wood into Canada for the twelve months ending June, 1916, and June, 1915, were as follows: From the United States, $8,918,054; from the United Kingdom, $171,650; total, $9,321,197; 1915 total, $11,041,252.

Great Britain Demands More Canadian Wood Pulp

The Use of Cost Figures in Estimating

By Charles Cloukey.

It would seem at first thought that the only correct figuring basis for any factory would be secured by a compilation of cost figures gathered in that factory. And it is a fact that this condition becomes more practical the oftener each kind of work is repeated. Careful comparisons of similar work, taken through the cost accounts, leads me to believe that the use of a single example for a figuring basis is a very risky thing to do, for it is a common occurrence to find quite a wide difference in the cost of similar articles and quantities.

Before taking up some of the reasons why we cannot always use our cost figures in estimating, let us look at a few of the conditions and circumstances which are apt to modify any one example of work put through the mill. In considering the cost of mill work, let us remember that our totals are made up of three principal divisions, each of which is so complex in character that we can very seldom say, "This cost figure is absolutely correct." The three items are labor, material, and overhead expense.

First, considering labor, we find rather a ragged division between labor and overhead, the rule being to charge up to the job all the labor of skilled mechanics, and perhaps the labor of bringing in lumber from the yard and the labor of crating and packing. You will notice that I say "perhaps," for some concerns coming under my personal notice have carried the handling of lumber from the yard and the crating in the overhead.

Another item of dispute is that of billing and detailing. Some concerns will put this work all in the overhead, but this practice is obviously wrong, as we may see by comparing the work of billing out $100 worth of cases and $100 worth of moldings. The billing time on the mouldings should not exceed thirty minutes, while the case work might easily require a whole day to bill and detail.

The reason I call attention to this is that when the billing, detailing and superitendence are carried in the overhead and spread on all work as a percentage, the mouldings will show less profit and the case work more than they have really earned. In other words, the estimator will have to use his judgment here to equalize the error in overhead.

After determining which workmen are to be figured on the productive list, the next and most difficult problem in all cost accounting work is to get correct reports of time charged to the various jobs. This statement is made advisedly, and the extreme difficulty in procuring reliable records of workmen's time has induced more than one factory to change their methods time after time, and some of them to abandon cost-keeping except as a matter of individual tests. This may sound foolish to most factory experts, but after we have shown that the mill's selling price cannot often be determined by its cost sheets, it will appear that only the data known to be correct is of any real value as a guide to pricing or as a spur to better methods of manufacture.

If we want to know how much it costs the odd-work mill to make stock doors in lots of 50 or 100, it is comparatively easy to keep time on this one item and have confidence in its accuracy. We can repeat this item until we have sufficient check, and can say that our cost per door is so-and-so-much, manufactured in convenient lots. We can apply this information to any lot of doors we figure which approximates the circumstances of manufacture already recorded. It is equally easy to determine the cost of sash in different styles and quantities, without burdening the mill with a blanket cost on everything done.

A critic might say that in recording costs on specific items only no record will be made of the waste time which necessarily comes in between jobs, but this can be estimated at one time as well as another. The misleading part of this feature in a general cost system is that an hour of lost time may be accumulated on a job which normally should require but thirty minutes of actual work.

The writer remembers the circumstances of three batches of outside frames going through the mill at the same time, one of which amounted to about $1,500, another about half that much, and the third about $200. When the cost of the three was figured up separately, the first two showed a very satisfactory profit, while the third showed a loss of over $200, or more than the original estimate.

A careful investigation failed to show where the trouble was, but the fact still remains that there was a fair profit on the three jobs, taken together. So we can say with a considerable amount of reason that it would be folly to double the estimate on the small bill of frames, in view of the fact that an analysis of the material and probable time of manufacture was not out of line with the other two jobs.

To sum up the situation of labor cost, I believe that a careful and reliable figure may be obtained on any class of article by taking only representative jobs and keeping cost on them separately; and by separately I mean to take cost data only on one job of a kind at a time. Then repeat enough times during the year to establish an average.

That the estimating of material on a given piece of work has its uncertainties is verified in the fact that the requirements for duplicate work should be the same, but very frequently are not.

Of course, if the practice of figuring from the cutting bills is followed and a level per cent. added for waste, it will be possible to duplicate the cost figures on material in case the market stays even. But if the record is made by the man who brings the lumber in from the yard, duplicate jobs may show quite a wide discrepancy and still be correct.

Let us consider the matter of a large order for trim which will require anywhere from two to six cars of lumber. If there is much work going on in the mill at the same time, using the same kind of lumber, there is sure to be a confusion of charges and credits. Personally, I prefer the percentage addition for waste.

Another chance for error in material costs is the omission of the cost of manufactured articles required, such as glass, hardware, paints, and varnishes, sash pulleys, and the like. Sometimes these items are added in all right, but the item of their freight is overlooked. This is often of considerable importance, as in the case of plate glass. Boxing and crating material is another item to be accounted for, either in the overhead or in each individual job, and it is my opinion that it should be in the latter.

Whether the costs are kept the year round or whether they are worked out as special items as here advocated, the overhead charges will have to be determined in the same manner; and, as intimated in the fore part of this article, the items going to make up overhead charges are more or less uncertain and mixed.

One will find in every mill quite a considerable amount of productive work done by non-productive labor, which is charged to overhead and therefore makes the labor cost too low. This is more apt to occur in small jobs where common labor helps out in times of stress, or in large jobs where the billing and detailing are put into the overhead. In regard to the latter practice, it will appear that if the greater part of a mill's business for a year should be made up of case and fixture work, and the billing, detailing, and superintendence figured in the overhead, the percentage established by that year's business would be too high for a year in which the bulk of the work was straight sash, doors, frames, and trim.

The items of checking, crating, freight, drayage, priming, putty, nails, and any other expense which comes upon a part of the work in considerable amount and upon other parts not at all, give very misleading results when carried in the overhead account.

It would appear that the foregoing has more to do with cost-keeping and its pitfalls than with the pricing of materials to be sold, but it is necessary to know just how much our figures are worth before we tie up to them. Another thing which every estimator knows is, that if the cost of production runs too high and the estimates are made according to the cost sheets, the mill will soon run out of business. If the mill's cost of production is low and the estimates based on the figures, the mill will soon be overstocked with work and will have to raise prices in self-defence.

The annual or semi-annual inventory is the only competent check on any cost system, and then it requires the attention of a careful analyst to place the modifying circumstances where they belong.

The application of cost data to figuring estimates is useful in two ways: First, it gives the mill a decided tendency to show a profit in all its departments. In the second place, it gives a comparison with market quotations, which often enables the special-work mill to buy and sell stock stuff at a profit which it could not make without a loss, and so land the balance of the work which is really profitable.

The writer has found it a most satisfactory practice, in estimating, to take up special methods of work with the superintendent or department foremen when figuring a certain piece of work, and determine upon some short-cut or improved method before making the price. Notes to this effect are placed on the figuring sheets, so that the circumstance may not be forgotten in case the contract is secured. And in this way previous costs may be reduced.

In conclusion, let us not forget that good judgment must be used in connection with all ready-made figures. All cupboards are not worth $5 a running foot K. D., or $7.50 set up. Doors and sash thicker than 1⅜ in. are higher-priced at the same discount. Moldings thicker than ⅞ in. are higher-priced at the same discount, and it is worth more per foot to sand some little panel mould than it is a flat detail of base 9½ in. wide. Are you pricing accordingly, or are you applying the same discount to everything similar that you figure from a list?

If your cost sheets and inventories show that you are not making a decent profit, and your volume of work shows that your prices are about what your competition is forcing you to take, then there should be some reforms in your mill or your mill's management.—The Woodworker, Indianapolis.

At a meeting of the Montreal Chambre de Commerce, on September 21, Mr. L. A. Mongenais outlined a scheme for the establishment of a large wood distillation plant at Lake Labelle, P.Q. The object is to obtain various chemical products, the abundance of our wood supplies affording great opportunities for such an industry.

The bark of black oak, or "yellow oak" as it is often called on account of the color of the inner bark, is now used for dye-making.

Camp Groceries

You can always be sure that we have at all times a good supply of everything that is needed by the cooks in the camp.

Buying in large lots, we can quote the lowest market prices which are prevailing at the time of inquiry.

Sawmill Belting—Its Requisites and Its Care

By B. F. Hall

Of all machinery, sawmill and planing-mill machinery is the hardest to equip satisfactorily with belting.

Master machinists and belt experts can afford to consider themselves well posted on belting equipment when they have learned just what heft and width belts to work in the different places in a sawmill to give the best results.

Too often in building and equipping a sawmill there is very little attention paid to the belting. There are several reasons for this. The belting is, ofttimes, or I might more correctly say nearly always, the last of the equipment bought, and former purchases, for a large sawmill, have been so great, with expenses of building and equipping the mill, in many cases from one and a half to twice as much as was appropriated for it, that this, many times, causes the purchaser to buy cheap belting. He forgets that in doing so he is nearly always buying trouble. If this purchaser would stop and consider the fact that his company has spent thousands of dollars in buying and installing the best machinery, in their opinion, that money would buy, he would see the folly of equipping this expensive machinery and costly installation with cheap belting, knowing the fact that the belting is the very thing that ought to be the best money could buy, because the belting is that most important part of the entire equipment, though nearly always purchased last, that transmits the power and keeps the expensive machinery in operation.

Cheap Belting Does Not Pay.

There is always someone willing to sell belting a little cheaper, but a long and careful study has taught me that cheap belting equipment, to start with, costs too much in the long run. Competition has fairly well regulated the price of belting, and real cheap belting, to start with, has, in all my experience, proved to be the most expensive, in the sawmill in course of time.

To a great extent successful operation of a sawmill depends on the belting. A large operator recently told me that he could not afford to buy a certain belt, although the first cost was very low, because that belt, he said, stretched so much that the time lost and labor cost of taking the excessive stretch out of the belt would several times pay for the belt. I advised him that the best is the cheapest. He bought a good belt, and his trouble at that particular place stopped.

When the cost of fuel is a consideration (which I am glad to say is seldom ever the case at sawmills) the user cannot, from a financial standpoint, afford to use anything but belting for transmission of power. In fact, counting installation, maintenance, efficiency, cost of operation, etc., belting is the cheapest of all ways of transmitting power in a sawmill, and certainly by far the most satisfactory.

Proper Mechanical Conditions.

Regardless of the kind of belting used, whether it is the best or the cheapest grades, or regardless of what material it is constructed, such belting must be operated under proper mechanical conditions if the best results are obtained. When I say "under proper mechanical conditions," of course I eliminate speed. Some belts in sawmills have to be driven at so great a velocity that there are no mechanical authorities who will admit that it is possible to obtain the best results from a belt traveling at so great a velocity. The requirements of belts in sawmills is greater than any other work that belting is made to do.

In referring to different drives, I will only name some of the hardest ones in sawmills, because these are the ones that cause the trouble. As all men who are acquainted with sawmills know, there are some slow and fairly easy drives in sawmills.

High mechanical authorities say that 4,500 feet a minute is the high limit placed on the travel of a double leather belt 22 inches wide and wider, to obtain the best results, considering the life and power received from the belt.

A circular saw with a 24-inch diameter pulley, making 900 revolutions a minute, and driven by a belt, requires the belt to travel 5,618 feet every minute. With the same number of revolutions this belt, traveling over a 30-inch diameter wheel is traveling 7,068 feet every minute. Just think of it—this is faster than the travel of the fastest passenger train on record. I name this to point out the fact that everything must be exactly right if a belt is expected to give even fair results moving at the above mentioned velocity. Such belts are usually worked over crowned pulleys. The crowns on these pulleys should line with each other, as well as the pulleys to be lined with each other. If the crowns on the pulleys do not line, the belt will divide with the crown on the larger diameter wheel and will be out of line on the smaller diameter wheel.

Where an idler is used, it should be a flat-faced pulley, because a crowned idler will lead the belt to one extreme or the other, and if the crowns on the drive and driven wheels do not line with the crown in the idler—if a crowned idler is used—it works a hardship on the belt.

The underneath side of a belt should be the pulling side and the top side the slack side. If an idler is used on a belt it should run on the belt fairly close to the driven wheel, and, of course, on the top side of the slack side of the belt.

Driven wheels are usually the smaller in diameter, and the belt does not wrap the driven wheel, when the driver is a larger wheel, as much as it does the larger wheel.

By placing the idler, as above described, it will help to wrap the belt around the smaller diameter wheel, and by so doing the belt will give up more power. However, care and judgment must be exercised to not get the idler too close to the wheel receiving the power, for if it is, it will cause the belt to make an unnecessary short, sudden turn, which is liable to damage the belt.

It is a mistake to use short belts, at any place in a sawmill, where it is possible to avoid the use of short ones. This is sometimes done because a long belt costs more than a short one of the same heft and ply. However, it is a waste of money to use short belts when possible to use long ones, because a belt 60 feet long, traveling 5,000 or 6,000 feet a minute, will wear longer than two belts each 30 feet, the same width and ply, doing the same work and traveling at the same velocity as the belt 60 feet long.

Belts Require Elasticity.

Belts require elasticity. When they do not give some they break, and when they have no elasticity they will not give up as much power as when they stretch a little. Experience has taught me that it is not the best plan to buy a belt that is stretched, by the manufacturer of it, to such an extent that when the belt is put in service it does not stretch enough that the slack has to be taken out of it. This is especially true where long belts, over small diameter wheels, are used. When a belt does not have to be shortened, after hard service, it indicates that the manufacturer of the belt has stretched the material the belt is made of to such an extent that he has separated the fibres in that material so much that the work does not affect it further. The belt has no elasticity, consequently it does not transmit the power, neither does it last as long as it would if slightly elastic.

Belts transmit more power and last longer when they are not too tight—just tight enough so they will not slip under their maximum load is better than to have the belt as tight as it can possibly be made.

There are only a few things that cause belts to slip. When they are wet, greasy, and dirty, too slack, or overloaded they will slip. These conditions can be remedied.

Machine oils and greases for machinery rot any belting, for these oils and greases are of a mineral substance, and any mineral oils or greases will rot any belting. They can be and should be kept off of all kinds of belting, except iron chain belting.

Rubber, leather, and other belting lasts from 25 to 125 per cent longer if mineral oils and greases are kept off of them.

When a belt is slack enough that it slips it should be made shorter. This is not a big job, and frequently saves the loss of a good belt, because when belts, of any make, slip on the pulleys, this burns the belt and causes it to break. When a belt is overloaded it has the same effect, in burning the belt, as when it is too slack, except when the belt that is overloaded is kept too tight, to prevent it from slipping, that the very life is pulled out of the belt because it is worked so tight to try to compel too narrow a belt to do a wider belt's work. Besides this, too tight a belt is very hard on shafting and hangers. This can be and should be remedied by using pulleys with faces sufficiently wide and belts wide enough to furnish sufficient power to do the work without slipping. There is a right and wrong way, and users should not expect an 8-inch or 10-inch belt to do a 14-inch or 18-inch belt's work, as is frequently done. However, when belts travel at high speed great care has to be exercised that the belts are not too wide. When belts travel slow—say, up to 2,000 feet a minute—it does not differ so much as to their width so they are wide enough that they will do the work, but when the velocity of a belt is very high the belt can easily be too wide for the work required of it.

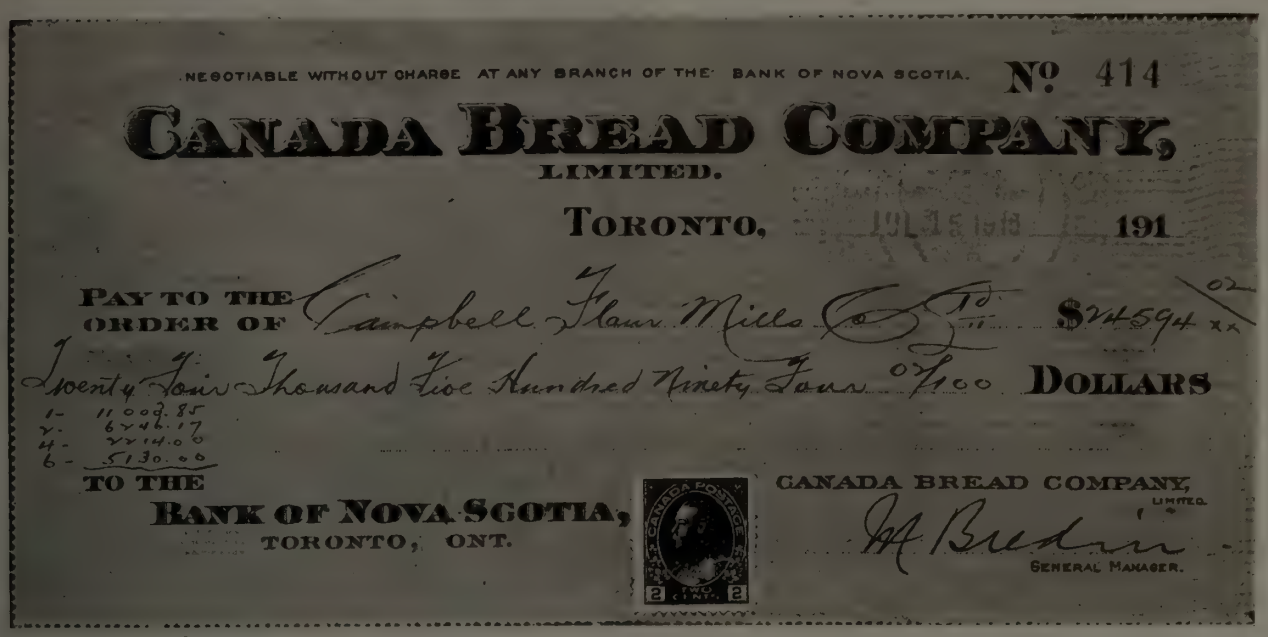
Relation of Velocity to Power.

The faster a belt travels the more power that belt will transmit. Due to increased speed of subsidiary belts, the combined power of these subsidiary belts frequently give up more power than the one or more belts from the engine or engines to the line shaft, although the engine belts have to start and keep going all the subsidiary belts. This is caused from the fact that the velocity of the engine belt, or belts, is not near so great as that of some subsidiary belts. The power increases directly in proportion to the increased velocity of the belt. Frequently this is not considered, and such belts as circular saw and edger belts, that nearly always work under high speed, are, I believe, more often too wide than times that they are not wide enough.

The real power that a belt will transmit is determined by the length, width, velocity of the belt and the diameter and relative diameters of the wheels that the belt travels around. Using the old conservative rule for figuring horse power of leather belting, which, due to the irregular load on sawmill belts is, I believe, the best rule. A good double-ply leather belt 20-inch wide, traveling 5,618 feet per minute, is capable of transmitting 272 horse power, and a belt the same heft and width, traveling 7,608 feet per minute, will transmit 342 horse power.

Cream of the West Flour

A HARD WHEAT FLOUR THAT IS GUARANTEED FOR BREAD



HERE'S PROOF of the baking merits of Cream of the West Flour, from Canada's largest bakers. This cheque was in payment of one month's supply.

Jenckes Boilers

We make a Specialty of

Horizontal Tubular Boilers

for Saw Mill work. They are made in an extensive plant built and equipped for the purpose with all modern appliances.

The three prime elements of Design, Material and Workmanship receive equal and most painstaking attention, ensuring a boiler warranted to give perfect satisfaction and long service.

The Jenckes Machine Co., Limited

Sherbrooke Montreal Cobalt So. Porcupine St. Catharines Toronto Vancouver Nelson

Belts too wide for the work required of them nearly always show it, when the belts are at work, by the edges of the belt riding up off the face of the pulley. I have seen belts ride up 5/8-inch on both edges off on the face of the pulley. When this is the case the belt is transmitting more power than the machine requires, and a narrow belt should be used. Belts giving up more power than the maximum amount of power required to do the work do not last as long as belts that are not overloaded, but that only develop the amount of power required to do the work when working under heaviest load.

Very frequently belts are said to be defective and condemned just because they are too narrow or too wide, and more frequently because they are too wide to do the work required of them.

The life of circular saw, edger, gang edger and other high speed belts is short, due to the speed they travel. However, the life of these belts can be lengthened and money in the long run saved if the operator will use long, instead of short, belts.

Band saw belts last longer than circular saw belts because they work over larger diameter wheels and do not travel nearly as fast as circular saw belts. Three years ago a friend of mine asked me to go over his two sawmills and advise him what width and heft belts to use to get best results. In doing so I found three belts that ought to have been wider than he was using, and eight belts that were too wide for the work they were doing. In replacing these belts he changed the widths, and has had no further trouble.

When single-ply leather belts are used the grain side should run to the pulley and the points of the laps should travel with the wind. Double or triple-ply leather belts are so constructed that the user has to run the grain side to the pulley, but care should be exercised that the points of the laps should not travel against the wind. The idea that the flesh side of a single-ply leather belt is less liable to slip than the grain side is all a fake.

Smooth Surface Next Pulley.

The smoothest solid surface of a belt against smooth-faced cast iron pulley is harder to make slip than if one has a rough surface. Avoid using a wide single-ply belt, because if the belt is traveling even at a moderate rate of speed and has a normal load on it, wide single-ply belting is very liable to become wavy on the edges. Nearly always this is not the fault of the belt, but it is because the user is trying to make too light a ply belt do the work where a heavier ply should be used.

Drive belts, from engines to line shafts, are frequently not wide enough or heavy enough. These belts do not travel so fast, and usually go around larger diameter pulleys than the higher speed belts in sawmills.

Hog belts in sawmills are not so troublesome if they are long belts of the right width and heft, otherwise they are troublesome.

Circular saw belts, edger belts, gang edger belts, gang saw belts, hog belts, and all such hard places are the most important belts in a sawmill, and will give very little trouble if long instead of short belts of the right width and heft are used.

It pays well to get someone who knows to advise in reference to the width and heft of belts to be used on the different machines.

Before belts are fastened together around the pulleys they should be made perfectly square at the ends. If they are not square at the ends, when the ends are butted against each other to be fastened, this itself will make a crook in the belt.

There are a number of ways to fasten belts—some good and some very poor ways. Some belt hooks are better than others, but, as a whole, I consider them a poor fastening. They are stiff and clumsy, and will eventually cause any belt to break where the hooks are driven in. Wire lace is very good for new small belts if put in properly, but not very good for old belts. Where belts are not made endless, a good lace leather is about the best of all other fastenings. However, it is a mistaken idea that a very large string has to be used. Use a small string, and punch small holes in the belt just large enough for this string to be pulled through. Do not punch the holes too far from the ends of the belt. I prefer a hinge joint, because it gives readily as the belt goes around the pulleys, and is not so clumsy as some other ways of lacing.

Belts work better, last longer, run more smoothly, give less trouble, and transmit more power if made endless.

Care in Joining Belts.

Regardless of what method of fastening is used, great care should be exercised in joining belts, because if they are not square at the ends and if the edges are not kept even the belt is forced to not work well.

If lace leather is used and the lace is stretched more on one edge of the belt than it is on the other edge this will let the belt separate more at one edge than the other, and will make a crooked place where joined together.

All belts should be slightly narrower than the faces of the pulleys that they travel over.

The belting should be put in care of one man. If it requires more than one man to do the belt work, divide the work so that each man will have a certain portion of the belting to be responsible for. If it does not require one man's time, then give him all the belting, with certain other work.

Do not use resin, soap, lime, ashes, etc., to stop a belt from slipping, because any of these things will ruin the belt. Keep the belts in good shape and at the right tension and use the right width and heft, then they will give you service.

When leather belts are used they should be oiled when they begin to get dry with a slight application of a good animal grease, to keep them pliable and in condition so they will not crack. When pliable they will hug the pulleys and transmit more power, doing more nearly their full duty and will last longer.—Southern Lumberman.

Bill Nye at Bootjack Lumber Camp

I have just returned from a little impromptu farewell tour in the lumber camps toward Lake Superior. It was my idea to wade around in the snow for a few weeks and swallow baked beans and ozone on the half shell. The affair was a success. I put up at Bootjack Camp on the raging Willow River, where the gay-plumaged chipmunk and the spruce gum have their home.

Winter in the pine woods is fraught with fun and frolic. It is more fraught with fatigue than funds, however. This winter a man in the Michigan and Wisconsin lumber camps could arise at 4.30 a.m., eat a patent pail full of dried apples soaked with Young Hyson and sweetened with Persian glucose, go out to the timber with a lantern, hew down the giants of the forest, with the snow up to the pit of his stomach, till the gray owl in the gathering gloom whooped and hooted in derision, and all for $12 per month and stewed prunes.

I did not try to accumulate wealth while I was in camp. I just allowed others to enter into the mad rush and wrench a fortune from the hand of fate while I studied human nature and the cook. I had a good many pleasant days there, too. I read such literary works as I could find around the camp and smoked the royal Havana smoking tobacco of the cookee. Those who have not lumbered much do not know much of true joy and sylvan smoking tobacco.

They are not using a very good grade of the weed in the lumber regions this winter. When I say lumber regions I do not refer entirely to the circumstances of a weak back. (Monkey-wrench, oil can, and screwdriver sent with this joke, also rules for working it in all kinds of goods.) The tobacco used by the pine choppers of the northern forest is called the Scandihoovia. I do not know why they call it that, unless it is because you can smoke it in Wisconsin and smell it in Scandihoovia.

When night came we would gather around the blazing fire and talk over old times and smoke this tobacco. I smoked it till last week, when I bought a new mouth and resolved to lead a different life.

I shall never forget the evenings we spent together in that big shack in the heart of the forest. They are graven on my memory where time's effacing fingers can not money with them. We would most always converse. The crew talked the Norwegian language, and I am using the English language mostly this winter. So each enjoyed himself in his own quiet way. This seemed to throw the Norwegians a good deal together. The Scandinavians soon learn our ways and our language, but prior to that they are quite clannish.

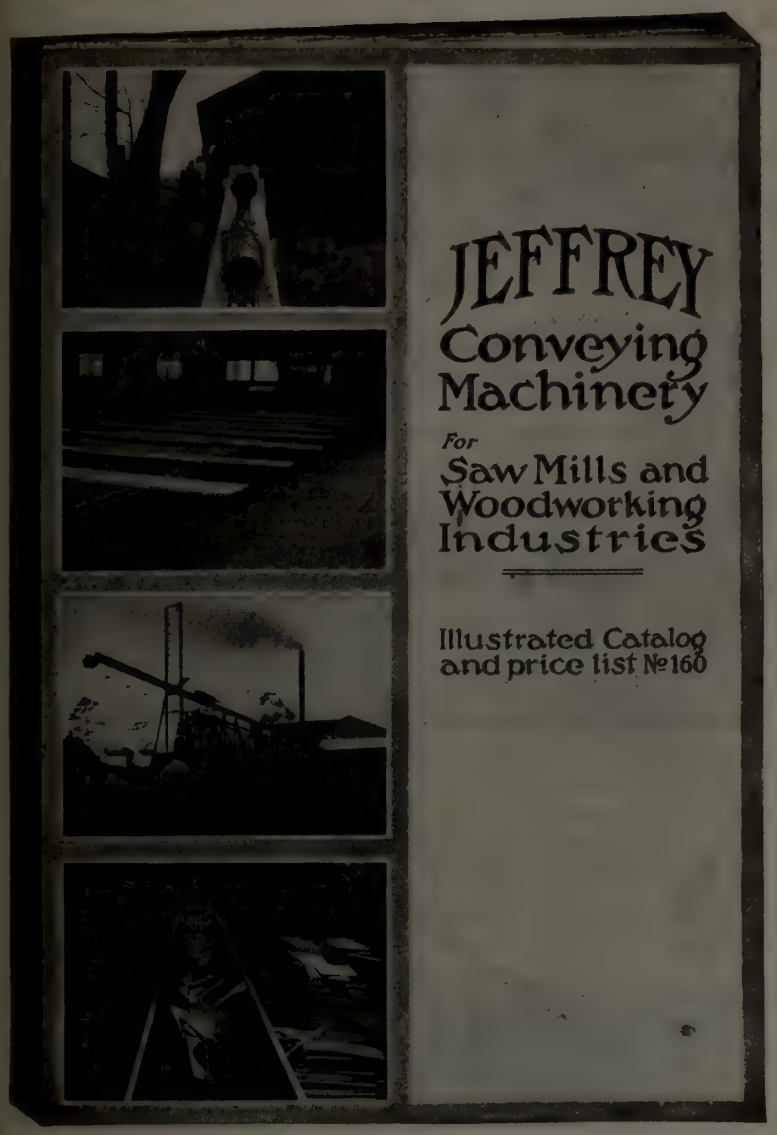
The cook, however, was an Ohio man. He spoke the Sandusky dialect with rich, nut brown flavor that did me much good, so that after I talked with the crew a few hours in English, and received their harsh, corduroy replies in Norske, I gladly fled to the cook shanty. There I could rapidly change to the smoothly flowing sentences peculiar to the Ohio tongue, and while I ate the common twisted doughnut of commerce, we would talk on and on of the pleasant days we had spent in our native land. I don't know how many hours I have thus spent, bringing the glad light into the eye of the cook.

I talked to him of his old home till the tears would unbidden start, as he rolled out the dough with a common Budweiser beer bottle, and poured the scalding tears into the flour barrel. Tears are always unavailing, but sometimes I think they are more so when they are shed into a barrel of flour. He was an easy weeper. He would shed tears on the slightest provocation, or anything else. Once I told him something so touchful that his eyes were blinded with tears for the nonce. Then I took a pie, and stole away so that he could be alone with his sorrow.

He used to grind the coffee at 2 a.m. The coffee mill was nailed up against a partition on the opposite side from my bed. That is one reason I did not stay any longer at the camp. It takes about an hour to grind coffee enough for thirty men, and as my ear was generally against the pine boards when the cook began, it ruffled my slumbers and made me a morose man.

We had three men at the camp who snored. If they had snored in my own language I could have endured it, but it was entirely unintelligible to me as it was. Still, it wasn't bad either. They snored on different keys, and still there was harmony in it—a kind of chime of imported snore as it were. I used to lie and listen to it for hours. Then the cook would begin his coffee-mill overture and I would arise.

When I got home I slept from Monday morning till Washington's birthday without food or water.—From "Bill Nye's Red Book.



Use This Book as Your Guide in Preparing Plans for Future Work

THE JEFFREY CATALOG NO. 160

contains 144 pages of Illustrations, Data and Price-lists—all of value to every Manager, Superintendent and Buyer in Saw Mills and Woodworking Industries—as well as the man responsible for the operation of your machinery.

Your attention is particularly called to the following Machinery, especially adapted for your line of work:

CONVEYORS—which have quickly paid for themselves in the economical and satisfactory handling of all kinds of materials in and about the mill.
Log Haul-Ups from river and storage pile to the mill saws.
Refuse and Saw Dust Conveyers—from mill to fire pit.
Lumber Carriers—from mill to yard or kiln.

CHAINS—A splendid assortment of malleable, forged, steel bar and manganese chains,—all of which have given excellent service in your industry.

POWER TRANSMISSION MACHINERY—consisting of all kinds of bearings, shafting, pulleys, rough and cut gearings, manila and wire rope drives—for small installations and complete plants.

ELECTRIC HAULAGE LOCOMOTIVES AND TRUCKS—for logs and lumber.

The very outfit to meet your conditions for reducing operating expenses and increasing your output is no doubt pictured in this book, sent free upon receipt of coupon properly filled out.

The Jeffrey Manufacturing Company, Power Building, Montreal.

Creosoted Wood Block Paving

By Walter Buehler.

Creosoted wood block pavement properly laid is, without question, the most durable, serviceable, and comfortable pavement in existence. Anyone riding over block streets cannot deny this.

Its durability, its effectiveness, under heavy traffic, needs no further demonstration than the streets in Lower Manhattan or the Loop District in Chicago.

Its comfort and desirability are amply demonstrated by the miles of beautiful residence streets in such cities as Detroit, Minneapolis, and hundreds of others. Minneapolis alone has over 70 miles of block streets, some of these 14 years old, and this year they are laying over 375,000 square yards. Detroit, with many miles of block pavement and years of experience, is laying over 200,000 square yards this year. When the public have used a great quantity of a material over a long period of years and continue to demand it, that material has surely stood the acid test.

Proper methods of treatment are now most generally understood. The important points to consider are: Timber for treatment should not be too well seasoned; the oil should be forced in under slowly increasing pressure to assure a good uniform penetration. All responsible timber-preserving companies can be relied upon to treat the blocks properly.

Much has been said and written as to the proper quantity of oil to be used. There are two principal considerations—first, quantity necessary to prevent decay; second, quantity necessary to prevent absorption of water and thereby help control expansion. Two and one-half gallons of oil per tie in the treatment of a railroad tie has been found to be ample to prevent decay. This is about 10 pounds of oil per cubic foot of timber. Therefore, taking into consideration the better conditions under which a paving block is laid, better drainage, etc., it should require less oil to preserve it than to preserve a railroad tie. For example: The blocks in Indianapolis which absorbed only 6 pounds per cubic foot, are, after 20 years of service, perfectly preserved.

The second consideration—that is, the amount of oil necessary to prevent absorption of water—presents a different problem. Theoretically, we would assume that the greater quantity of oil used the less space for water, therefore the more waterproof. This assumption would be correct provided the cell spaces in the wood had anything to do with the expansion and contraction of the wood. It is a well known fact of timber physics that if the water is evaporated from a saturated stick no change in size takes place until all of the water is out of the cell structure and begins to come out of the wood fibre itself. That is, as expressed scientifically, the point of fibre saturation is reached; therefore, a large quantity of oil in the cell structure does no especial good, but, on the contrary, acts as a reserve supply to prolong the period of bleeding. It is also a fact, I believe, that the preservation does not penetrate the fibre, but only the cell structure. Therefore, the value of the preservative relative to expansion and contraction is dpendent upon its ability to penetrate the cell structure of the wood and paint the fibre structure with a layer of oil, which will either keep the water in the fibre and the block expanded to its normal size or keep the water out of the fibre of a thoroughly seasoned block.

As a paving block has six sides, on all of which the fibres are exposed, a certain amount of surface evaporation or absorption takes place. This accounts for the trouble with blocks treated with 20 pounds of heavy oil, which expand with the first rainstorm after they have been laid, when the blocks have been allowed to lie along the street for a long period before laying, or where thoroughly air-seasoned timber was used in the manufacture of the blocks. The quantity of oil alone will not prevent contraction or expansion. Other factors must be taken into consideration—that is, methods of treating and laying. A sufficient quantity of oil should be used to thoroughly treat the blocks, the quantity varying with the quality. That is, I firmly believe that an average of 16 pounds of an oil with a gravity of 1.08 to 1.12 is sufficient.

No other one feature of the creosote block pavement has been so much discussed as the quality of the oil to be used. In the early days very light gravity oils were used. These early pavements caused considerable trouble, due to expansion and contraction. The quality and quantity of oil were blamed for this trouble, and each year found the manufacturer advocating higher and higher gravity oils, and greater and greater quantities. This reached its climax about 1913, when the standard specificaions adopted by the Association for Standardizing Paving Specifications called for an oil of not less than 1.14 gravity at 68 degrees F., and 16 to 22 pounds of oil per cubic foot. In order to obtain this high gravity oil it was found necessary by many manufacturers to use mixtures of distilled oil and tars. We soon began to have trouble, due to bleeding of the block pavements, and, in addition, the expansion trouble was not entirely cured. As a natural consequence, a reaction took place, and, as is generally the case, the pendulum swung to the other extreme.

It is my personal opinion that, within certain limits, it makes very little difference what the quality of the oil is, provided that you have a staple oil and the blocks in proper condition for treatment, thoroughly penetrated with it, and then laid properly under the right conditions and a reasonable amount of attention given the finished pavement during its life.

Lubrication and Casings for Silent Chain Drives

The Link-Belt Company, Chicago, Ill, have published a bulletin (No. 286) on lubrication and casings for silent chain drives. The bulletin expresses briefly and clearly the advantages secured by the use of a casting which holds oil, through which the chain dips or runs. This is a simple and easy method of lubrication, and requires very little attention. Casings with link-belt oil-proof, dust-proof seals permit the use of silent chain drives where it would not be advisable to employ them otherwise. Many link-belt silent chain drives so equipped are being run successfully to-day in cement mills. The bulletin contains a number of excellent illustrations, clearly explaining the important details of construction and operation in connection with these casings. The company states that from prime mover to machine or from lineshaft to countershaft, wherever it is desired to transmit power without slip or loss, this method is most efficient, showing 98.2 per cent. efficiency on actual test. The Canadian Link-Belt Company, Ltd., 1189 King Street West, Toronto, handle these goods, and will be pleased to furnish full information regarding them or regarding any others of their well-known line.

Important to Pulp and Paper Manufacturers

The selling rights for Canada of the Record improved quick opening gate valve, with patent clean-outs, have been secured by the Canadian Pulp Mill Machinery Company, Limited, 18 Tansley Street, Montreal. The same company have obtained contracts for the supply of the P. and M. rotary diaphragm screen to the following: St. Maurice Paper Company, Bathurst Lumber Company, and Brompton Pulp and Paper Company. An order for grinders has been secured from the Donnaconna Paper Company.

Miscellaneous Items of Interest to Lumbermen

One ton of coniferous wood waste will produce from 15 to 25 gallons of 190-proof alcohol.

The farm woodlots of the United States contain about 10 per cent. of the total standing timber in the country.

Mr. A. E. Clark, of Edward Clark & Son, wholesale lumber dealers, Stair Building, Toronto, has been reappointed a member of the Inspection Rules Committee of the National Hardwood Lumber Association for the current year.

The Ha Ha Bay Sulphite Company and the Ouiatchouan Falls Paper Company have given orders to the Canadian Boomer and Boschert Company, Tansley Street, Montreal, for hydraulic pumps, presses, balers, and accumulators.

The stand of timber on the two great national forests in Alaska is estimated by the Forest Service as over seventy billion board feet, while the annual growth will, it is said, produce of pulpwood alone enough for the manufacture of three thousand tons of wood pulp a day.

Capt. W. A. Grafftey, who is in hospital at Boulogne, France, suffering from a slight gunshot wound in the thigh, is the youngest son of Alderman W. K. Grafftey, managing director of the Montreal Lumber Company. Another son is a sub-lieutenant in the Canadian Motor Boat Patrol Service.

Dr. James White, vice-chairman of the Canadian Commission of Conservation, states that when the report of the commission is made it will have some surprising information for people who think the standing timber resources of British Columbia are much larger than they actually are. He says the conditions regarding the forests may not be alarming, but the amount of timber is much less than what has been realized.

Reports from Bangor, Me., state that lumber operators in eastern and northern Maine are finding a great scarcity of woodsmen for woods operations during the coming winter. Wages are running from $35 to $40 per month and keep. Practically no men are offering from the Maritime Provinces, which was once the best source of labor supply for that district. It is expected that the output this year will be as large as last year, in spite of the labor shortage.

It is officially announced from Ottawa that the British Board of Trade will not strictly enforce the Merchants' Shipping Act against owners of vessels or masters of ships arriving between October 31 and November 15, between March 30 and April 16, 1917, with cargoes of light or heavy wood goods carried upon the decks of ships. While the needs of Great Britain have caused these concessions it is announced that masters and ownrs still must insure safe and proper loadings under the same shipping act.

LEVIATHAN OR ANACONDA

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

The Houpt Paper Mills Ltd., Camden East, Ont., have obtained a charter.

The R. Laidlaw Company, Limited, Sarnia, Ont., recently suffered a loss by fire.

Fire completely destroyed the sawmill at Calabogie, Ont., belonging to James Dempsey, Stewart Street, Renfrew, Ont.

A small fire broke out recently at the planing mill of W. Williamson, Toronto. The loss was covered by insurance.

The sawmill belonging to Gordon Staley, Glencolin, Ont., was recently destroyed by fire. The loss is estimated at $2,800, and the plant will be rebuilt.

The Bishop Lumber Company, Limited, has been incorporated with head office at Nesterville, Ont., and capital stock of $200,000, the provisional directors being H. H. Bishop, H. W. Bishop and J. A. Bishop.

The Waupaca Company, Limited, has been incorporated with head office at Port Arthur, Ont., and capital stock of $100,000, the provisional directors being H. Keefer, G. A. McTeigue, J. A. Duffy, A. G. Cowan, and H. E. McKay. The objects of the company include owning and operating timber limits, dealing in timber and lumber, operating sawmills, pulp mills, etc.

The Abitibi Power and Paper Company, Iroquois Falls, Ont., who suffered considerable inconvenience in connection with their operations as the result of the great forest fires this summer are again operating at full capacity. It is reported that the company will increase the capacity of its paper plant to 400 tons per day and that of the suliphite plant to 125 tons per day.

The Armstrongs, late of New York, have bought out the Mattagami Pulp & Paper Company, which has been engaged for some months in putting up a new sulphite plant at Smooth Rock Falls, Ontario. All the interests of the company, including large timber limits, have passed to the Armstrongs, and the company's officials have been replaced by men selected by the new owners. S. R. Armstrong has already taken up the duties of manager.

Eastern Canada

A. P. Beaupre & Company, sash and door manufacturers, Montreal, P.Q., have been registered. Those interested are Arthur P. Beaupre and Mrs. Francis Paul.

The Bathurst Lumber Company, Limited, of Bathurst, N.B., has applied to the Dominion Government for permission to build wharves at its mills on the Nepisiguit River, in part of the public harbor at Bathurst.

Stetson, Cutler & Company's sawmill at Indiantown, St. John, N. B., started operations again on September 16th, after being closed down since July 29th. The mill had been idle on account of scarcity of tonnage and congestion of stock in the yards.

William R. Patterson, Windsor, N.S., who lost his sawmill by fire about a year ago and had commenced the construction of a new mill, has again had the misfortune to suffer in a similar manner. On September 15 the new mill, which was in the course of erection, was destroyed by fire, together with some 5,000 feet of new lumber. There was no insurance.

Le Parc des Allies Limitee is the name of a new firm which has been incorporated with head office at Quebec, P.Q., and capital stock of $20,000, to carry on business as operators of timber limits, sawmills, pulp mills, etc. Those interested in the new company are A. G. Verret, F. E. Fortin, V. R. Lamontagne, A. Pouliot, E. Turgeon, V. Marcoux, and J. A. Bolduc, all of the city of Quebec.

An organization has been formed by paper men at Montreal for the purpose of handling the export business of Canadian paper mills. Incorporated under the name of the Canadian Export Paper Company, Limited, with a capital stock of $500,000, the organization has secured wide powers. It will be composed of the leading members of the Canadian Pulp & Paper Association, and the ultimate object is to bring the marketing of Canada's surplus products of pulp and paper under a single selling organization of a powerful and aggressive character. This will apply purely to the export business, and the idea is not to boost prices but to put the selling end of the business on a scientific basis, with a view to the greatest possible development along national lines. Already a subsidiary organizaztion of the Pulp & Paper Association is hard at work studying the technical end of the business with a view to improving on the already high standard in the manufacturing processes, and the selling end will now come in for the same scientific organization.

Western Canada

The Eagle Lumber Company, Limited, has been incorporated with head office at Killam, Alta., and capital stock of $20,000.

The Farmers Mutual Lumber Company, Limited, has been incorporated with head office at Irma, Alta. The capital stock is $20,000.

A shingle mill is being erected at Arrowhead, B.C., by Ralph Simpson.

The building will be two storeys, 32 x 60, and three shingle weaving machines are to be installed.

The New Ladysmith Lumber Company, Nanaimo, B.C., has acquired 2,500 acres of timber adjoining its holdings at East Wellington.

H. M. Ellis, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $50,600, to carry on business as lumber and timber merchants, sawmill, pulpmill and shingle mill owners.

The Dominion Shingle & Cedar Company, Limited, has been incorporated with head office at New Westminster, B.C., and capital stock of $45,000, to carry on business as lumber and timber merchants, loggers, shingle mill, planing mill and sawmill proprietors, etc.

The B. C. Trading and Transportation Company, Limited, has been incorporated with head office at Kamloops, B.C., and capital stock of $100,000, to carry on business as manufacturers and dealers in timber, lumber and logs and to operate sawmills, planing mills, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 25th day of October, 1916, for the purchase of Pulp License X234, to cut 1,423,546 feet of Douglas fir and hemlock on an area adjoining Lot 2351, Mill Creek, New Westminster District.

The Colonial Pulp and Paper Mills, Limited, in which Mr. Geo. F. Whalen, Vancouver, and a number of his associates have acquired the controlling interest, are going ahead with the erection of a large plant at Quatsino Sound, B.C. The first unit will have a capacity of 60 tons of sulphite fibre per day.

Sealed tenders are being received by the Minister of Lands for British Columbia, until the 9th day of October, 1916, for the purchase of License X659, to cut 1,024,000 feet of fir, cedar, and hemlock and 5,120 lineal feet of poles on an area adjoining S. T. L. 1484P, Ramsay Arm, Range 1, Coast District. One year will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 11th day of October, 1916, for the purchase of License X703, to cut 10,066,000 feet of Douglas fir, cedar, larch, yellow pine, white pine, cotton-wood and dead and down timber; also 14,000 cedar poles and 86,000 railway ties, covering that portion of Lot 274, Kootenay District, situated south of the Goat River. Two years will be allowed for the removal of the timber.

Mr. Geo. F. Whalen, of Vancouver, B.C., and a number of his associates, have organized the Empire Pulp and Paper Mills, Limited, with a capital of $2,500,000, and will take over the old Swanson Bay Properties, where a pulp mill was installed a few years ago, but was only operated for a short time. The plant is now being overhauled and will be brought up to a capacity of 30 tons of sulphite fibre daily. The company will also carry on at Swanson Bay the manufacture of high grade spruce lumber.

Canadian Exports to Cuba

Canadian exports to Cuba during 1915 and 1914 included the following:

	Value, 1914.	Value, 1915.	Increase, 1915.	Decrease, 1915.
Wood pulp and newsprint	11,922	7,264	.....	4,658
Lumber	276,195	146,356	.....	129,839
Box shooks	3,486	4,950	1,464	.....
Barrels	14,715	13,392	.....	1,323

The total imports into Cuba from Canada during 1915 were valued at $1,123,336.

Offshore charter rates continue to soar, latest quotations being as follows: From Puget Sound or B. C. ports to Sydney, 125s.; to Melbourne, 137s. 6d. to 140s.; to Fremantle, 150s. to 160s.; to Iquique, 120s. to 125s.; to Valparaiso, for orders, 122s. 6d. to 125s. (2s. 6d. less direct); to South Africa, 250s.; to United Kingdom, direct port, 270c. to 275s.; Puget Sound or Columbia River to San Francisco, about $5.50; to Southern California ports, $6.50 to $7.00. There is an insufficient supply of steam schooners to handle the California business offering.

At a meeting of Washington lumbermen and State bankers, held at Seattle, "The Small Sawmill" was the topic discussed by C. L. Clemans, of the Nippon Lumber Company, Alpine, Wash. In the course of his remarks Mr. Clemans said: "In my opinion the great trouble with the lumber business during recent years may be laid to the ambition of some of my friends in the business who have endeavored to steadily increase their operations and have developed such great capacities that they have in many instances felt themselves compelled to bear the market to move their product." The same view has often been expressed in British Columbia. It is possible to point to various small mills that have made considerable money year after year, but some at least of the big concerns wear out their machinery in an endeavor to get back the first cost of the plant and equipment.

We Scan Every Board

before we permit it to go from here. It must be first class in every way or it doesn't go except for rough work. If you are building anything worth while build it right. And the first step is to get the best lumber, such as we sell exclusively.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

"LIDGERWOOD" PORTABLE HIGH SPAR SKIDDERS

OPERATING OVER

LONGEST SINGLE SPAN

IN THE WORLD

Skidding Logs over 3800 feet

"Lidgerwood" Cableway Skidders have two exclusive and patented features and these are essential to the success of this style of lumbering.

1.—"Lidgerwood" Cableway Skidders have a mechanical slack puller. The buggy is held stationary while the mechanical slack puller pays out all slack required in the skidding line to reach logs lying at a distance each side of skidder.

2.—"Lidgerwood" Cableway Skidders have a two speed device on the engine which returns the buggy to the woods at high speed.

We have paid special attention to the construction of Cableway Skidders required by conditions in British Columbia and the most successful machines now in use in that province were installed by us.

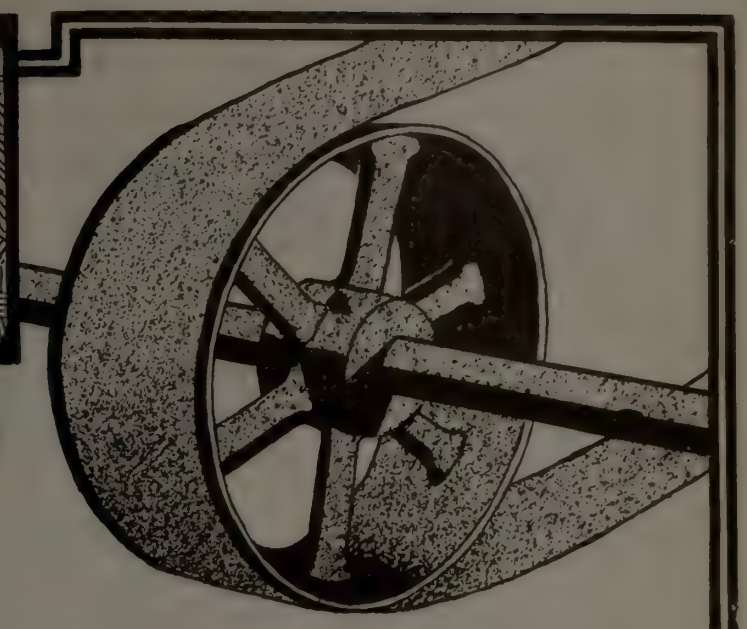
When You Overhaul Install

GOODHUE BELTS



"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Saving $100,000.00 Yearly on Coal Bills

Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

That may sound fabulous but it is a fact established by the Minnesota & Ontario Power Company. Before the installations of Jones Underfeed Stokers 695 tons of coal at $3.50 per ton were the daily requirement. With the Jones Stokers and Dutch Ovens, as illustrated, the mill waste was utilized and only 5 tons of coal were burned each week.

This is only one example of many showing the immense saving n fuel bills effected by Jones Stokers.

We will be pleased to correspond with you regarding the use of Jones Stokers in your plant. Write us.

When You Buy an Hour GET an Hour

You can do it with an International

How long would you do without scales in your yard if you only got 1900 lbs. every time you paid for a ton?

Yet your greatest investment—minutes—is the one item that is bought without full measure.

An INTERNATIONAL TIME RECORDER will insure your minutes. It will help you get all you order and see that you only pay for what you get. It will enable each employee to make up his own pay roll and reprimand himself when he is late. It is honest, accurate, impartial and always on the job.

A proper time recorder to suit your needs will give you the best insurance in the world against lost minutes.

Sturtevant Common Sense Moist Air Progressive Dry Kiln.

If you install a

Sturtevant

Trade Mark

Common Sense Dry Kiln

you will have taken the first step toward cheaper drying and more uniform results. The mysterious valves and dampers which require the close attention of an expert to successfully operate are conspicuous by their absence.

Sturtevant Kilns are built with a thorough understanding of the requirements of the average plant, and are so simple that the average attendant can operate them with good results.

Why not get in touch with our experts on lumber drying — or send for Catalogue No. 220-C.

B. F. Sturtevant Company of Canada Limited

Works: GALT, ONTARIO

Montreal Toronto Winnipeg Vancouver

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

FIRE BRICK

Each brand is specially suited to a separate use. We have the experience to manufacture and supply the finest grade of Fire Brick for the varying uses of the Lumber Industry. The same brick may not meet the requirements of your Dutch Oven and of your Refuse Burner.

This is a product that should have your most careful attention. When so much depends directly on the successful operation and dependability of Fire Brick in your plant, it will repay you many times to make a most careful investigation before the installation. Let us show you where our product has been successfully used for years. Let us suggest a special brand for your particular purpose.

We have an interesting catalogue that will be sent you. It will give you an insight into the proper methods of Fire Brick construction.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

"I'll Remember that Name
'SPARTAN'

"The trade mark says 'Spartan.' I suppose it was named after those old Spartans—the fellows who could stand 'most everything.

"This belt was on the machine when I started in nere three years ago and it has certainly stood some hard service. Doesn't slip, stretch or glaze. Guess the boss knew what he was doing when he picked this belt—why, it's good for years yet. I'll keep that G & K Spartan trade mark in mind—I may be able to use the information some day."

The operator is pretty close to the belt. He appreciates a good one because he is often the loser from a poor one. Any Graton & Knight belt makes good because it is made from selected hides tanned by superior processes. Heat, cold, strain, water, oil, or acid fumes have no ill effect on "Spartan" Belting. It's the belting supreme.

A New G&K catalog is just off the press. Lists our complete and extensive line—belts for all purposes. A postal brings a copy.

On Active Service

—One or other of the Famous Five Files will be found on the benches in nearly every workshop in Canada.

The machine shop man likes them for their balance and cutting qualities.
The carpenter chooses them for the same reasons.

The blacksmith prefers them for their rugged strength.

Sixty millions of them are made and used every year.

And they always give satisfaction.
Specify them when ordering.

The Famous Five are:

Grooves Cut with Huther Bros. Dado Heads

Fits Any Saw Mandrel

A Huther Bros. Dado Head consists of two outside cutters and enough inside cutters to make the required cut. This Head will cut perfect grooves, with or across grain, any width. It is an easy Head to keep in perfect condition, has a simple quick adjustment, and may be enlarged any time after purchase. Sent on approval and if not satisfactory return at our expense.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. **Get Catalog "H."**

GALT, ONTARIO

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

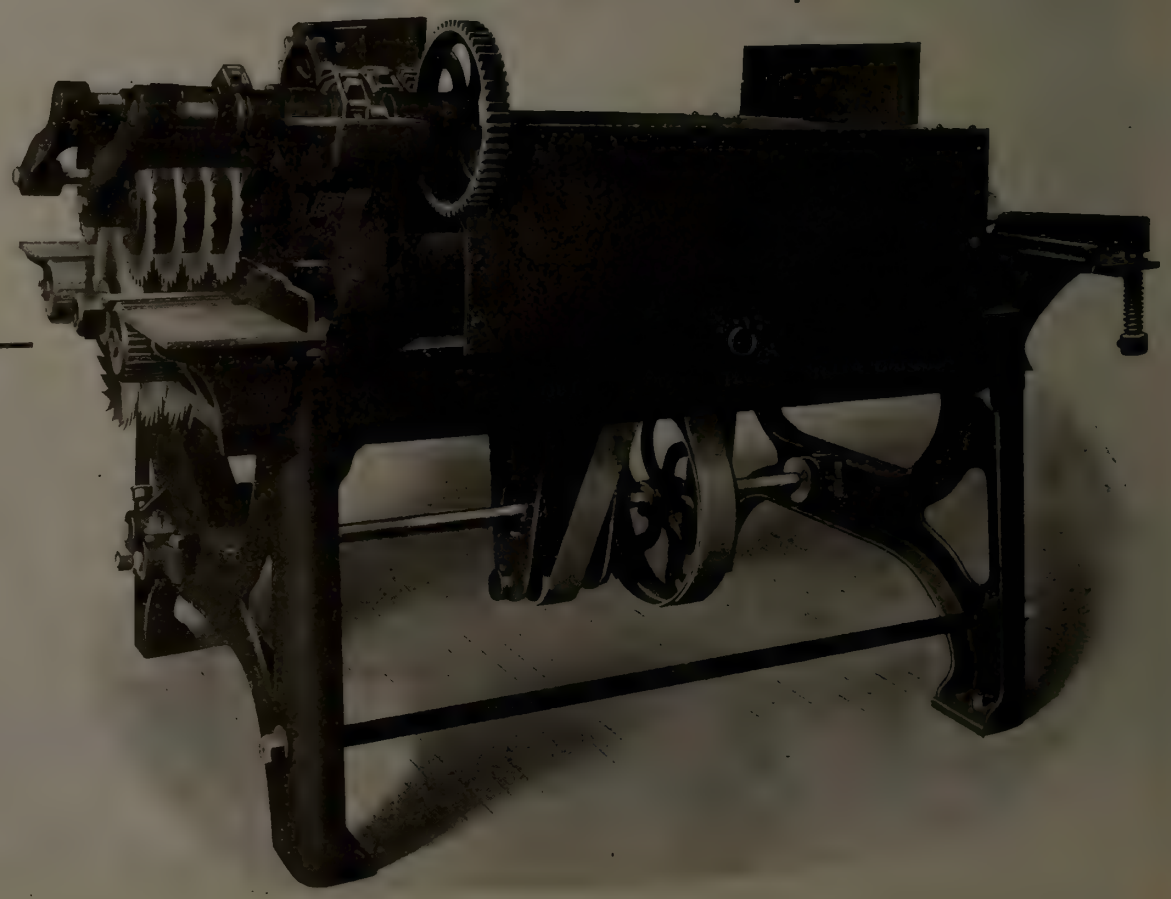
Lath Machine and Bolter

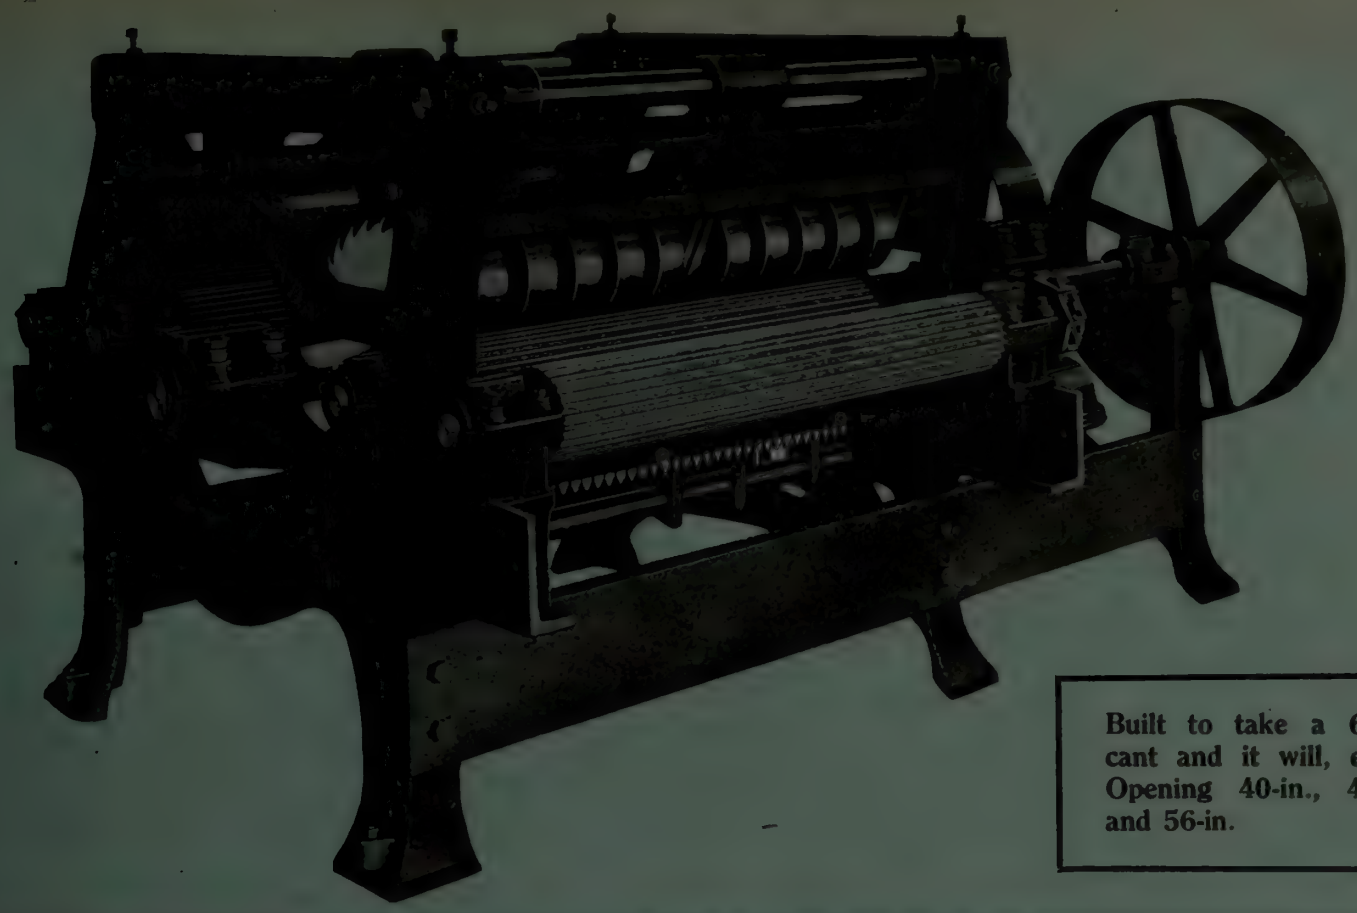
This machine is a combination of our No. 2 Bolter and No. 2 Lath Machine mounted in a single frame. The lath machine is made the opposite hand to our shingle machine. The illustration shows the bolter side of the combination. In mills where the floor space is limited and the output must be large this machine is an ideal combination. The details of construction found in our No. 2 Lath Mill and No. 2 Bolter apply to the combined machine.

When you overhaul your mill get in touch with us about new equipment.

The E. Long Manufacturing Company, Limited

Orillia - Ontario





Built to take a 6-inch cant and it will, easily. Opening 40-in., 48-in., and 56-in.

'NEW CHAMPION' EDGERS

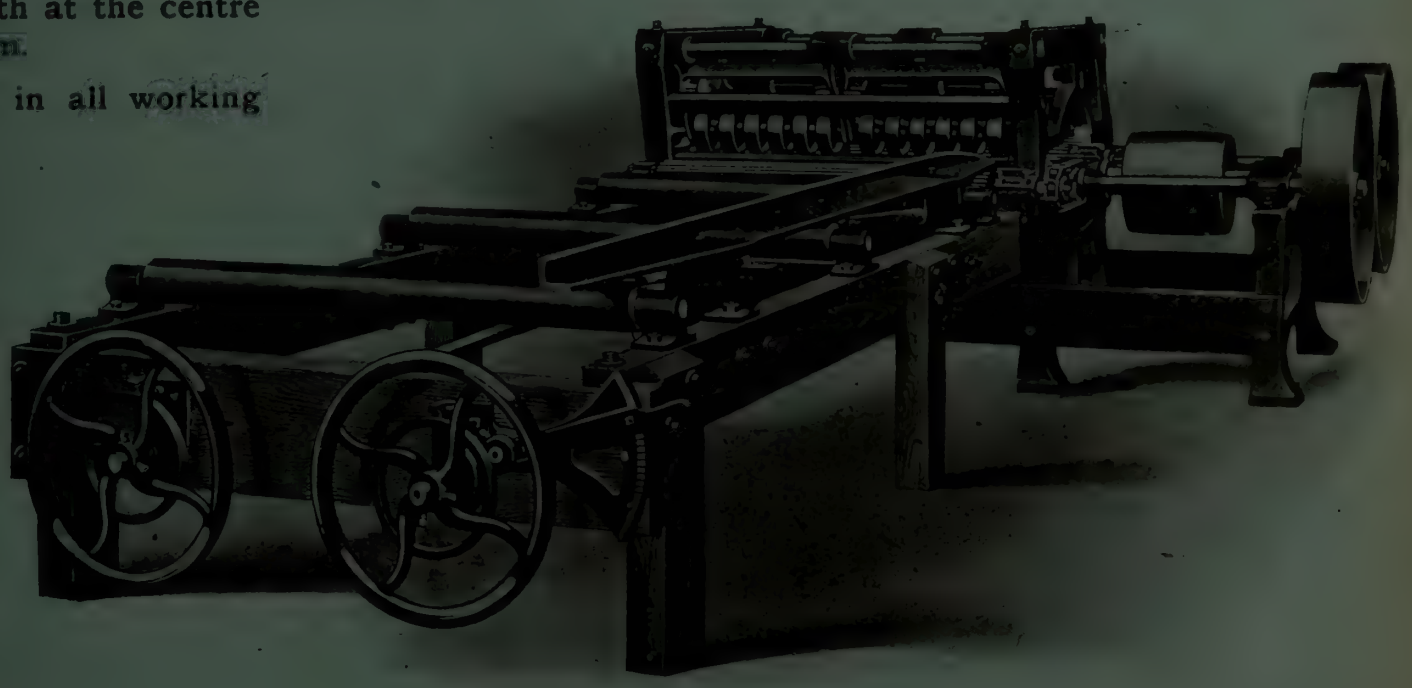
Have 3 Points of Superiority—that *mean* something

1—***A Locking Device***—that crowds the saw guides into correct position automatically and locks them there.

2—***Double Contact Saw Guides***—that hold the saw blade both at the centre and at the rim.

3—***Extra Strength*** in all working parts.

These three features mean—correctly edged lumber, smooth edged lumber, and lots of it.



A 6-inch cant will go through this machine as easily as a 2-inch plank, and will come out edged to a hair.

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

THE PLANT BEHIND

DEARBORN FEED-WATER TREATMENT

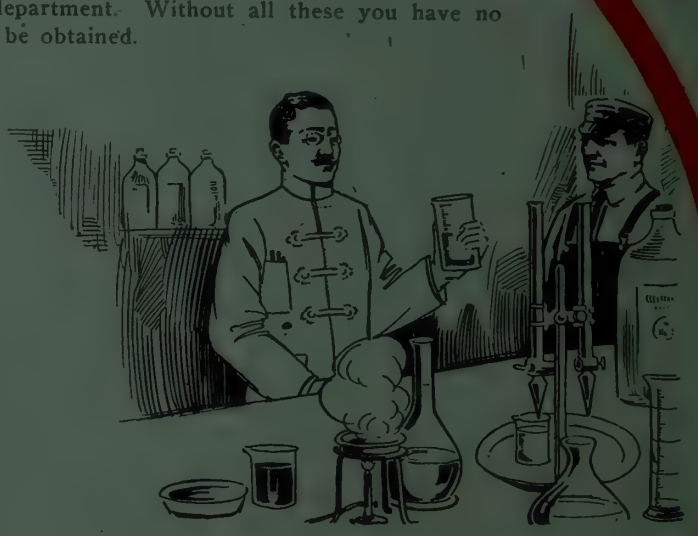
Dearborn Methods

Dearborn Scientific Treatment of Boiler Feed Waters

Hit the Mark

In order to intelligently cope with the subject of feed water treatment, a thorough knowledge of Chemistry, both theoretical and applied, and of steam engineering, both practical and theoretical, must be at hand. Complete, suitable, and properly equipped laboratories must be maintained and operated by thorough and competent chemists, especially trained as water analysts, and of equal importance, a suitably equipped manufacturing plant, for the proper compounding and mixing of such preparations as are prescribed for each specific case from formula constructed and furnished by the technical department. Without all these you have no reliable assurance that satisfactory or the best results will be obtained.

DEARBORN WATER TREATING PREPARATIONS are scientifically prepared to meet the requirements of the mineral ingredients and other objectionable constituents of the water, the percentage of each mineral salt governing the percentage of the antidotal ingredient in the treatment. By these methods we avoid the use of an excess or deficiency of any part of the treatment, every pound being utilized in the reactions taking place. There is no mechanical, unknown, or unlooked for result obtained from the use of our goods; we cause a complete chemical reaction to take place between the deleterious constituents of the water and the ingredients of our preparations.



GREATER EFFICIENCY
ELIMINATE
BOILER TROUBLES
SATISFACTION

NO MATTER WHAT the type or size of your boiler may be, Dearborn Service will give you increased steaming capacity and effect important economies.

IT'S ONLY GOOD BUSINESS for you to investigate any proposition which promises big economies and big gains in operating efficiency.

SEND a gallon sample of feed water for analysis.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

SATIN-LIKE INTERIOR TRIM

ARKANSAS SOFT PINE
TRADE MARK

SOFT, WORKABLE COMMON LUMBER

Can You Answer

When a customer asks for advice on painting and finishing?

It is to help you answer such questions authoritatively whenever the query relates to

Arkansas Soft Pine

that we recently arranged a test on painting and finishing twenty-five specimens of Arkansas Soft Pine by the Institute of Industrial Research at Washington, D.C., under the personal supervision of Henry A. Gardner, Assistant Director.

These experiments are now completed, and the results have been compiled by Mr. Gardner into a set of directions for painting and finishing our product. We have put them in pamphlet form, and will be glad to send you a copy, Mr. Dealer.

These same directions are also being incorporated into a more elaborate book on painting and finishing, which will be ready for distribution to home-builders a little later on. Every person receiving the book will, of course, be advised that Arkansas Soft Pine is sold only through local dealers.

Just another instance of how we help you sell Trade Marked Arkansas Soft Pine—by studying our product, by educating the public to its use through national advertising, by standing behind the product with an identifying trade mark, and by referring direct inquiry to local dealers.

There is a distinct merchandising advantage to you in selling a specific wood for a specific purpose, rather than mere "lumber." Arkansas Soft Pine is nationally known as "The Satin-like Interior Trim."

Send for your copy.

All stock bearing the Arkansas Soft Pine Trade Mark is manufactured and sold exclusively by the following companies:

THE HOME

is the very foundation of our National Life. To make Canadian homes all they should be, HEALTHFUL, COMFORTABLE, COMPANIONABLE, SERVICEABLE, and ATTRACTIVE, demands the application of all the knowledge and skill in regard to design, materials and method of erection which architects, builders and manufacturers possess.

Our racial experience has proved that of all available and possible materials, WOOD, by reason of its VITALITY, RESILIENCE, STRENGTH, PLEASING TEXTURE, BEAUTY of COLOR and GRAIN, and because it keeps out heat and cold, stands pre-eminent, and is in fact indispensable in the building of a home.

Scientific tests as well as long experience, have demonstrated that British Columbia woods are unsurpassed for structural or finish work. Investigations have shown that British Columbia contains the chief supply of softwood timber in the British Empire. As an architect, or as a dealer or worker in Building Materials you will want to inform yourself in regard to these woods, which within ten years will dominate the lumber markets of the world.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, October 15, 1916 No. 20

Shell Box Inspector Helping Manufacturers

In the course of a discussion upon the shell box industry recently, a prominent lumberman interested in the manufacture and wholesale marketing of stocks suitable for shell boxes, expressed the opinion that the Imperial Munitions Board, by the appointment of an inspector to visit plants and criticize and assist manufacturers, had done the industry an excellent turn. It is common knowledge, he said, that for some time there was much dissatisfaction among box manufacturers over the system of inspection of the work done. In numerous cases the inspectors went to extremes. At one plant they would give a very severe inspection, working a hardship on the manufacturer; in many cases the inspection being performed by men who had no knowledge of the work. At other factories the inspection ran to the other extreme, amounting really to very little inspection at all, thus enabling a manufacturer to get away with practically anything he wanted to turn out. This led to such widespread disapproval among manufacturers that the Imperial Munitions Board took action and appointed Mr. C. M. Tremear to a position which required him to visit manufacturers and to criticize and assist them in their work. Mr. Tremear is a practical woodworker and thoroughly acquainted with everything essential in connection with such duties. His efforts on behalf of the shell box manufacturers have been much appreciated by the manufacturers themselves.

In conversation with a number of these box manufacturers, we have been informed that the new system has been a great benefit. Mr. Tremear has been able to advise the manufacturers just where they were making their mistakes, and to correct them at a minimum of cost, making extensive savings both to the manufacturers and to the Imperial Munitions Board. He is not only a practical woodworker, but, before his appointment had had considerable experience in connection with the production of shell boxes and is conversant with the requirements of the Munitions Board. We are sure, from information received from men who have visited a large number of plants, that this move was an excellent one, in the interests of the efficient production of shell boxes, and we only hope that the Board will continue to place men in control of their inspection who understand what is required, rather than permit the work to be done by men who may secure their appointment by political influence. Of course, it is not to be expected that this new system will meet the approval of those under whose charge the inspection work was carried on previously. We believe, however, that it is a step in the right direction and know that the Imperial Munitions Board is receiving the commendation of shell box manufacturers in general for the step they have taken.

Loose Credits—The Root of Most Retail Evils

The retail lumber dealer is concerned, or ought to be, more than anything else about the class of customer that he is selling to, and about his personal relations with the customer. Two things are important in this regard. One is the financial standing of the customer and the other is the way in which the retailer treats his customer in regard to the credit which he grants him. These two things really make up one branch of the retailer's work, that of credits, and this branch is many times more important than anything else which the retailer has to think about.

Back of the matter of credits there must lie the individuality of the retailer himself. If he is a good business man he will either take charge of the credit end of the business himself or put it in the hands of a man whom he knows to be a specialist at this kind of work. Even then he will keep close touch upon the work of this man. The great majority of deals going through a retail office are upon a credit basis and it is necessary for the manager or the man in charge of the credit work to arm himself with everything available in the way of information and experience that will help him to deal with the numerous problems he has to solve. In short, the arrangement of any deal for the sale and delivery of a quantity of lumber from a retail yard resolves itself into a problem in which the two parties to the deal are themselves its chief elements, and it is upon the way in which the dealer or his credit man proves himself capable of handling these problems that the soundness and the future development of the business has its foundation. The retailer must, in short, become as good a judge of the deserts of an applicant for credit, or in other words of the large majority of his customers, as a banker is of those who come to him for loans.

How many retail lumbermen can say to themselves that they have measured up to the rudimentary requirements of a good credit man? We do not believe that the number is anything like as large as it should be. One only needs to take a glance at the ledger of even the best retail firms with which he is acquainted in order to see that many a customer who has no right to do so, gets away with large quantities of stock on the most flimsy sort of promises to pay, and that the quantity of bad debts written off from year to year is far too large a proportion of the actual volume of trade conducted.

Why is it so difficult for a retailer to make sure whether his prospective customer is a safe man to whom to extend credit? The man who buys lumber, taking him on the average, is much the same as the man who buys anything else. The retailer ought to be able to size him up better than he appears to do in many cases. Is it perhaps that the great quantity of routine and detail which a retailer has to handle throughout his business day takes his mind off the credit end and that when a man calls for a quotation he is likely to see in him only a prospective customer and not a prospective debtor? There is a good deal in this idea. We believe that the conduct of a retail business is not conducive of the production of ability to size up a customer to the extent that the business demands, and that in some way or other it is generally necessary for a retailer to give his credit work the special attention of a particular man who has nothing else for which to be responsible, whether he is employed in the office itself or is conducting a bureau for the exchange of credit information on behalf of the lumber trade in general.

From an acquaintance with retailers, extending over a number of

years, we have become convinced that there is something wanting along this line. The retailers have been far too keen to close their deals, to book their customers and to deliver stock, than they should have been. They have neglected the other end of the business and have been losers thereby. Many of them have lost far more than enough money in bad debts to pay all the expenses of good credit specialists who would have steered them clear of a large portion of their losses. In the office of every retail lumberman there should be a man whose duty it is to interview customers and size them up, from the credit point of view. No customer who is worth while having will object to questions about his intentions in the matter of paying for goods; in fact if he is a good paying customer he will be glad to let the retailer know that he is going to get his money promptly, as he will count upon better treatment when he makes this fact known. But unfortunately, in the past we have seen retailers going to the other extreme, thinking apparently that good business demanded it. We have seen them hunting for business with cut price inducements, and, careless credit considerations that advertised them to the crooks as easy prey. We have heard of them keeping solicitors on the street to get in touch with every prospective customer, whether he is a bona-fide owner of a building that is being put up, or is a fly-by-night speculative builder who puts up cheap houses on the lumberman's money and disappears whenever he finds himself in deep water. It is the same old story over and over again, from one firm and another, year in and year out, in good times and bad; too much anxiety to book an order and far too little consideration of whether the goods delivered are going to be paid for.

There is only one way in which to remedy all this; changing the method of handling customers, so that the percentage of bad ones will be reduced. To do this it is necessary to employ a modern and businesslike method of getting after those who are slow or crooked. The most effective method is by co-operating in the creation of a credit bureau which analyzes information furnished by the dealers themselves and thus forewarns them against those men whose methods have been proven to be dangerous. Co-operation of this nature accompanied by the employment of a skilled credit man in the office will enable any retail lumberman to reduce his proportion of bad debts to a mere fraction of their present amount.

Mill Construction Coming Into Its Own

The awakened interest in mill construction factory buildings, which is evident in many cities, makes the publication of any specific data on the subject of unusual value. Reinforced concrete buildings have been the strongest competitors of mill construction, and in many cities have become the predominating type almost entirely because they have been promoted and their advantages called to the attention of architects, engineers, and contractors.

Comparisons on a cost basis such as are contained in Technical Letter No. 6 of the Engineering Bureau of the National Lumber Manufacturers' Association of the United States are bound to be important factors in turning the decision of prospective builders to mill construction instead of concrete. This is especially true when the comparisons, as in this case, are made by an architect and engineer of high standing. Mr. F. E. Davidson, of Chicago, who is the author, is president of the Illinois Society of Architects. He writes from the basis of wide experience and practical knowledge, and has erected many very high-class buildings of the mill construction type in Chicago. His figures are not theoretical, but based on comparisons of two actual buildings.

Perhaps the most striking statement is that "the increased cost of a strictly fireproof manufacturing building is from 25 to 35 per cent. greater than the actual first cost of an exactly similar standard mill building." He figures depreciation charges at 3½ per cent. per year on standard mill buildings, as against 2½ per cent. on absolutely fireproof buildings. As to maintenance charges, Mr. Davidson states that he does not know of accurate records of maintenance which are more than three-fourths of one per cent. per year for mill buildings, while the same charges on fireproof buildings do not average less than one-half per cent. per year. In other words, the maintenance charges are essentially the same.

On the important question of insurance rating Mr. Davidson says: "Every architect and engineer, of course, knows that a standard mill sprinklered building is given a much lower insurance rating than an absolutely fireproof building if unsprinklered." Even if the latter is sprinklered, the difference in the actual rating between the two types with ordinary occupancy "would only amount to about 10 cents per $1,000 per year on the insurable value of the building."

On the advantages of standard mill construction Mr. Davidson writes as follows: "Thus, considering first cost, depreciation, maintenance, and insurance only, the argument is all in favor of the standard mill building, and when I refer to a standard mill building I mean a building designed by a thoroughly competent industrial architect, who will enclose all stairs and elevators with brick masonry walls and have the openings to same protected with automatic fire-doors, and with all windows, with the possible exception of street frontages, of sheet metal and glazed with wired glass, and with no unprotected vertical openings between any floors in the building. These are items which, more than any others, affect insurance ratings on any building."

In conclusion, Mr. Davidson gives specific cases, comparing concrete and mill construction buildings with exactly the same plans per cubic contents. He says: "In this instance it will be noted that the cost of the concrete structure would have been about 30 per cent. more than the cost of the mill building, and this saving to the owner was effected in addition to the advantages he gained in the matter of quick erection, etc. The insurance rate is the same on the standard mill building as it would have been on the concrete structure."

The moral of this, from the lumberman's point of view, is quite plain. Every lumberman ought to be a specialist in regard to the uses of wood, and have such information as that given above at his finger-ends, to pass on to prospective builders who are considering the use of cement or other so-called fireproof materials.

What Forest Fires Cost Canada in 1916

Canada has lost through forest fires in 1916 over nine million dollars. This equals more than six times what has been spent on forest protection work from coast to coast. The enormous sum wasted through this year's forest fires, most of which were preventable, would add another $480 to the first year's pension allowances of nearly 19,000 Canadian soldiers.

It is noteworthy that while some parts of the Dominion owe to rainy weather their immunity from fire damage, the season's record proves beyond gainsay that in areas where first-rate fire protection systems were in operation losses of life and property were held down to a remarkable minimum.

Quebec had some heavy fires in the Lake St. John and Saguenay districts also in the Gaspe Peninsula and west of Escalana, on the Transcontinental Railway. It is a striking fact, however, that within the 24,000 square miles of Quebec, covered by the two well-organized associations of limit-holders, the amount of green timber burnt is practically negligible. This immunity was not a matter of luck, but of consistent patient effort to educate settlers, lumberjacks, and others in care with fire, coupled with a system of promptly reporting all outbreaks and attacking forest fires in their incipiency with larges forces of men and modern equipment.

British Columbia faced fairly favorable fire conditions through the summer months, and the cost of fire fighting was reduced by about 75 per cent., as compared with the record of 1915. The number of

fires was about half of last year. The British Columbia forest protection service is the most complete in Canada thus far, and the saving of timber is a logical consequence.

A heavy average of rainfall kept fire troubles at arm's length in Alberta, Saskatchewan, and Manitoba, and this weather condition was undoubtedly responsible for the escape of the main areas of big timber throughout Ontario. The Clay Belt fires at the end of July and first week of August provided a tragic sacrifice of 262 lives and what is estimated to be six million dollars' worth of property. There was practically no forest guarding organization in the fire-swept district, except along the railway track.

New Brunswick escaped the risks of 1916 with a very small timber loss, and Nova Scotia had a similar experience. The records of the Dominion Railway Board show that the private-owned railway lines of Canada have not been responsible this year for any damaging forest fires.

Shipbuilding May Become Important Industry in Canada

The increased activity that is being displayed, both in Eastern and Western Canada in the shipbuilding industry as a means of developing our export trade, especially that in lumber, is of great importance to the industry. If it is carried out to its logical extent it will go a long way to remove the barriers against foreign shipment, and thus relieve the lumber industry of one of the chief causes of periodical trade depression. Elsewhere in this issue we publish a discussion of this development as it affects British Columbia. We are also able to reproduce below an interesting reference to a much wider aspect of the situation, as published by the Liverpool Journal of Commerce.

"There are indications," the Journal of Commerce says, "that, even probably before the end of the war, a new epoch in shipbuilding will develop in connection with the British Empire, and that certain famous shipbuilding and engineering firms in this country will open yards in Canada and probably in Australia.

"Such a possibility three or four years ago would have been regarded in a negative way, for it is a peculiar fact that the bulk of the people in this country, outside the shipbuilding areas, are ignorant of the supreme national importance of the shipbuilding and allied industries.

"The war has brought about in a rapid and vivid manner the realization of the fact that on shipowing and shipbuillding the future of the British Empire will have to rely to a very great extent.

"It has been hinted that Messrs. Vickers & Company contemplate a considerable expansion in Canada, and there is linked with the name of this firm that of Messrs. Yarrow, of Scotstoun, who already are directly interested in an extremely important ship-repairing and shipbuilding enterprise on the west coast of Canada. The famous firm of Messrs. Sir W. G. Armstrong, Whitworth & Co., as is well known, had some time ago realized the potentialities of Canada for shipbuilding purposes, and have been engaged for some time there, but it is further interesting to hear the suggestion that Messrs. Cammell, Laird & Co., and also Messrs. John Brown & Co., Clydebank, are on the point of laying plans for shipbuilding purposes in Canada.

"Whatever immediate foundation there may be for these rumors, there can be no doubt that the shipbuilding firms of this country are the most progressive and the most enlightened of any such firms in the world, and that they may be relied upon not only to continue the lead, which they have held for years, but under the new conditions and the broader sympathies of the Empire, that they will increase this lead to an extent that, at any rate for many generations, will enable the shipbuilding industry of the British Empire to dominate that of the whole world, whatever activities may be in progress in the United States and whatever developments Germany may subsequently desire to put into operation.

"Very wisely the Dominion Government is offering inducements to these great and reputable firms, and not only may it be announced in the future that Canada will be building many of its own ships, but this division and spreading out of the industry will have a very fine effect in readjusting the relationship of labor and in making provision for those new conditions of industrial life that must inevitably follow as a result of the present world upheaval."

Editorial Short Lengths for Busy Readers

On account of the great scarcity, and high price of iron during the war, there has been commenced in Norway the manufacture of turbine tubing made from wood. The tubes are wound spirally with steel wire, and are said to be fully as durable as the iron tubes. The factory has already a large number of orders.

Speaking in the British House of Commons on Oct. 10th, the War Minister, Mr. Lloyd George, said the valuable assistance of the Canadian forestry battalions was fully recognized. It had been already arranged for a proper co-ordination of their work, and that all the battalions, whether at home or abroad, should operate under the direct control of one expert Canadian officer. The suggestion made that all lumbering should be under Canadian control was being carried out as regards soft wood in France, but it was not desirable to disturb the existing arrangements for other kinds of timber in the war zone. The War Minister was replying to Bennet Goldney, who had urged that all timber cutting should be put under Canadian control, seeing that the Canadians had proved themselves so superior in this work while in England.

One hears so frequently that the timber resources of British Columbia are practically inexhaustible that it is interesting to learn that a lumberman—Reeve Lougheed, of Maple Ridge—has recently expressed himself to the contrary effect. Before a convention of Dominion fire rangers, held at New Westminster, Reeve Lougheed said it was customary to assume that the timber wealth of the province was inexhaustible; that it grew faster than it could be cut. In a sense this was true, but much of the forest wealth was on the mountain tops, where is was so nearly inaccessible that it could not be cut for a long time. The accessible timber, he said, was rapidly being cut, and if something in the way of reforestration were not done now there would be very little left of it in the course of fifteen years. He advocated experiments with Eastern hardwoods in burned-over areas, believing that this would be more practicable than using the slow-growing fir and cedar that were native to the province.

At the same meeting the fire rangers discussed methods of preventing and fighting forest fires. A resolution was passed asking the provincial government to amend the bush act so that it will once more be necessary to have a permit for setting out a fire up till October 1st. During the past two years no permit has been necessary after September 15th, and the rangers say experience has shown that the last two weeks in September are frequently the most dangerous of the whole season.

During the recent visit of Sir George Foster to Victoria, B.C., a deputation representing the lumber interests of Vancouver Island had an interview with him and urged him to do what he can to help in bringing about a reciprocity agreement between Canada and Australia and New Zealand. They pointed out to the Minister of Trade and Commerce that British Columbia can furnish Australia and New Zealand with great quantities of lumber, and also wood pulp and paper, while there is a market in Canada for large quantities of meat, butter, wool, and hides from Australia. An extensive interchange of goods between these countries could be carried on to the mutual benefit of all concerned. The deputation also urged the Minister to use his influence for securing the appointment of a Canadian customs official in New York.

242nd Forestry Battalion Leaves for Overseas

Lieut. G. T. Reid—242nd. Forestry Batt.

The 242nd Forestry Battalion, for service in the forests of Great Britain and elsewhere, which has been raised during the past few months, under Lieut.-Col. J. B. White, of the Riordon Pulp and Paper Company, Ltd., Montreal, was recently completed to the full strength of an infantry battalion. C Company of the battalion was raised in Toronto and other Ontario points, under Lieut. G. T. Reid, son of Mr. J. B. Reid, of Reid & Company, retail lumber dealers, Toronto. C Company left for Montreal on October 4th, where the battalion mobilized, and expected to leave for overseas about Oct. 15. The marching state of C Company was 150 men.

The 242nd Forestry Battalion is officered almost exclusively by men who have had practical experience in the lumbering business, among them being Lieut.-Col. J. B. White, in command; Major Donnoly, formerly with the 60th Canadian Overseas Battalion; Capt. Massiah, formerly with the C.P.R.; Capt. Bourassa, Ottawa; Capt. Lang, Ottawa; Capt. Fenton, Ottawa, a returned officer; Capt. Suckling, Montreal; Lieut. George Perley, nephew of Sir George Perley; Lieut. Strong, of the Strong Lumber Company, Montreal; Lieut. G. T. Reid, Toronto, and Lieut. Hughson, Montreal.

During the enlistment of C Company at Toronto the lumbermen of Toronto took an active interest in the affairs of the company, and contributed $1,000 to assist in financing it. About $2,000 was also raised in other ways. The men composing the 242nd Forestry Battalion are specially fitted for the work of felling and cutting timber in the forests of Great Britain and Europe. They are a fine, husky lot, practically all of whom have had a long experience in Canadian woods.

Lieut. G. T. Reid, whose portrait appears at the head of this article, is typical of nearly all the officers of the battalion. He has spent all of his business life in the lumber business, having had a year and a half in the bush in Quebec, a taste of the road as a salesman, and a long experience in the yard and office of Reid & Co., Toronto.

German Architecture in Dugouts on the Battle Line

The recent capture of extensive lines of German trenches by the allies has made it possible to learn something of the manner in which the Germans have used wood in the construction of their defences. The London Timber Trades Journal reprints an article on this subject, written by an architect for an English newspaper, in which he says:

"Judging from the plans of the dugouts captured from the Germans it is clear that the enemy employed a soldier-architect to assist the military engineers in making these halls comfortable.

"The timber construction is of the post-and-fan type. In the main it consists of a series of balk timbers, spaced at intervals of six feet, doing duty as stanchions; these run through the two floors. The timbers of the intermediate stage are framed into the story posts with stout beams. A similar system exists to carry the wooden sheeting immediately under the earth on the upper story. There is nothing special in the construction employed by the enemy, and in many ways the British dugouts, while of a more temporary nature, are far stronger, for they follow the system of braced props which is a feature of mining practice.

"Yet, notwithstanding the simplicity of the methods employed by the Germans for what they considered would be in their possession for the duration of the war, a certain decorative character is to be seen in the banded neckings to the upper part of the posts, in the paper wave ornament introduced into the officers' quarters, and in the birdcage balustrade to the stairways.

"At first sight the drawings of these elaborate underground halls recall the posts and framings which in the old days distinguished the three-decker. Then one thinks of the roof timbers associated with the factories and warehouses of the century before last, and finally one decides that timber construction offers many possibilities for small modern buildings. One lesson to be learned from the example of the Germans in this is that timber could be extensively and artistically used for rebuilding farmhouses and cottages in the areas visited by the devastation of the war."

The British steamer Crown of Seville, which sailed on September 22nd from Seattle, Wash., for London, carried 3,100,000 feet of spruce lumber consigned to the British Government. The lumber is used for constructing military aeroplanes. The shipment was one of the largest ever made from that port.

Lieut. C. P. Waldie Reported Killed

Lieut. C. P. Waldie—Reported Killed.

The Canadian casualty list of October 2nd contained the name of Lieut. Charles Percy Waldie, who has been missing since the battle of Loos, one year ago. The fact that Lieut. Waldie was then missing was reported at the time. A cablegram from the War Office now announces that for official purposes he is presumed to have died about September 26th, 1915.

Lieut. C. P. Waldie was the son of the late John Waldie, head of the Victoria Harbor Lumber Company, of Toronto and Victoria Harbor, Ont. He was well known to the lumbermen of the province, having occupied for a number of years the position of manager of the Victoria Harbor Mills. Soon after the outbreak of the war he went to England and took an officer's training course in the Inns of Court. Shortly after qualifying he accepted a commission with the Queens Royal West Surrey Regiment, and was stationed for a time at Worthing, England, subsequently proceeding with his regiment to France. Previous to the war, Lieut. Waldie had had no military experience, but he was one of those who felt the call of duty as soon as the war broke out. He was 32 years old, born in Canada and a graduate of Upper Canada College. He had made a great many friends among the lumbermen of Ontario who will learn with the deepest regret of his loss. Mr. F. N. Waldie, a brother, is well known as manager of the Victoria Harbor Lumber Company and Mr. R. S. Waldie is also well known to the lumber trade. Another brother, Capt. W. Scott Waldie is with the 122nd battalion, which has been in training at Camp Borden during the past summer.

Pacific Coast Shingle Men Hold Vancouver Meeting

A delegation of American red cedar shingle manufacturers, members of the West Coast Lumberman's Association, held a two-day session in Vancouver recently as guests of the Huntting-Merritt Lumber Company; Westminster Mill, Limited; Thurston, Flavelle Lumber Company, and the Vancouver Cedar Mills. The meeting was one of the many gatherings that have resulted from the decision of the cedar shingle interests of the Pacific Northwest to get together for the common weal of the red cedar shingle industry. The American and British Columbia mills sell practically in the same market. The delegates represented practically every district engaged in the manufacture of red cedar shingles in the Pacific Northwest. After the business meeting which was held in the offices of the B. C. Lumbermen's Association a golf tournament was played at the Shaughnessy Heights Golf and Country Club grounds. The cup, presented by the British Columbia mills, was won by Mr. H. C. Wyckoff, secretary of the West Coast Association. After the tourney the visitors attended a business dinner at the Vancouver Club.

The evening session was mainly devoted to a discussion of the present national advertising campaign which has been carried on by the association during the present year. It was the consensus of opinion that this advertising had done much to offset the competition of patent roofings, and had increased the building of bungalows, garages, barns, etc., on which cedar shingles were used. Mr. Josephs, of the Retail Lumbermen's Association of Kansas City, stated that through the efforts of newspaper and magazine advertising, retailers had been compelled to supply their customers with red cedar shingles when, as a matter of fact, they had been gradually getting into the substitute roofing habit. The visitors were taken on a tour of inspection and visited the Vancouver Cedar Mills, the Huntting-Merritt Lumber Company, the Thurston-Flavelle Lumber Company and the Westminster Mills, Limited.

New Brunswick and Maine Lumbermen Organizing

Owners of lumber mills and timber lands in New Brunswick and Maine met in Bangor recently for the purpose of forming a lumbermen's association, international in scope, and probably the most important organization of its kind in northern New England. The association may also extend into New Hampshire. Another meeting for the purpose of completing organization will be held in Bangor this month. The organization will be purely a lumbermen's and timberland owners' association for the mutual benefit of the business men concerned.

H. R. MacMillan Accepts Important Business Appointment

Mr. H. R. MacMillan.

H. R. MacMillan, head of the Forest Branch of the British Columbia Department of Lands, has resigned in order to accept the position of assistant manager of the Victoria Lumber and Manufacturing Company, Limited, Chemainus, B.C., of which E. J. Palmer—one of the most experienced of Pacific Coast lumbermen—is general manager. Mr. MacMillan returned to Victoria at the end of July from a world tour as Canadian lumber trade commissioner; and expected to leave again for China, Japan, and Russia to complete his work, but received a wire from the Department of Trade and Commerce, Ottawa, cancelling the previous instructions sent him.

By the resignation of Mr. MacMillan British Columbia loses an official who since taking office a few years ago has organized the Forestry Branch and brought it to a stage of perfection which has made it a pattern from which other provinces have been glad to cupy, Mr. MacMillan went to British Columbia in 1912 from Ottawa, where for nine years he had been assistant of forestry for the Dominion Government. He is a graduate of Toronto and Yale Universities, his course in forestry being taken at the latter institution. Mr. MacMillan has displayed admirable judgment and rare forestric insight in the handling of his department, and the splendid results brought about by the admirable system of forest fire protection initiated a few years ago and now brought to great perfection will in particular be remembered to his credit.

The firm with which Mr. MacMillan is now connected is one of the largest timber-holding and manufacturing concerns in the province, and among the shareholders are capitalists who control enormous timber interests in Washington, Oregon, and adjoining states. This being the case, we may expect that Mr. MacMillan's ripe talents in the way of forest administration and conservation will still find full scope for action.

J. O. Cameron Foresees Improved Trade

One of the many British Columbia lumbermen who are optimistic about the future of the lumbering industry in Western Canada is Mr. J. O. Cameron, of the Cameron-Genoa Bay Mills Lumber Company, Ltd., Victoria, B.C. In a recent interview Mr. Cameron said in part: "During the last two years the timber business has been poor, although there was a regular demand. The mills were prevented from engaging in the offshore trade by the scarcity of bottoms, the difficulty being accentuated by the landslide in the Panama Canal. It is now necessary to ship east by rail at a high rate, the timber transported being principally in the form of box shooks for ammunition boxes and aeroplane spruce, being bought by the Imperial Government. The skilled labor market has been reduced by enlistments, making Orientals more independent and increasing their wages one third. The war has seriously hampered work in the woods, where only white labor has been employed." The shipbuilding industry now flourishing in Victoria, Vancouver, and Westminster will, according to Mr. Cameron, be the means of affording relief to the situation by making it possible to extend the markets. Mr. Cameron stated that he believes that the growth of timber in British Columbia is more than keeping pace with consumption, especially since ample protection against forest fires now is provided by the Government. The best timber area is yet to be touched, the mills being compelled to limit their operations almost entirely to the coast districts until the new timber lands can be reached by railroads.

With regard to the establishment of new markets Mr. Cameron said that the greatest stimulant that the lumbering industry could receive, after tonnage had been provided, would be the granting of a preferential tariff with the Empire, to protect the industry from competition with the older established mills on the other side of the boundary. The principal markets would be on the shores of the Pacific, in China, Australia, and South America, although at present the trade with Australia is less than it was thirty years ago, on account of the fact that Canada needs a large proportion of British Columbia's timber for her own development.

Over 400 square miles of territory in the Peace River country have been burned over by forest fires reported about the end of September.

Death of Erastus Long, of Orillia, Ont.

The Late E. Long, Orillia, Ont.

News of the death of Mr. Erastus Long, of the E. Long Manufacturing Company, Ltd., Orillia, Ont., will be received with regret by lumbermen in all parts of Canada. Mr. Long's name was known to practically every lumberman in the country, on account of his long connection with the production of sawmill machinery. Last spring he laid aside his business activities and went to his cottage at Champlain Point to take a rest. Unfortunately, his health was already too much impaired, and he was brought back to Orillia towards the end of September, suffering from paralysis. For a time he seemed to recover slightly, but the end came on October 4th.

The late Mr. Long was born in the Township of Oro in 1868. As a lad he went to Orillia and learned the machinist trade with his uncle, the late Robert Brammer. Subsequently he went to Chicago, and quickly rose until he became a master mechanic. He returned to Orillia in 1894, upon the death of Mr. Brammer, and took over the business of the Orillia Foundry. This he developed steadily, until it became one of the most extensive plants in Canada for the production of sawmill machinery. In 1906 he took into partnership his half-brother, Mr. Francis Smith, and Mr. W. W. McBain, and organized the E. Long Manufacturing Company, Ltd. This business grew rapidly. The present plant was completed in 1910.

The late Mr. Long took much interest in the public life of Orillia, serving for some years on the Town Council. He was a member of the Water, Light, and Power Commission which was organized in 1913, occupying the position of chairman of that body. He also gave much valuable service to Orillia in connection with its electric power plant.

The Price of Pulp and Paper—Some Interesting Figures

The monthly commercial letter issued by the Canadian Bank of Commerce has the following interesting article dealing with the pulp and paper situation:

"Although pulp and paper mills in Canada have for some time been operating at full capacity, stocks of news-print are decreasing. Prices of raw and partly manufactured materials for paper-making are very much higher than they were a year ago, the causes being chiefly the increase in the cost of production and the greater demand, particularly from the United States. Last year the cut of wood for pulp was far below normal, which has resulted in a shortage at a time of increased demand and increased cost. A year ago raw pulpwood could be purchased in Northern Ontario at $4 a cord, whereas this year the price is $5.25 and higher. While the most important factor in the increased cost of pulp is the increase in the cost of labor, the difficulty in procuring chemicals is also a contributory item. Up to the present the output of Canadian paper mills has not been checked by these factors, but during the summer fires and floods have caused some slight loss and interruption, although not to an appreciable extent. Contracts made during the early part of the year or previously are being filled, but there is a decided reluctance to contract far ahead, even at prevailing high prices. Additional increases in the cost of production are feared, and the demand for pulp and news-print will doubtless continue. The new mills planned and in course of construction and the extensions to existing ones will, if carried out as intended, add a per diem capacity of 840 tons of news-print before the end of 1918. During the twelve months ending March last the amount of printing paper exported was 463,204 tons, or at the rte of 1,544 tons per day, as compared with a tonnage of 292,579, or 975 tons per day, in the corresponding period ending March, 1914. In the export of and demand for wrapping paper there are also similar develoments, and these, even before the outbreak of the war, attained considerable proprotions. From 1910 to 1916, according to a diagram shown in the bank's report, exports of paper, pulp, pulpwood, etc., have risen from $15,000,000 to $37,000,000 in value. Exports of paper have risen from $3,000,000 to $20,000,000; exports of pulp (mechanical and chemical) from $5,000,000 to $10,000,000, and exports of pulpwood have hovered between $5,500,000 and $7,500,000 during the ten years.

Great Britain's imports during the year 1915 included the following from Canada:—wood pulp, chemically dry bleached, £1,104; wood pulp, chemically dry unbleached, £4,164; pit props or pit wood, £38,004; railway sleepers, £1,125.

A System of Accounts for Retailers

Fundamental Principles Clearly Explained—A Valuable Report Upon An All-Important Problem

The first part of an article on this subject was published in our issue of October 1st, and dealt with books of account and statements as explained in a report prepared by the Federal Trade Commission of the United States. The balance of the report is as follows:

Profit and Loss Statement.

The amounts for making up this statement, Form B, can be had from the ledger and from the trial balance. It is made up at such times as the inventory is taken. A physical inventory should be taken at least once a year. The basis should be cost with conservative deduction for obsolete and shelf-worn goods. The inventory at the beginning of the period is, of course, that brought down from the end of the last period.

When monthly profit and loss statements are desired, and where the percentage of overhead and profit is known, the approximate cost of the goods can be arrived at in the following manner: Deduct the percentage of overhead and profit from 100 and multiply by the amount of net sales; the result will be the cost of the goods sold, which, when deducted from net sales, will give the approximate gross profit on sales.

If desired, the difference between the values placed on the inventory and the actual cost of same can be shown on the statement. Show the actual cost of inventory and then the deduction under the title "Stock Depreciation," carrying the net forward as illustrated. While this is not necessary, it is valuable information, and this method is recommended.

The total net profit, as shown by the statement, is that carried to the credit of the proprietor's account in the ledger.

Ledger accounts should be kept by the double entry principle, with all real (asset and liability) accounts, as well as with all nominal (profit and loss) accounts. A balance sheet of the same date as the profit and loss statement should be made up from the balances of all real accounts. The ordinary asset and liability accounts and a logical classification thereof are shown by Form C.

Accounts and Their Explanations—Real Accounts.

1. Cash on Hand and in Bank.—Charge this account with the total receipts of the month and credit it with the total disbursements as shown by the cash book. The balance should agree with the cash book balance.

2. Notes Receivable—Trade Customers.—Charge this account with all notes, time drafts, and acceptances held against others, and credit it with the same when paid or otherwise disposed of. The balance will show the uncollected notes receivable.

3. Accounts Receivable—Trade Customers.—Charge this account with the total of the charge tickets of the month, and credit it with the cash payments by customers (taken from the cash book at end of month) and with notes receivable, discounts, returns, and allowances (from the journal and credit slips). Balance of this account must agree with the sum of the balances of trade customers' accounts.

4. Reserve for Bad Debts.—Credit this account with an estimated amount, based on charge sales, sufficient to provide for losses, and charge the account with the balances of personal accounts when hope of collection is abandoned.

5. Prepaid Insurance.—Charge this account with all insurance, fire, burglary, fidelity, plate glass, liability, etc. At the end of each month charge the proper accounts (Nos. 35 and 44) with their proportion, the balance being an asset as "Prepaid Insurance."

6. Accrued Interest Receivable.—Charge this account at the end of the period with all accrued interest (not yet paid) on notes, etc., due from others, crediting "Interest Account." When the interest is received it is credited to "Accrued Interest Receivable."

7. Store Property.—Charge this account with the purchase price of the store property. Do not charge repairs to this account, unless they are in the nature of permanent improvements. A fair amount should be periodically credited to "Reserve for Depreciation."

8. Warehouse Property.—Charge this account with the purchase price of the warehouse property. Do not charge repairs to this account unless they are in the nature of permanent improvements. A fair amount should be periodically credited to "Reserve for Depreciation."

9. Reserve for Depreciation on Store and Warehouse.—Credit this account with the amonut of depreciation on store and warehouse, and charge same to "Rent Income" (No. 44).

10. Store Equipment.—Charge this account with the value of all equipment, such as counters, shelving, scales, measures, etc., used in the conduct of the business. A fair amount should be written off periodically for depreciation.

11. Office Equipment.—Charge this account with office furniture, desks, safe, and other office appliances (not included in 34). A fair amount should be written off periodically for depreciation.

12. Delivery Equipment.—Charge this account with the cost of automobiles, wagons, horses, and harness. This account must not be charged with repairs to automobiles and wagons, horseshoeing, or anything of this nature. A fair amount should be written off periodically for depreciation.

13. Notes Payable—Trade Creditors.—Credit this account with all notes given to trade creditors or time drafts accepted in their favor and charge the account as the same are paid. Balance of this account shows the amount of notes payable outstanding.

14. Notes Payable—Banks.—Credit this account with all notes given to banks and charge the account as the same are paid.

15. Accounts Payable—Trade Creditors.—Credit this account with merchandise bought on account, the amount being carried to this account monthly from the total of the invoice book and charge it with all merchandise returned and reductions (journal), and payments made and discounts taken (cash book). Balance of this account must agree with the sum of the balances of trade creditors' accounts.

16. Accounts Payable—Others.—Credit this account with amounts owing to creditors other than trade creditors.

17. Accrued Interest Payable.—Credit this account at the end of the period with interest accrued (not yet paid) on notes, etc., due others, charging "Interest Account." When the interest is paid it is charged to "Accrued Interest Payable."

18. Accrued Salaries and Wages.—Credit this account with salaries and wages earned and unpaid at the end of each month and charge the proper expense accounts. When payment is made this account is charged and closed out, and the balance of the pay roll charged in the regular way.

19. Accrued Taxes.—Credit this account with the taxes due up to the end of each month, charging the proportionate amounts to the accounts in which they belong. When the taxes are paid this account will be charged.

20. Proprietor's Drawing Account.—Charge this account with all withdrawals of cash (not salary). At the end of the period the amount of this account is closed into proprietor's capital account.

21. Mortgage Payable.—When a mortgage is placed upon real

FORM B.

estate (or assumed at the time of purchase) this account is credited. When paid it is charged.

22. Proprietor's Capital Account.—This account represents the proprietor's net capital. At the end of the period the net profit is credited to this account. The amount of his drawing account is then closed into this account. The balance of the account is his net capital at time of closing.

In the event of a partnership each partner's net capital would be shown in his respective account and the net profit (or loss) carried to the credit (or debit) of their accounts in agreed proportions. In the event of a corporation, this account represents the amount of the issued capital stock, and the profit or loss is carried to "Surplus" account.

Nominal Account.

23. Sales.—Credit this account with the total sales of all merchandise, the charged sales being taken from the total of the charge tickets for the month and the cash sales from the "Cash Sales" column in the cash book. Returns should be charged at selling price for all merchandise returned by customers, whether for cash or credit. The difference in this account will be the net sales, which is transferred to the credit of "Trading Account."

24. Sales Allowances.—Charge this account with any allowance given a customer not contemplated when sale was made. Allowances should not be charged to "Sales," but closed at the end of the period into "Trading Account."

25. Merchandise Purchases.—Charge this account with the face of the invoices of merchandise before deducting cash discounts. The account is also charged with freight, expressage, and drayage on merchandise purchased. Credit the account with any returns of merchandise made to manufacturer or wholesaler and with any allowances for defects in goods received from manufacturer or wholesaler. The balance of the account is transferred to the debit of trading account.

26. Salaries and Wages of Buying Force.—Charge this account with part of salary of proprietor, active partner, and manager or buyer and the wages of office force proportionate to the time given to buying. If, for example, the proprietor estimates altogether that he gave one-fourth of his time to buying and three-fourths to selling, then one-fourth should be charged to this account and three-fourths to "Salaries and Wages of Sales Force." Similarly, the estimated number of hours a week given by any member or members of the office force to buying should be charged to this account.

27. Miscellaneous Buying Expense.—Charge this account with the traveling expense of buying trips and other expense incurred in buying (not covered by account 26).

28. Salaries and Wages of Sales Force.—Charge this account with wages and other remunerations of sales persons, order takers, and all others engaged in sellling, both as regular and extra force; also with the part of the salary of the proprietor, active partners, or manager, and of the wages of the office force proportionate to the time given to selling.

29. Advertising.—Charge this account with all expenditures for advertising purposes, such as space in newspapers and periodicals, space on street cars and billboards, circulars and postage thereon, advertising novelties, trading stamps, charitable donations, window display, electric signs, etc.

30. Miscellaneous Selling Expense.—Charge this account with the cost of wrapping paper, cartons, twine, salesmen's order books, and all other items of direct selling expense not covered by "Salaries and Wages of Sales Force" and "Advertising."

31. Salaries and Wages of Delivery Force.—Charge this account with regular and part time of employees engaged in delivering and with the part of the wages of other employees, whether on sales force or office force, proportionate to the time given to delivery work.

32. Miscellaneous Delivery Expense.—Charge this account with all stable and garage expense, including all repairs, taxes, licenses, upkeep, and with the depreciation charged on the delivery equipment; also charge this account with payments for express, parcel post, and contract delivery service.

33. Management and Office Salaries.—Charge this account with the salaries of the manager, bookkeepers, office clerks, stenographers, and of other general office help not otherwise charged.

34. Office Supplies and Expense.—Charge this account with purchases of stationery of all sorts, account books and forms (except selling and stock forms), typewriter supplies, printing and postage (except advertising), and depreciation on office equipment.

35. Insurance on Stock and Store Equipment.—Charge this account with all expense of insurance, fire, burglary, fidelity, plate glass, employers' liability, and other. This account is not to be charged with insurance on store or business property.

36. Taxes on Stock and Store Equipment.—Charge this account with taxes on all stock and store equipment. As taxes are not payable in advance, the amount charged this account must be credited to "Accrued Taxes."

37. Losses From Bad Debts.—Charge this account with the amount that has been reserved for bad debts (4).

38. Miscellaneous General Expense.—Charge this account with heat, light, repairs, depreciation on store equipment, and with any items that cannot be charged directly to any of the above particular accounts.

39. Rent.—Charge this account with all rents paid. If the store is owned, rent should be charged equivalent to the amount it could be rented for to others, crediting "Income from Other Sources"; in the latter event "Income from Other Sources" should be charged with the taxes, insurance, repairs, and depreciation on the store.

40. Trading Account.—This account shows the inventory of merchandise at opening, and is not touched again until the books are closed. It is then charged with merchandise purchases (25) and sales allowances (24) and credited with sales (23). The inventory at closing is then credited, and the balance will show the gross profit on trading. The gross profit is transferred to the credit of the "Profit and Loss Account." The inventory is then brought down as a new balance.

41. Profit and Loss Account (from Trading Operations).—Charge this account with the balances of all the expense accounts, and credit it with the gross profit from trading; the difference will be the net profit or loss, which is closed into the proprietor's account; if a partnership, to the partners' accounts, according to their several interests, and, if a corporation, to the surplus account.

42. Interest.—Charge this account with all interest paid and credit it with all interest received and close into "Profit and Loss Account."

43. Cash Discount on Merchandise Purchases.—Credit this account with all cash discount taken on purchases of merchandise. The account is closed into profit and loss. A record of such discounts available but not taken—cash discounts lost—will be found of use.

44. Rent Income (Net).—If the store is owned, the rent which has been charged to account 39 should be credited to this account, and it should be charged with insurance, taxes, depreciation, and repairs on store. The account is closed into "Profit and Loss."

45. Miscellaneous Outside Income.—Credit this account with incidental receipts, such as toll from telephone pay stations in store, etc.

FORM C.

May Increase Use of Canadian Timbers at the Front

In an interview upon his arrival at Halifax, N.S., Sir Sam Hughes, when asked about the Canadian forestry battalion in England, said: "I visited the scenes of operations in Devon, at Virginia Water, and other points in England, as well as Castle Douglas, Dalbeattie, Grandtown, Nairn, and Kirkconnel in Scotland, my objects being not only to see the work of the Canadians, but also to observe the extent of the supply, and to consider how Canadian timber products could be utilized at the front. I had previously recommended a committee of leading Canadian lumbermen, representing the different provinces, to co-ordinate the facts and figures regarding the Canadian supply, and arrangements have been entered into, all purely unofficial, with the committee in Britain to see, first, what supplies Canada can furnish, and, second, how they can be gotten to the front. Already it is understood orders have come to Canada in this regard."

Steam Logging by the Aerial Method

By Robert Waddell, Engineering Expert, Washington Iron Works, Seattle, Wash.

I have been asked to discuss high lead logging, but this system is so bound up with others that it is impossible to treat it alone, and I think it best to begin with a brief review of the steps that have led to its adoption.

Loggers are familiar with the methods and appliances of ground yarding, and with their gradual evolution, from the use of horses and oxen at first to that of the modern yarding engine. So I propose merely to call attention to the limitations of this system, and compare it with others.

First: Ground yarding can only be used profitably on the best timber lands, such as flat, bottom lands, with as little underbrush as possible. It cannot be used in swampy ground, nor can it be used for getting logs down hill on steep slopes. (It can, in cases of necessity, be used for getting logs uphill on steep slopes). But, conceding the pick of the timber lands to this system, it still has several disadvantages well known to every logger. Amongst them are: The constant stoppage of the logs being hauled by stumps, etc., the great amount of brush and dirt brought in with the logs, making doubly difficult the work of the men around the landings; the necessity of "sniping" or pointing the logs to expedite their hauling; and the great loss of time caused at each cycle by the changing of the choker hooks to pass the bull block on the way to the landing. (See Fig. 1).

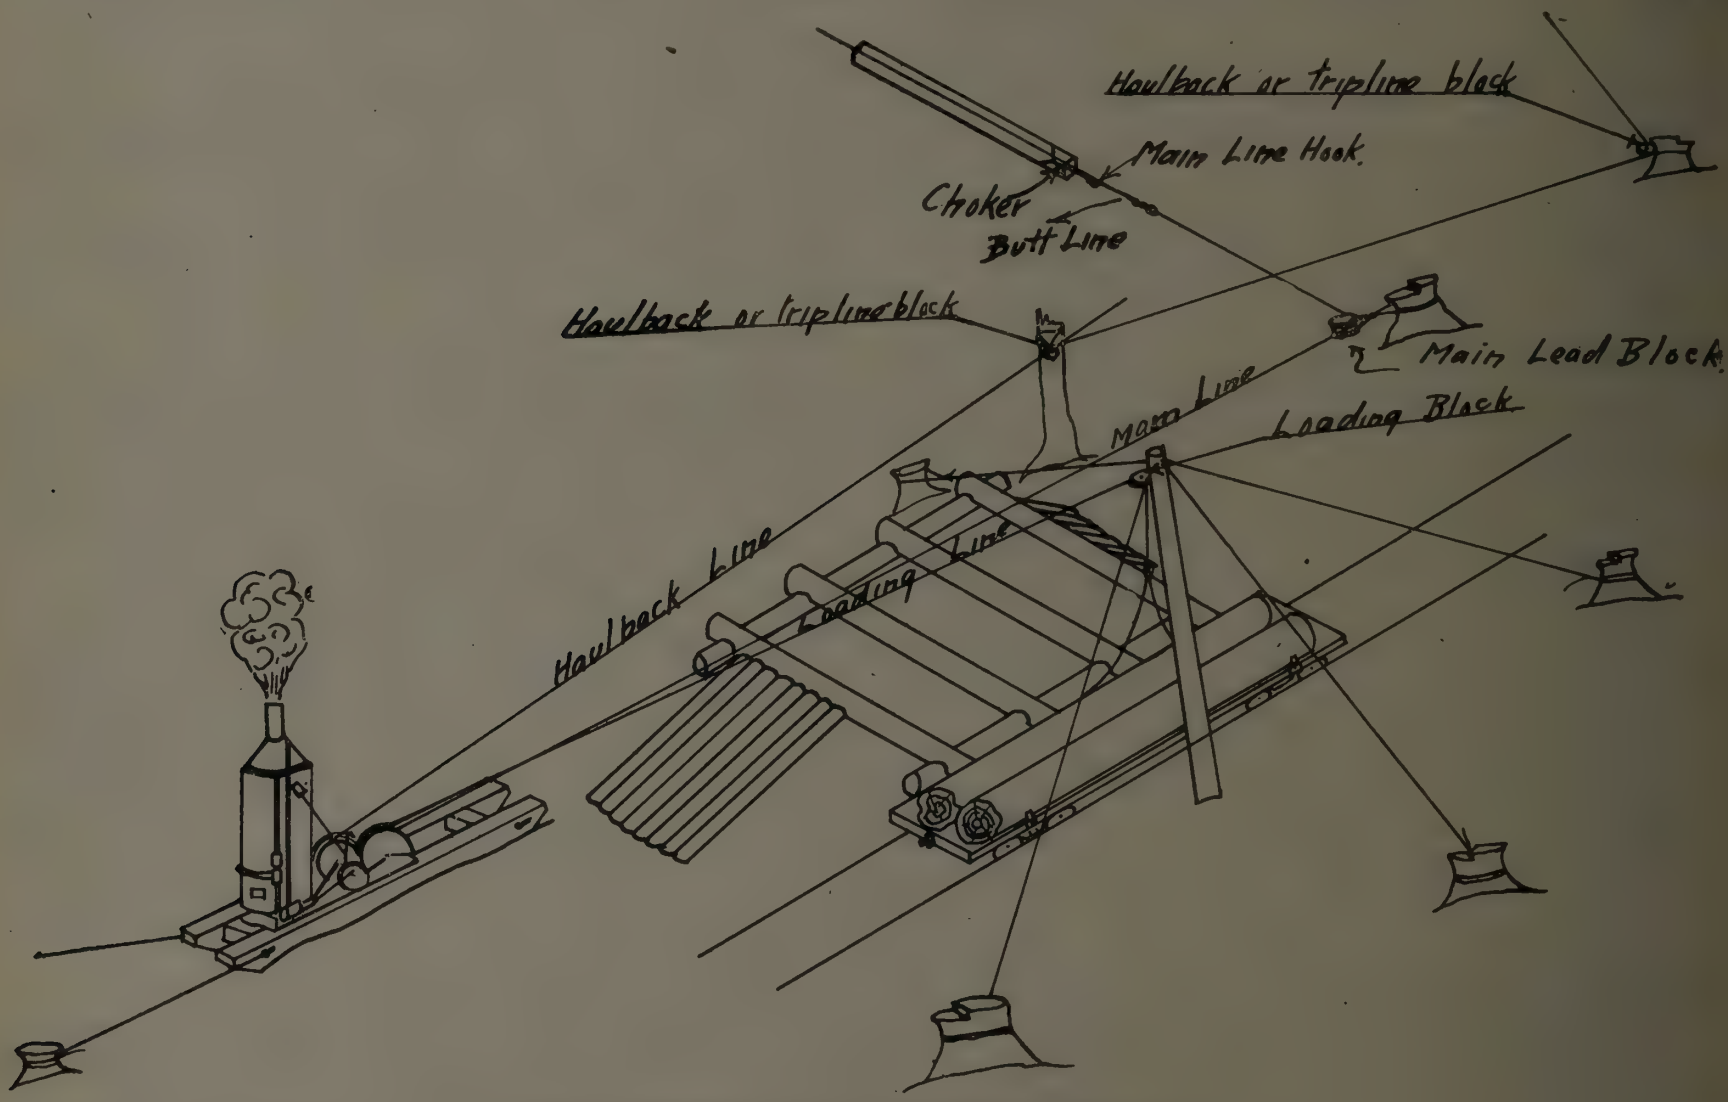

Fig. 1—General Arrangement showing Yarder hauling through Main Lead Block.

Overhead or Skidding Systems: To obviate some of the troubles named in connection with ground yarding, a variety of "Aerial line," or overhead skidding systems have been devised. Nearly all of these employ a "standing line" or "sky line," which is tightly stretched between spar trees at its extreme ends, and which forms the track on which a trolley runs. The log is suspended by one end from this trolley, and is half lifted, half trailed (or skidded) over the obstructions in the ground.

One of the simplest of these systems is the two line skidding system installed by the Washington Iron Works, with whom I am associated, at the Fernie Lumber Company, Fernie, B. C. (Fig. 2).

It is operated by a special three-drum donkey (Fig. 3) but can be almost equally well operated by any two-drum engine, such as a half-breed or road engine, with some minor alterations.

A suitable spar tree is picked out near the railroad track, another at the opposite end of the section to be logged, and a sky line is rigged between them. The engine shown in Fig. 3 has a special third drum for tightening the sky line, which is locked by a ratchet and pawl when the proper tension is obtained; but other and more rough-and-ready methods of tightening the sky line are often used.

On the sky line runs a two-wheeled trolley, made of boiler plate with manganese steel sheaves, and provided with a block hung to the underside of it. The yarding or skidding line is led from the skidding drum of the engine up the head-spar through a block, out through the block under the trolley, and ends in the hook for engaging the "Chokers" on the logs. The trip or haulback line is led from the trip drum of the engine out through the woods, through a block on the tail spar, and out to a shackle on the trolley. By pulling in this trip line the trolley is run out to the woods to the desired location, the skidding line is slacked out, hooked to the log, and then hauled in, bringing the log with it. Logs can be yarded from a limited distance each side of the sky line, and when this space has been cleared, a new tail spar must be picked and the line moved.

It is plain that, for any considerable span, the weight of the bight of the skidding line hanging between the trolley and the headspar must make it difficult if not impossible to "get slack," that is, reeve off enough line to enable the hook to reach the log. A tag-line is therefore attached to the hook, and by hitching this to some convenient stump momentarily, slack may be pulled as desired up to a radius of 1,000 feet, but for greater distances it is advisable to use intermediate supports for the sky line, and a special opensided trolley must be used to pass the hangers. This system is at its best on comparatively level ground or slopes of not more than thirty per cent. in small timber of from 200 to 500 feet to the log. Variations of this system are the North Bend system (Fig. 3) and others, but the essential principles are the same as described. The capacity per day may average 30 to 35 thousand, even in such small timber, and the speed of line used is commonly about 500 to 600 feet per minute.

Lidgerwood, Hawthorne and Other Interlocking Systems

I have already spoken of the limitations of the two-line aerial system, notably as to span, slack pulling, and grade of slope. To over-

come some of these troubles, several more powerful (and also more complicated) arrangements have been devised, the most notable being the Lidgerwood (Fig. 4) and the Hawthorne. Both of these systems employ the sky line as I have already described it, the skidding or yarding line, and the trip or haulback line, but both have in addition a slack-pulling line by which the skidding line is reeled out to the hook tenders regardless of the size of the span or weight of line. In the Lidgerwood system slack is pulled to the trolley, and carried out by man power from the trolley to the log, while in the Hawthorne system slack is pulled to a portable trip block, which is hitched to a

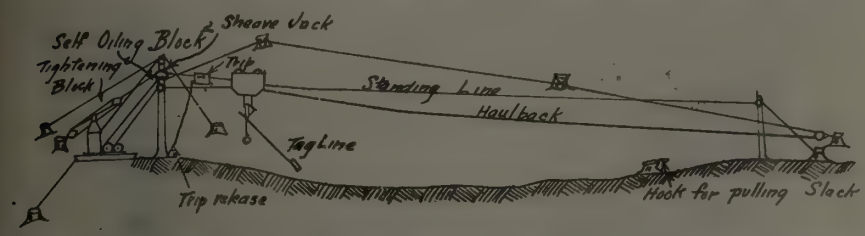

Fig. 2—Two Line Skidding System installed by the Washington Iron Works at the Fernie Lumber Company, Fernie, B. C.

stump near the logs to be yarded, thus eliminating all handling of the line by the crew. The most notable feature of both systems is the interlocking of the skidding and haulback drums on the engine, whereby the skidding line comes in at exactly the same speed as the haulback line goes out and the tension on the two lines is maintained without the use of brakes. This feature enables the rig to be used for downhill yarding on the steepest hillsides, for crossing swamps, ravines and other natural obstructions, all with the minimum expenditure of power.

The Lidgerwood skidder is usually mounted with its own log-loader just ahead of it, on a steel flat car, both engines taking steam from the same boiler. The car is provided with four hydraulic jacks at the corners, by which it can be set up on blocks, or "crabbed" sideways off the railroad to its own setting at the foot of the spar tree.

These systems are at their best among moderate-sized timber, and for spans up to 1,000 feet, although spans of 1,500 feet and more have been successfully operated. The average capacity in favorable circumstances may reach 50, 60 or even 70 thousand feet per day per machine, in Puget Sound forests, and the line speed may be from 400 feet to 800 feet per minute.

MacFarlane System: This overhead system is notable more from its originality than from its popularity, as there are very few in use.

There is the usual head and tail tree, but the sky line instead of being fixed is wound on the skidding and trip drums of the engine, and the whole span is raised, lowered, or traversed as would be the skidding line in the ordinary system. This feature, as you can see, entails a very massive design of engine, with large drums and very powerful brakes; and the operation of such a quantity of heavy cable makes the work of the woods crew more precarious. I have seen much time lost by the crew "bolting" into the woods after hooking a log, and having to return a corresponding distance to replace the chokers when they slipped.

High Lead System: I have mentioned the MacFarlane system

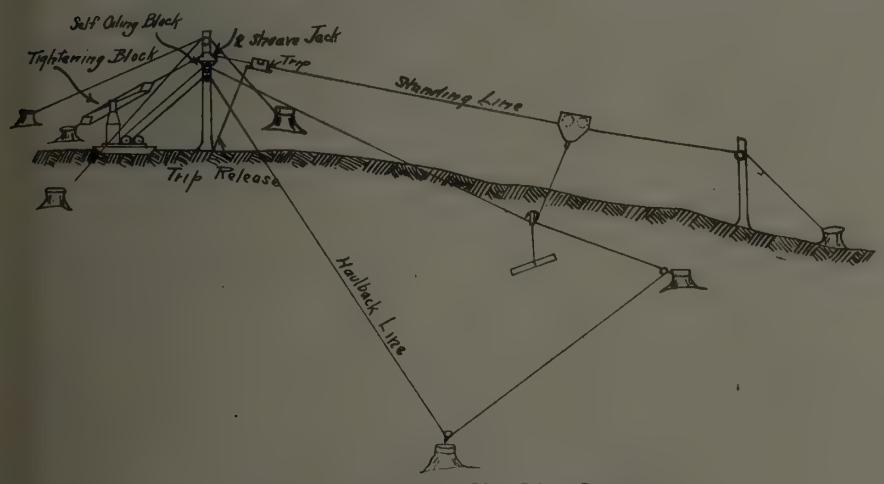

Fig. 3—North Bend Sky Line System.

more because it marks a step in the evolution of the High Lead than for any particular merits it possesses. Its principal weakness, as I have said, is the great size of drums and brakes to keep such a tension in the lines as will lift the log off the ground. But if we were to make no attempt to keep the log off the ground, this objection would vanish, and we should then have evolved, to all intents and purposes, the high lead yarding system.

It is a little difficult to describe the rigging and method of operation without the aid of diagrams, but I shall try to put matters as lucidly as possible. Suppose we choose a spar tree near our railroad track, as high a one as possible, and cut the top hamper from it. We then attach guy-wires all around to convenient stumps, using from four to nine, according to the height of the tree. At least two of these guys must cross the railroad, to be used for loading. To the top of the spar tree we attach the high lead block, which has been designed specially for this work, and takes the place of the old bull-block. It is built with large diameter sheave, and large oil reservoirs in the side plates. This block is commonly from 100 to 180 feet from the ground, so it is essential that it should hold enough oil to last about a week at least.

The weight of the block may be from 700 to 1,300 pounds, depending on the size, and the greatest care should be taken to see that the straps and rigging that support the block are strong enough, and well put on.

The yarding donkey may be set in any position from right against the spar tree to 150 feet away from it—the latter position is the safer if any accident happens to the rigging. From the main drum of the donkey the line is led up through the high lead block and out into the woods, while the trip or haulback line may be led in the same way, or along the ground if preferred, to the trip block which is attached to a convenient stump.

The logs are pulled from every direction radially towards the spar tree as a centre, and are dropped promiscuously in a pile at the base of the spar. It would be impossible with this system to pull the logs to a landing (unless a separate donkey were used for the purpose) so no attempt is made to arrange the logs parallel to the track. The pull on each log as it is being yarded, comes from the top of the spar, which tends to lift the front end of the log over any obstructions, and makes an enormous difference in the speed and ease of yarding. Also, there is no sniping or pointing of the logs required, and the condition of the logs reaching the mill is greatly improved by the absence of stones.

I have it from mill men that the trouble from stones in the logs is only one-tenth as great with the high lead as with ground yarding, and this makes a very considerable saving in the upkeep and life of the

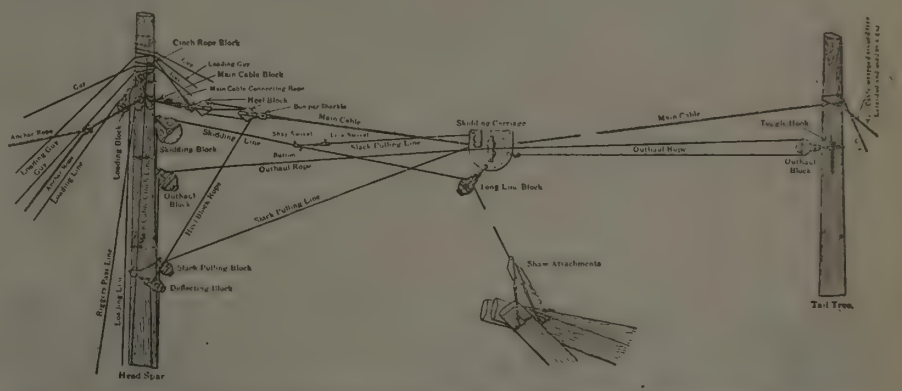

Fig. 4—Lidgerwood Interlocking Slack-pulling Cableway Skidder and Loader.

saws. A great deal less brush and mud is also pulled in with the logs from the high lead system, which makes the work of the loaders much more tolerable.

The capacity of an ordinary compound geared yarding donkey is commonly increased from 15 to 30 per cent. by the change from ground yarding to high lead yarding, but the full benefit of the high lead can only be realized by using a machine capable of higher line speeds. For this reason the firm with which I am associated have put on the market the Simplex Yarder, a long stroke, direct geared donkey, having considerably higher line speed than the ground yarder, yet powerful enough to be used for ground work if required. Line speeds for ground yarders vary from 200 to 270 feet per minute, and for Simplex yarders from 300 to 350 feet. The haulback drums have been correspondingly speeded up, as it is just as important to get the line out into the woods quickly as it is to get home the log. With modern "Simplex" yarders it has been found quite possible to average from 100 to 125 thousand a day, and in one exceptionally favorable situation 200 thousand a day has been yarded.

These great capacities of the yarder have necessitated a corresponding speeding up of the loading facilities, for it is no use yarding 125 thousand if your loader can only get rid of 60 or 70 thousand a day. The difficulty is rendered greater by the logs coming in promiscuously, and lying across each other in a heap at the base of the spar tree, so that ordinary loading engine has no chance of loading even half the output of the yarder. As far back as 1910, the Washington Iron Works designed and built what they called a "Duplex" loader; from the fact that it consisted of two entirely independent and similar units, which handled both ends of the log simultaneously with two loading lines; and this engine has proved to be the one touch necessary to complete the success of the high lead system. The machine consists of two nine by ten and one-quarter double cylinder reversible engines, mounted one above the other, each driving a loading drum directly bolted to its gear, An extra drum is provided on the lower engine for car spotting, but the essential feature of the loader is the driving of the loading drums without the use of frictions, and the

reversibility of the engine to do away with the use of brakes and haul-back lines.

When I described the rigging of the spar tree, I mentioned that two at least of the guy wires should pass across the track, to be used for loading; and I shall try now to make this part of the system clear. On each of these two guy lines crossing the track is mounted a small two-wheeled trolley, or "loading jack," which is anchored, by a tag-line from the spar tree, so as to hang directly above the track. To the underside of each loading jack is suspended a loading block (preferably of the oil-reservoir or auto-lubricating type) and on the spar tree itself, at a point some distance below the high lead block, are hung two more loading blocks. The loading lines are led from the two drums of the loader up the spar tree, through the two blocks on the spar, and down through the blocks on the loading jacks. At the end of each line is fixed a set of tongs (which must be of high tensile steel) by which the log is lifted.

Two men take each one of these tongs, and run out to the pile of logs, slack being paid out to them by steam. If only one end of the log to be loaded is accessible, that end only is caught by a pair of tongs, and the whole log pulled out of the pile by one loading line. As soon as the other end is clear, the other pair of tongs is hooked in, and the log can then be pulled along, one end at a time or both together, till it comes to the side of the track. It is then lifted bodily, and hangs from the jacks, parallel to the car, and directly above it, from which position it can be lowered gently on to the car. This method of holding the logs by both ends makes the operation of loading logs at least twice as rapid as the older plan, and is at the same time much easier on the cars.

With this machine we have found it easily possible to load four cars per hour, working from the pile delivered by a high lead yarder, and this output is far beyond the capacity of the yarder.

To complete the description of the high lead system, I should like to refer to a special combination of high lead yarder and loader which we have furnished several firms with, amongst them the Cherry Valley Timber Company, Stillwater, Washington, and the Everett Logging Company, Tulalip, Washington (Fig. 5).

These rigs were designed for camps possessing very complete railroad facilities, and consist each of a Washington Simplex Yarder having an extra large boiler, a Washington Duplex Loader, without boiler, taking steam from the yarder boiler, both being mounted on a steel flat car. The flat car is specially constructed for the purpose, having trucks that will swivel all around the circle, and being provided with four 6-inch hydraulic jacks, one at each corner, supplied from a pump driven by the loader. The loader is at the front end

Fig. 5—Complete High-Lead Unit Consisting of Washington "Simplex" Yarder and "Duplex" Loader (Patent applied for) with oil burning equipment, mounted upon special steel car with swivel trucks. In operation at the Cherry Valley Timber Company's Camp, Stillwater, Wash.

of the car, the yarder in the middle, and at the back is a large oil and water tank.

This combination has many advantages over the separate machines on sleds, where the railroad facilities are ample. A setting can be very rapidly changed, far more rapidly than where the donkeys are on sleds and have to pull themselves along, as the whole car can be crabbed on to the railroad by the same method as I described for the Lidgerwood, and then pulled by the locomotive to the new setting. I have with me two excellent photos of the rig at the camp of the Cherry Valley Timber Company, Stillwater, which I shall pass around. The rigging of the spar tree is very clearly shown, also the loading jacks and blocks with the log hanging from them (Fig. 6).

I believe I have described the essential features of the various methods of handling logs as fully as I am able in a limited time, and without the aid of diagrams or views; but there are still some facts and figures on the cost and performance of some of them that you might care to listen to. I give them with due reserve, as every practical logger has his own idea as to the cost of operating, and is inclined to doubt the figures given by a competitor.

First, a comparison of the cost of building a landing for ground yarding, and rigging a spar tree for high lead yarding shows that the landing may run from one hundred and fifty dollars up, while the spar tree works out at about sixty dollars. In cases where two sides are yarded, one spar tree will take the place of two landings, which makes the comparison sixty against three hundred, and the cost

Fig. 6—High-Lead Yarding at the Cherry Valley Timber Company's Camp, Stillwater, Wash.

about ten cents a thousand for the loading, and two cents for the spar tree.

In this estimate I have taken not merely the cost of the actual landing, but the whole cost, including blasting, as the stumps must be removed and the road cleared for ground yarding at the landing, which is not required for high leading.

Next, as the time required to string out lines. Once the spar tree is guyed, it takes about an hour and a half to string out the yarding and loading lines for the high lead system, and about the same for ground yarding. For the overhead system, such as the Lidgerwood, the Hawthorne or others, considerably more time is taken, as there are at least two extra lines, and one of them, the sky-line, has to be set up tight.

The actual figures covering four years working on the Merrill & Ring Logging Company, Washington, give a daily average capacity of forty thousand for the ground and an increasing average of fifty to seventy-five thousand for the Lidgerwood and high lead systems, these two being in this case about equal in efficiency. I may say that the timber is fairly small, running about five hundred feet to the log, so the case is more favorable to the Lidgerwood system than it would be with larger timber.

The comparative costs for the three systems, obtained from the same company, give (all in cents per thousand) for the ground yarding 120 cents, labor only, Lidgerwood 91 cents, labor only, and high lead 81 cents, labor only. For ground yarding upkeep of engines only 12 cents, high lead upkeep of engines, 12 cents, and Lidgerwood upkeep of engines 9 cents. For ground yarding cost of wire only, 11 cents, for high lead 14 cents and Lidgerwood 13 cents.

Again, in commenting on these figures, I may say that the yarders used for high leading were old fashioned ground yarders, of a nearly obsolete type, and the Lidgerwood machine was absolutely modern, so that the upkeep charges show very unfavorably to the high lead system. This upkeep charge is more than double what is given by other firms employing up-to-date machines. Taking these figures as a basis of comparison, we see that the total cost is slightly in favor of the high lead system, whilst both the Lidgerwood and the high lead systems are far ahead of the ground yarders. Both the Lidgerwood and the high lead are delivering from 25 to 75 per cent. more logs at about thirty per cent. less cost per thousand feet. From Mr. McDonald, at the Cherry Valley Timber Company, I have received practical confirmation of the relative efficiencies of the ground and high lead systems that I have just quoted, and for the cost of wire he gives 15 cents per thousand for the ground system and 10 cents a thousand for the high lead system.

Opportunities in South America

United States Investigator Tells of Lumber Markets and How to Get Into Them More Extensively

The West Coast Lumbermen's Association, at its monthly meeting on Sept. 29th, had the privilege of hearing an address by Roger E. Simmons, special investigtaor for the Bureau of Foreign and Domestic Commerce, who recently studied lumber trade conditions in South America. Mr. Simmons referred at considerable length to the markets for Douglas fir. There was an erroneous impression, he said, to the effect that South American business men possess little intelligence and low business ideals. On the contrary, their standards will compare very favorably with those of this country. A characteristic for which South American business men are noted is their loyalty. Mr. Simmons said: "Secure confidence by open, square dealing, protecting the interests of your clients, and you will find South American patrons upon whose loyalty you can depend. The personal equation enters largely into business. Friendship and loyalty comes in return for service." In speaking of the class of dealers engaged in the lumber business, he said that the yards are always located on important streets, all lumber is stored in enclosed sheds, the buildings are imposing and of good character, and are not located on the outskirts of the towns. Some sheds have sufficient room to accommodate 3,000,000 feet, and in times of normal business imported stocks of lumber totalling over 200,000,000 feet are carried on the southern continent.

Despite the fact that the forests of South America are vast and contain great quantities of timber, Mr. Simmons said that American manufacturers do not have to fear the competition of native woods greatly, because the species are so scattered in the forests, are so expensive to log and manufacture, that the price is extremely high and will allow the payment of large import duties on foreign wood. The only wood that occurs in thick stands is classified as a softwood in Brazil, and is variously called Brazilian white pine, Parana pine, or Araucaria. It produces an inferior type of lumber, much subject to warping and twisting, and is very susceptible to the attacks of fungi. Consequently it is not to be greatly feared as a competitor of American woods.

Mr. Simmons said that the high import duties on rough lumber are imposed by the governments in the hope of helping local manufacturers of lumber, but, instead of accomplishing the desired result, they are causing the people to run largely to the use of substitutes for wood in building construction. The duty on surfaced lumber is prohibitive, and he believes that the interests of the American lumbermen may be served by exporting cut-to-size stock for stiles, rails, panels, furniture stock, and car material, etc., in the rough, so that the remanufacture may be accomplished by local industries of the countries to which the exports go. He said that while all of the countries of South America present possibilities for the increase of the exportation of lumber, he believes that none afford the opportunities of the section termed the "River Plate." This district is termed one of the largest, if not the largest, import markets for lumber in the world.

Douglas Fir Shipments.

In speaking of the opinion regarding Douglas fir caused by the method of handling exports, Mr. Simmons said that no complaints have been made as to the grades received, the volume of the cargoes, or the manner in which they have been prepared for shipment. He complimented the West Coast lumbermen by saying that is the only instance in which the South American dealers are perfectly satisfied with a wood imported from the United States and their treatment by the exporters. In speaking of the inspection of shipments, he said: "The result of your wisdom in estabilshing an inspection bureau and taking steps to transact export business on a standardized and business-like basis is especially apparent in Chile, where Douglas fir in the face of competition of the chief native woods is meeting over half of that republic's demand. To my mind, this is the most notable achievement of American trade in South America." To put Douglas fir on the same satisfactory footing in the Plate market it is only necessary to employ the same principles that have built up such a large trade in Chile and Peru. The importers, who are the principal lumbermen, carry enormous stocks, and frankly say they will oppose the introduction of a wood, such as Douglas fir, that will force them to carry duplicate stocks of two woods suitable for the same building purpose, Southern yellow pine occupying the position of standard stock lumber. As both woods are usually quoted at about the same figure, the price factor will not exert any influence. Mr. Simmons says the situation as it stands does not appear promising for Douglas fir, yet he suggests that the West Coast lumbermen can open up a large and profitable market by active co-operation of all the manufacturers and the organization of export selling agencies. How this may be applied to increase the market is best told in his own words: "Through co-operation and export selling agencies you are in a position to arrange with one of the principal importers in the Plate section for the placing of a cargo of Douglas fir on consignment, to be paid for as it is sold. A salesman with a knowledge of the merits and properties of Douglas fir should follow the shipment to the Plate and work with and under the guidance of the importer. If the trade becomes interested, as undoubtedly it will, importers will not seriously object to the innovation. Such a plan would not interrupt present business relations nor oppose customary system of procedure, while it provides for placing the wood on the market for examination." He said that he did not believe that the establishment of local yards stocked with West Coast woods in the Plate district would be a successful way in which to introduce the woods, both because of the enormous costs that would have to be sustained by the importers and the natural prejudice of the trade.

The importers of Chile, like those of the Plate section, have strong and effective organizations, a good knowledge of trade conditions and credits. By organized effort they have developed the lumber business to its present magnitude, and intend to protect and maintain their advantages. As in Argentina, there is a market for an increased sale of Douglas fir, but, according to Mr. Simmons, the best manner in which to increase the trade is not by becoming interested in local lumber distribution, but by the co-operation of American exporters with Chilean importers in an educational campaign to enlighten the people as to the proper uses of wood. He says: "An educational campaign is the imperative need in Chile, but more so in Peru, and of equal importance in Argentina, Uruguay, and Brazil, where it is necessary that the people be informed how to use and what woods to use; that proper seasoning will prevent shrinkage, warping, and in many cases decay; that woods can be treated to prevent rot when exposed to dampness and also made fire resistant; that wood does not contract or expand with the temperature, and that it does not hold heat or cold as steel does, and that painted lumber in the open will probably utlast galvanized iron.

Regarding other possible markets for Douglas fir, Mr. Simmons said:

"In Brazil there exists an immediate opening for marketing a softwood to substitute for Swedish pine, this lumber to be brought to Brazil only in the form of deals, 3 x 9, 14 to 18 feet long. The quantity used ranges from 10,000,000 to 15,000,000 feet annually. With the outbreak of hostilities in Europe the supply of this Swedish lumber has eeen practically cut off. The American wood that will successfully meet requirements at proper prices will not only find immediate demand, but doubtess a permanent trade in the future.

"It is well for manufacturers of Douglas fir, with the operation of the Panama Canal, to look to the possibilities of trade with Venezuela, where lumber is admitted free, provided it arrives in sizes no less than 12 x 12 random lengths, varying from 16 to 40 feet. Douglas fir is more readily applicable to these sizes than any other American wood, and for that reason West Coast mills should not overlook Venezuela's markets.

"Lying off the coast of Venezuela is the Island of Trinidad, owned by England. Over 10,000,000 feet of American lumber is consumed there annually. Recently a consignment of Douglas fir salvaged from a wrecked vessel nearby was brought to the island. It was the first time the wood ever appeared in that market. It made a favorable impression, and doubtless after the war enquiries for quotations will be asked, with prospects of this lumber becoming a market standard."

In concluding, Mr. Simmons said:

"Increased sales for United States lumber in South America can be said to depend, first, upon filling orders with lumber properly conditioned, accurately measured, and uniformly graded; secondly, trade extension by publicity and demonstration.

"Nothing can further these factors to greater advantage than the co-operative export selling agencies that you propose to organize. Nowhere is co-operation among lumbermen more essential than in the development of foreign trade. I am sure if American lumbermen are to make the most of the great opportunities that are before them in South America they must at once perfect organizations which can successfully not only seek foreign business, but can study to take care of its proper transactions in such a way as to be satisfactory to foreign purchasers and to reflect favorably on our lumber industry and the American business character."

A cable from Great Britain states that Col. Pelletier, agent general for Quebec, recently left for Canada to assist with arrangements now in progress for the development of Quebec timber lands in the special interest of returned soldiers. Two Engilsh groups, it is reported, are subscribing one million dollars each for the purchase of timber lands, which will be cleared of pulp and other wood and then thrown open for farm settlement on easy terms.

P. P. Clark, ex-warden of Hastings County, Ont., died at his home in Belleville recently, after several months' illness. The late Mr. Clark spent most of his life in St. Ola, where he was engaged in the lumber business, owning a sawmill and conducting a general store.

Imports of timber, hewn and sawn, into New Zealand, during the seven months ending July 31st, were valued as follows:—1916, £73,576; 1915, £167,864.

Lumber Experts Going to Europe

United States Government and Lumbermen Co-operate to Study Foreign Trade Opportunities

The United States Bureau of Foreign and Domestic Commerce of the Department of Commerce have examined a large number of lumber experts in order to find the most suitable men to engage in an investigation of European lumber markets, in accordance with a plan recently decided upon by the National Lumber Manufacturers' Association, the Federal Trade Commission, the United States Forest Service, and the Bureau of Foreign and Domestic Commerce. Those who passed the examination with the most credit will be given an oral examination at Washington, before a board composed of representatives of the lumber industry and the officials of the three government branches concerned.

In regard to the investigation, Dr. E. E. Pratt, chief of the Bureau of Foreign and Domestic Commerce, has made an announcement to the following effect: Five trade commissioners are to be chosen, who will be specially qualified to secure and report detailed information about the requirements of European lumber consumers and the methods and capacities of European lumber producers. All the expenses of one commissioner will be paid by the government. The cost of the others, including the services of a Russian interpreter, will be borne by the National Lumber Manufacturers' Association. All will be appointed by the Department of Commerce.

Before the end of November the commissioners appointed will be holding conferences with manufacturers throughout the country, so as to ascertain precisely what information will be of greatest value to them. After this the commissioners will leave for Europe.

One commissioner will study lumber requirements in the United Kingdom, Holland, and France. A second will cover Southern Europe and Northern Africa, including Spain, Italy, Greece, Algiers, and Egypt. A third will study conditions in the Central Empire, covering the markets of Germany and Belgium, and perhaps those of Turkey, and the production of Southern Germany and Austria. A fourth commissioner will go to Norway and Sweden, to make an estimate of the lumber-producing power of those countries. A fifth will study conditions in Russia, Siberia, and Roumania.

The investigation is to be one of the most thorough ever undertaken, and may extend over two years. It is expected that by the end of the war enough information will have been collected to be of assistance to American manufacturers who are then ready to handle European trade.

The commissioners will be expected to have a thorough acquaintance with American woods, their varying qualities, the uses for which they are best adapted, the dimensions and grades in which they are usually marketed, and the woods that compete with them. They will make a complete study of the European building trades, and of the kinds, qualities, and dimensions of lumber that are most popular for all sorts of construction—in fact, they will study every variety of market in which the American lumber exporter is interested.

A special study will be made of the furniture trade, the methods and requirements of cabinet-makers and carpenters, the use of American oak, gum, and other hardwoods, and the demand for soft and hard varieties of these American woods. The names and addresses of lumber importers, large users, etc., will be furnished, together with the character of their supplies.

In the course of his announcement Dr. Pratt said:

"The destruction of European forests resulting from the high price of coal and the ravages of war will undoubtedly increase the demand for the lower-grade mill products, and thus afford an outlet for much material that is now in this country, either wasted outright or wasted in part by being put to an inferior use, as once black walnut was used for fence posts and cross ties. The possibilities of building up a market for this part of the tree will be particularly studied.

"If we are to do business with Europe successfully to-morrow, as well as to-day, it is important that we know what our chief competitors are doing, and for this purpose investigators are going to Sweden and Russia. They will make estimates of the timber stands of those countries, the means that are being developed to insure a steady supply of good lumber, the cost and methods of logging, the efficiency of the sawmills, the methods of selling and delivering the finished product, and the general competitive power of those countries.

"During the progress of their investigations the commissioners will make preilminary reports on the more important phases of the work, and these reports will be bulletined at once to the lumber associations and distributed by them to their members. On their return, they will tour the country, according to the usual practice of the bureau's special agents, advising with the lumber manufacturers as to the most profitable opportunities in European markets.

"The fact that the United States lumber producers have been exporting to Europe some $50,000,000 of wood and its manufactures annually is the best evidence of the future market that waits the lumbermen across the sea."

Organization of American Lumber Industry for Export Trade

The information brought out at the recent conference between United States Government officials and representatives of the American lumber trade, briefly summarized, is as follows:—

Belgium.—The forests have been entirely destroyed and the nation so wrecked physically and financially that it will have to be entirely rebuilt, and this rebuilding will have to be financed by the Allied powers.

Northern France.—Northern France will have to be entirely rebuilt. A great deal of railroad construction will have to be undertaken; so much indeed that it is said the number of ties, sleepers and timbers is beyond estimate at the present time. This same condition holds true with regard to the farm buildings, villages and cities of the section. This need will be definite, regardless of the outcome of the war.

England.—The forests of England and those of Scotland have been almost entirely cut in an endeavor to secure material needed at the front and for building construction brought on by the war. Lumber will have to be imported for practically all future building until new forests grow to take the place of this timber.

Italy.—The supply of Italian timber has been almost entirely used either in Italy's war operations or exported for the benefit of the allies. It is said that great quantities of lumber are in immediate demand.

Spain.—Because of the geographical situation Spain has been called upon to supply lumber to the warring nations, with the result that all marketable timber has been cut.

Germany.—So far it has been impossible to secure any estimate upon the conditions of Germany's timber, but it is known that it has cut as much timber as possible from the invaded portions of France, Belgium and Russia and has conserved home resources as much as possible. However, it is expected the demand from Germany for foreign lumber will also be very great.

Russia.—The supply of standing timber in Russia is very great, both in the Baltic Provinces and in southern Siberia, but owing to the lack of development of the timbered sections and poor transportation facilities the timber will not be available to the Allies for some time after peace is declared. Much development work will have to be done before Russia takes a dominating position in the lumber world.

How to Secure These Foreign Markets

To secure this business, it was declared to be necessary only for the American lumbermen to go after the trade systematically, with an advance knowledge of the needs of the various nations, and the securing of information as to markets and business practices. It was stated that the French Government has already offered to buy enormous quantities of railroad timber on twelve months' interest-bearing notes.

The Government called this conference in the belief that it was a function of the Bureau of Foreign and Domestic Commerce to assist the lumbermen to develop this market efficiently and the lumbermen voted to join in the movement by partially financing the expenses of trade commissioners to proceed at once to Europe and begin gathering information. The method of working out the underwriting of this expense was left to a committee.

The most illuminating exposition of conditions abroad was made by John E. Rhodes, secretary of the Southern Pine Association, which sent a representative abroad several months ago, and whose reports, already fragmentarily at hand, show that the demand for lumber will be beyond belief. France, it was shown, as well as other foreign powers, is strongly prejudiced in favor of American lumber. The plan of rebuilding France, as being outlined by French governmental authorities, is to have towns and villages on the community basis, with model farms on the American plan. The picture of utter devastation presented by Mr. Rhodes, as part of his showing of the opportunities for American lumbermen, was striking. It so impressed the representatives of other lumbering regions that they agreed that it was time for American lumber manufacturers of all sections to unite to care for this great market, regardless of whether the interested districts themselves were exporters or not.

Hull Merchants Want Canadian Stocks

Timber merchants at Hull, England, continue to manifest interest in Canadian timber, but state that it is now impossible to arrange for shipping space from Canada. One Hull firm largely interested in maple floorings and blocks writes that within the past two years they have bought about £12,000 worth of maple floorings from the United States and £1,500 from Canada, and now have orders placed in the United States for £4,000. They state that American firms, although handicapped by ocean space shortage, are yet managing to make deliveries, though this has proved impossible in the case of Canadian firms from whom they endeavored to secure supplies, the latter reporting that the steamship companies have refused all business in this commodity both to Liverpool and to Manchester.—Weekly Trade and Commerce Bulletin.

From the Canada Lumberman of Thirty-five Years Ago

BLACK WALNUT.—A Gloomy Outlook for Furniture Men.—A few years ago black walnut was a drug on the market, and was not at all popular with furniture manufacturers and dealers, but recently it has been so universally sought for and used so extensively for almost every kind of furniture that latterly it has become very scarce, and now it is found next to impossible to obtain a sufficient supply to meet the increased demand, at almost any cost. An idea of its scarcity and value may be gained when $100 per thousand feet has been paid this year for the same quality and quantity of black walnut as could be purchased last year for $70. The rapidity at which the supply has decreased is owing to the impetus the trade has received through the organization of a large number of extensive furniture companies in the United States. The immense number of sewing machines (the wood-work of which has been manufactured from black walnut) that have been annually turned out, both in the States and in Canada, is one of the principal causes of the rapid consumption. A prominent dealer in the city states that there are now ten anxious buyers distributed throughout the States to every one there was two years ago, and that there is more difficulty in procuring a few thousand feet of the precious lumber now than there was in securing half a million feet three years ago. When walnut first came to be used it was obtained from Port Stanley, the Counties of Kent, Essex, and South Middlesex, and it also grew in abundance on the banks of the Thames River, Ont.; but now the Canadian supply is exhausted, and lately it has been obtained from the State of Indiana. There was such a great similarity between the wood of the two countries that manufacturers had no choice and paid the same price for either. Since the Canadian supply has failed, the immense drain on the forests of the State of Indiana has caused the supply to give out there, and now the walnut (which is of a lighter shade and consequently not so good) is obtained from the States of Arkansas, Kentucky, Kansas, and South Tennessee.

If walnut is not replanted at once the outlook for good furniture in the future will be very dreary. If it were planted along the shores of Lake Erie or in the counties before mentioned, or in any part of the province west of Ontario, in twenty years' time it would pay 5,000 per cent., so says an old arboriculturist. In the meantime the prospect is gloomy in the extreme, and dealers look forward to a speedy and complete exhaustion of the supply.

Editor's note.—The above was written 35 years ago. It is interesting to note that the recent revival of interest in walnut as a furniture wood has been met by the appearance of plentiful supplies from United States manufacturers. First and seconds one-inch walnut is worth to-day about $120 a thousand feet, without the duty. A Canadian consumer, paying the duty, would be able to get as much walnut as he wants at about $129 a thousand feet.

M. J. Scanlon's Views on the Western Situation

M. J. Scanlon, of Minneapolis, vice-president of the Powell River Company, Ltd., British Columbia, in a recent report regarding the future of the lumbering industry of Western Canada, said: "There are several things that are acting against the lumber industry in the West, one of these being the scarcity of tonnage to carry the lumber, and then there is the fact that the demand from Mexico is not so great as it used to be. Then British Columbia has to reckon on the competition from the East, which is becoming a formidable factor. The people of the United States would use more British Columbia lumber were it not for the fact that we cannot get the class of lumber we require there, and also that the freight rates are so high. That leaves us only one alter- also that the freight rates are so high. That leaves us only one alternative, and that is to place our orders in Eastern Canada. I do not mean to say that we have abandoned British Columbia as a lumber-producing centre. Far from it, but what I wish to convey is that at the present time, under conditions due to the war, our business connection with British Columbia is not so great as we would like it to be, though that, of course, is bound to right itself. If the United States building permits have gone up by leaps and bounds, and we have to get lumber somewhere, we take it from the nearest and cheapest place. After the war a different state of affairs will arise. The forests of the Eastern States are being rapidly depleted of their supplies, while all the time British Columbia is building up a supply that must of necessity be used by manufacturers and others, not only in Canada, but in the United States as well. At present there is only about 35 per cent. of the capacity of the sawmills in the States in operation, and the same thing applies to Canada. There has been overproduction in both countries, and that overproduction is still going on, though not to the same extent as formerly. My opinion is that when times get normal, when matters are settled in Mexico, and when the war in Europe is over, there will not be sufficient lumber to take care of the orders that will flow in. Of course, Europe will look to America for a large supply for reconstruction work and then will come a time of prosperity for both countries. The one great handicap that we are up against in the United States is the labor situation. There is a scarcity of labor, and there is no question of that, and until the war ends there will continue to be a scarcity. Before the war started we were getting 1,200,000 immigrants yearly. The war has been on two years, and that makes 2,500,000, and you can easily understand the effect this is having on the abor market."

B. C. Lumbermen Want More of Australian Market

The royal commission to discuss the best means of extending the Empire's trade has an appointment to sit in Vancouver, and the shipping men, together with lumbermen there, propose to lay before it the advisability of doing something to overcome the disadvantages under which British Columbia lumber mills operate. The chief drawbacks are lack of tonnage and the higher cost of production in British Columbia than in the United States. E. W. Hamber, a director of the Dominion Bank, and also closely identified with the lumber interests, discussing the subject recently, said that naturally the question as to why so much of Australia's business goes to San Francisco when the supplies of Douglas fir in British Columbia are so vast and so accessible presents itself, and leaves the impression that the mills at the coast are not under management as effective as are those in the neighboring states, which supply 228,672,576 out of a total of 238,773,612 feet imported by Australia. Mr. Hamber says as to this:

"The logging operations in British Columbia are more costly, owing to the topographical nature of the country. It costs the British Columbia lumberman more for his machinery and sundry requirements, for the installation and upkeep of his plant. Owing to the surplus of labor in the United Staes the wages of the lumbering camps, mills, and factories are lower on the average than those prevailing in British Columbia. In most cases San Francisco shipping interests control the vessels carrying cargoes of lumber, consequently our mills are handicapped in this regard, as is only natural wherever preference can be given. American-owned vessels will load at American ports and assist American industries. It would also be found that cargo-carrying vessels, through different added expenses, make a slight discrimination to the detriment of British Columbian ports, making a difference of some 25c to 50c a thousand on the freight."

Canada enjoys a preferential arrangement with South Africa, which amounts to about 2½ per cent. on the value of the lumber, with the result that she does 64 per cent. of the total lumber trade with that portion of the Empire. Some arrangement with Australia similar to that with South Africa is sought. Australia would not be willing to give a reference unless a reciprocal arrangement can be entered into.

Great Britain's Import

Great Britain's imports during 1915 and 1914 included the following:—

	1914		1915	
	Quantity Cwts.	Value £	Quantity Cwts.	Value £
Wood, unenumerated, hewn (i.e., except fir, pine, spruce, pitwood, oak)—	Loads		Loads	
Total imports	63,229	267,627	33,285	226,078
Principal sources—				
Russia	30,332	77,890	1,942	7,289
Canada	14,451	109,395	18,448	125,294
United States	9,863	58,042	11,969	90,218
Staves—				
Total imports	93,439	556,066	109,377	707,888
Principal sources—				
Russia	38,698	237,848	20,815	121,177
Sweden	21,514	68,345	45,921	133,020
United States	15,181	124,039	32,723	298,356
Norway	12,822	43,242	13,495	50,361

Credit Men Honor Montreal Lumberman

Mr. W. Rutherford, of William Rutherford and Sons Company, Limited, represented the Canadian Manufacturers' Association at a dinner organized by the Canadian Credit Men's Trust Association, held in Montreal on October 3. The object was to discuss the subject of legislation as it affects commercial questions, particularly in the matter of credits. Mr. Rutherford suggested that Government aid should be asked, because the more losses that were eliminated from the various accounts of the companies the more there would be for the Government to collect on earnings. Ninety per cent. of the traders were honest, but business men had to protect themselves against the shyster.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Do You Have Trouble With Your Boilers?

Boiler trouble which so frequently occurs at sawmills, planing mills and woodworking plants, often causes expensive shutdowns and the consequent loss of time. Sometimes even it results in an explosion wrecking the whole plant. We would therefore call our readers' attention to the announcement of the Dearborn Chemical Company, of Canada, Limited, on page 2 of this issue.

The services of the Dearborn Laboratories are offered free of charge to all power plant operators who experience difficulties due to unsatisfactory boiler feed supplies, it being only necessary that a one gallon sample of the water used be submitted for analysis, together with a small sample of scale, representative of the accumulation present in the boilers, and a description of the plant equipment and conditions under which the boilers operate.

Plant of The Dearborn Chemical Company, of Canada, Ltd.

No charge will be made for the analysis, and a copy of the results obtained will be furnished, together with a statement as to the comparative quality of the water when considered for use as a steam boiler feed supply, recommendations as to the most suitable treatment, and a careful estimate of the cost incurred in the successful overcoming of any and all troubles experienced, attributable either directly to the water being used, or to the conditions under which it is being used.

P. B. Yates Plant Being Enlarged

Yates Quality (formerly Berlin Quality), the interesting monthly house organ published by the P. B. Yates Machine Company, of Beloit, Wis., and Hamilton, Ont., in its issue for July-August contains a number of specially interesting illustrated articles. One of these shows the extensive new plant which is being put up by the Company at Beloit. The cover of this issue is an illustration of the steel work in progress upon the new plant. No less than 21 important additions have been made to the plant of the company during the last thirty years, and now the present need for more room has led to the erection of still another addition, which will be the largest of all, occupying a full city block adjacent to the present plant. The new addition will be 266 x 296 feet and will contain 110,000 square feet of working floor space. In this way the company will secure an increase of 38 per cent. in their working floor space and their annual production will be greatly facilitated.

Installing Large Water Wheels

The S. Morgan Smith Company, York, Pa., have received contracts for the installation of water wheels for the Ouiatchouan Paper Falls Company, and Price Brothers, Ltd., the latter for their Rimouski pulp mill and their Jonquiere pulp mill. The turbines are required chiefly for driving grinders, and range from 350 h.p. to 1,800 h.p.

Sturtevant Fuel Economizers

The B. F. Sturtevant Co., Boston, Mass., have issued a bulletin (222) describing their economizers for use in power plants and paper mills. The bulletin is extensively illustrated and shows installations of their economizers in a number of important plants, including those of the Abitibi Power and Paper Company, Iroquois Falls, Ont.; the Brompton Pulp and Paper Company, East Angus, P.Q., and the St. Lawrence Pulp and Lumber Corporation, Chandler, P.Q. Sturtevant economizers have also been installed in a number of other Canadian plants, including those of the Spanish River Pulp and Paper Company, Espanola, Ont.; Ontario Power Company, Thorold, Ont.; Miramichi Pulp and Paper Company, Chatham, N.B.; J. R. Booth, Ottawa; Belgo-Canadian Pulp and Paper Company, Shawinigan Falls, P.Q.; Lincoln Paper Mills, Merritton, Ont., also the Anglo-Newfoundland Development Company, Grand Falls, Nfld., in addition to a large number of installations of important plants in the United States. Sturtevant fuel economizers have steadily come to the front on account of their obvious operating and mechanical advantages. One of their chief claims to distinction is found in the taper, metal-to-metal joints. There is not a gasket throughout the machine. This eliminates entirely the leakage with gasket joints. The Sturtevant Company have a staff of skilled engineers whose services are available in connection with any installation. As the conditions in paper mills vary greatly, this service is exceptionally valuable. The company will be glad to send their engineers to look over plants and make recommendations suited to special conditions.

Timber Preservation for the Farmer

How the farmer may preserve his buildings by the proper use of preservatives for timber is told in a bulletin just issued by the Department of Agriculture, prepared by George M. Hunt, chemist in forest products at the Madison, Wis., laboratory of the Forest Service. The bulletin is the summary of years of experimenting with timber in various ways on the farm, and through the laboratory, these experiments being made also in co-operation with agricultural experiment stations. The bulletin gives an exhaustive review of the causes of decay, due to the action of low forms of plant life, called fungi, which break down the fibre of the timbers. The bulletin goes in detail into methods of impregnating timber with various preservatives, and advocates coal tar creosote as the best preservative for general use. A special section of the bulletin is devoted to silos, which the author declares, can readily be made wonderfully lasting, while if the treatment of the staves for such wooden silos is properly done there is absolutely no impregnation of the ensilage. Treatment of shingles, telephone poles on rural lines, bridge timbers, sills and foundation timber are all described and advised as a measure of economy to the farmer. The author urges that groups of farmers provide co-operative treating plants for their locality where the pressure method of impregnating wood can be used, and thus give the best results. Where this is not possible it is shown that even application by brush is a valuable manner of protecting buildings against decay.

Miniature Sawmill as a Window Display

A miniature sawmill was displayed recently in the windows of T. McAvity & Sons, Ltd., St. John, N.B., to attract attention to the lines of staples carried by the firm and to show just how a sawmill looks in operation. The setting for the work was truly sylvan. The dense woods surrounding the miniature mill and the true-to-life mill pond all gave the necessary fixings to make the scene an ideal one. The miniature water-wheel turned with the regularity of its larger brother. By means of electric lights one could obtain a view of the interior of the mill. Its appointments were such as are to be found in the real industry. The log was already in position, and the saw had cut well into its heart. In the pond were other logs, ready to be drawn up as needed, and on the runway the hoisting chain had already drawn up its load, ready to be placed before the saw. It was a typical scene of industry, no essential being lacking to make the impression realistic. The entire large window was set in keeping with the spirit of the illustration.

British Columbia Timber Report for August

The timber returns for August, issued by the Forest Branch of the Department of Lands, Victoria, B.C., show the total scale of sawlogs for the province to be 107,843,857 feet B.M., in addition to 257,589 lineal feet of poles and piles and 26,635 cords of shingle bolts, posts, ties, etc. The returns according to forest districts are as follows: Vancouver, 73,313,384 ft. sawlogs, 62,430 lin. ft. poles, etc., and 15,248 cords of bolts, ties, etc.; Cranbrook, 12,855,604 ft. sawlogs, 20,330 lin. ft. poles, etc., and 7,715 cords of posts, bolts, etc.; Island, 12,411,953 ft. sawlogs and 209 cords bolts, ties, etc.; Prince Rupert, 4,378,017 ft. sawlogs, 47,083 lin. ft. poles and piles, and 60 cords of bolts, posts, etc.; Kamloops, 2,920,687 ft. sawlogs; Nelson, 1,685,969 ft. sawlogs, 114,582 lin. ft. poles, etc., and 3,215 cords of posts, bolts, etc.; Vernon, 177,157 ft. sawlogs; Hazelton, 83,184 ft. sawlogs; Lillooet, 9,558 ft. sawlogs and 11,282 lin. ft. poles and piling; Fort George, 8,344 ft. sawlogs, 1,882 lin. ft. poles and piles, and 100 cords of posts, etc.

New Vessels Will Develop B. C. Trade

Annual Capacity for Forty Million Feet Now Being Built —Only Canadian Cargoes on Outward Trips

In a recent communication to the Department of Trade and Commerce, Mr. H. R. McMillan, Special Trade Commissioner of the Dominion Government, says that he regards the condition underlying the future trade in Canadian lumber as very greatly improved. With special reference to British Columbia, he calls attention to the fact that in regard to the supply of bottoms, work is now actually going forward on nine ships, which, when completed, will carry about 40,000,000 feet per year, worth with outward freight earnings about $1,000,000. Three of these ships are being built in Victoria and six in North Vancouver, and all are being financed by Pacific Coast lumber companies. Already the cargoes have been sold in Australia for loading in early 1917. These ships are being built under the British Columbia Act, upon terms by which the outward-bound cargoes must be Canadian. Eight of these ships will be launched and outfitted with 320 horse power Diesel engines. The ninth will be prepared for engines but will be operated under sail until the engines, which now cost double the normal prices, can be purchased advantageously. There is a likelihood that other companies now investigating the question will build ships. The markets for which these boats are being built are Australasia, China, and Africa.

Improvement of Producing Facilities.

Mr. McMillan says that oversea buyers have already advanced as one argument in favor of buying in the United States the more extended lumber manufacturing facilities existing on the Pacific Coast of that country as compared with Canada, but upon having discussed this point recently with the leading operators of mills and several of the leading owners of stumpage, a conclusion that a betterment of Canadian conditions is now in sight was reached.

Some few years ago several lumber manufacturing companies were started in British Columbia under such an unreasonable load of overhead expenses that they could not compete in the open market, and, as a result, have now been closed down during the past two or three years. Even when operating the plants just mentioned they were equipped chiefly for the railroad trade, and the over-production on the railroad market was too great for them to be able to operate.

On account of the recent interest aroused in export trade a reorganization of these companies has been contemplated. Representatives are now writing down the assets to a reasonable figure for operation as soon as conditions warrant. There is a strong likelihood that several other mills built only for the rail trade will equip themselves with scows, docks, and other facilities for handling export shipments. This change in policy on the part of the rail mills will be a great improvement, as it will enable them to assist when a large volume of export business offers, thus increasing the facilities of the ports and rendering them partially independent of railroad market in times of local depression, and will relieve internal lumber over-production.

Mobilizing Possible Export Lines.

Export of timber from the Canadian West coast up to the present has consisted of a few staple lines, but it is intimated that a trade will be developed in shelving, door stock, pattern stock, shingles, pine clears, and spruce box lumber which will compete with Oregon and California, and in spruce and hemlock flooring and linings which will compete with Scandinavia. Although these articles are now produced in British Columbia, they have never been assembled for export, and when this can be done the overseas buyers will find it easier to assemble assorted cargoes. Mr. McMillan intimates that the present would be an opportune time for capitalists to establish on the Pacific Coast export houses, favorably known and with strong foreign connections. He says that at the present the whole Pacific Coast lumber export trade is in the hands of such houses in the United States. This question has been discussed with several of the larger lumber companies to whose interest it should be to enter this trade. All of these companies have developed certain connections, and it is hoped that new connections will be formed in foreign countries.

In regard to grading rules for the export trade, Mr. McMillan is of the opinion that it would be in the interests of the producers to have them revised. Of course, this is an international matter, but it is to be hoped that the trustees of the Grading Bureau and other authorities concerned may be able to do something in the way of revising the rules.

It is learned that a national advisory board is being formed in the United States, to include representatives of the Federal Government, timber holders, and manufacturers, in order to consider the serious public questions arising out of over-production of lumber on the Pacific Coast. The United States Federal Government is reported to be sending representatives of the timber industry to France and Germany to study the after-war demand for lumber.

Mr. McMillan states that the Chinese lumber market is the natural complement of the European, Australian, and African markets. The three last named markets take only 30 to 40 per cent. of highest grade timber in the log. The remaining timber—all low grade—is then left to dump on the domestic market, and the Chinese and South American markets take this low grade. The manufacturer shipping to Europe, Australia, and Africa is in a bad position if he cannot at the same time contract to ship his low grade to China and South America. Unfortunately the trade in China is almost all in the hands of two companies—the Chinese Import and Export Company (a German organization, backed financially and officered by Germans) and the Robert Dollar Company.

Several Canadian mills are interested in the Chinese business with a view to operating some of the new boats in the Chinese trade, bringing back cargoes of sulphur and rice. A few of the mills in British Columbia are hopeful that they may establish relations with a company in China that would enable them to make a contract to cut a fixed quantity of thirty to forty million feet per year. Smaller mills and larger ones also hope that a package trade may be built up on the several lines now running regularly to Japanese and Chinese ports. It is believed that commercial development in Japan, especially now during the activity of shipbuilding, will afford an opportunity for the development of this class of trade. The box manufacturers also are very hopeful of developing an export trade with China.

Quebec Cullers Report

The following comparative statement of timber, measured and culled to date, is furnished by the Quebec Supervisor of Cullers' Office, under date of October 6th:—

	1914. Cubic Feet	1915 Cubic Feet	1916 Cubic Feet
Waney White Pine	591,440	399,280	142,160
Red Pine	1,040	.....	.....
Oak	337,360	110,120	321,160
Elm	305,240	46,840	69,440
Ash	680	840	1,680
Butternut	.....	.....	40
Birch and Maple	50,800	48,880	46,880

Shipbuilding in Nova Scotia

Continued activity is reported from the shipyards along the bay shores of Cumberland and Colchester Counties, in Nova Scotia. The keel was recently laid at Port Greville of a three-masted schooner of 400 tons. Another vessel of similar class at the same place is rapidly nearing completion. At Spencers Island a schooner of 425 tons is now in frame. This is the first ocean-going craft to be built there in fifteen years. The Glooscap, one of the largest sailing ships ever built in Canada, was the product of that town's skill. A schooner of 430 tons is nearly ready for launching at West Advocate. Its three masts are 90-foot Douglas fir sticks. All of these vessels are being built primarily for the lumber trade, and have been specially designed to meet the requirements of that service.

Hoffman Brothers' Fire Did Not Interfere With Business

Hoffman Brothers Company, Fort Wayne, Ind., report that a fire which occurred in one of their isolated buildings on the night of October 6th destroyed only one of their six veneer saws and a small amount of veneers, but did not in any way affect the orders which they have or materially decrease their production. Three new mills were in process of construction before the fire, as it has been necessary for them to increase their capacity to meet the demand for their product. Their new "Plant C" will be in full operation about the 20th of October. The firm manufacture veneers and hardwood lumber, and do a large business in sawed veneers (single ply), in the domestic hardwoods, such as quartered and plain red and white oak, ash, cherry, hard maple, domestic black walnut, etc.; also band-sawn hardwood lumber.

Veneers for Piano Cases, etc., in Demand in Australia

There is an active demand for veneers for making piano cases and for high-class cabinet-making. Walnut veneer is especially favored in the Australian piano industry. Canadian manufacturers sending a range of small samples, together with quotations upon the basis of free-on-board steamer Montreal or St. John, are assured of their veneers being promptly brought under the notice of the principal Australian importers.

Good Fire Record in Dominion Railway Belt

Two hundred and ninety-nine fires occurred in the Dominion railway belt under the jurisdiction of the Dominion forest rangers in the season of 1915, and the loss of merchantable timber was somewhat extensive. In the season just closed 90 fires occurred up to September 28, and of the total amount not one could be classed as a real hazard, and damage to timber was practically nil. Of the 90 fires in 1916 no ess than 26 occurred in September.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Maple Wanted

Wanted 4-in. Maple plank and Maple Axles. Jackson Wagon Company, St. George, Ont. 20-20

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Wanted to Buy

Maple Squares 18 inches to 48 inches long; 1 in., 1¼ in., 1½ in., 1¾ in., 2 in. and 2¼ in. squares.—Apply to A. K. Hansen & Company, Quebec. Que. 20-t.f.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Lumber Wanted

We are in the market for a quantity of Birch, Soft Elm, Hard Maple and Basswood, dry stock, for immediate shipment. Will be pleased to receive full particulars as to quantity, grade, and lowest prices. Apply, The London Lumber Co., Ltd., London, Ont. 18-21

For Sale–Lumber

Lumber Wanted

A list of what stock you wish to move placed in this column for a few issues will dispose of the lumber. Let us quote you on an ad. 20-23

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal. Que

For Sale

1 car 1 x 4 in. and wider, 37 in. long.
1 car 1 x 4 in. and wider, 31 in. long.
1 car 1 x 4 in. and wider, 22 and 25 in. long.

Dry Quartered White Oak, Clear 1 face 2 ends and 2 edges, 2 years old, nicely figured, Ohio stock. Write us for delivered prices.

PROBST LUMBER COMPANY,
18-21 Cincinnati, Ohio.

For Sale

We have the following stock for immediate delivery:—

50,000 ft. 3 x 6 Hardwood Hearts, mostly Maple.
25,000 ft. 4 x 4 Hardwood Hearts, mostly Maple.
200,000 ft. 1 in. Hardwood crating, principally Maple and Birch.
100,000 ft. 1 in. Birch, No. 2 Common and Better.

The Pedwell Hardwood Lumber Company,
18-t.f. Toronto, Ont.

For Sale–Machinery

Machinery Wanted

If you have any machinery for sale right here in this column is the place to advertise it. Every man who reads here is looking for a machine—if you have that machine you can do business. Let us quote you on an ad. 20-23

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

FOR SALE

We have the following second hand machines to offer, ask us about others not listed, if you are interested.

1 Egan 30 in. 2 drum sander.
1 McGregor Gourlay 30 in. 2 drum boss sander
1 Jackson Cochrane 36 in. 3 drum sander
1 Egan 42 in. 3 drum sander
1 Cowan 42 in. 3 drum sander
1 Cowan 48 in. 3 drum sander
1 C. M. C. 8 in. 4 side sticker
2 Ballantyne 12 in. 4 side stickers
1 Egan 36 in. single surfacer
1 Harper 26 in. single surfacer
1 Cowan No. 220 24 x 10 single surfacer
1 McGregor Gourlay QY 15 in. planer and matcher
1 McGregor Gourlay QY 9 in. planer and matcher
1 Jackson Cochrane 54 in. band resaw, 5 in. blade
1 Jackson Cochrane No. 165 rip saw

P. B. Yates Machine Co., Limited
Hamilton, Ont.

Portable Saw Mill

Wanted portable saw mill about 25 horse power, that will cut 5 to 10 M. feet hardwood per day. Apply Box 464, Canada Lumberman, Toronto, Ont. 20-20

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

---

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

OPEN FOR ENGAGEMENT from October the first. Qualification, a practical knowledge of grades in hard and soft wood lumber. Have acted in the capacity of Superintendent and Manager for large lumber operation with satisfaction. Satisfactory references on application. Box 287. Phone 146, Huntsville, Ont. 19-20

OFFICE CLERK (Lady) WITH EXCELLENT BUSINESS EXPERIENCE, wants position. Any lines. Preferably Timekeeping, Pay Rolls, Cashier, or General Assistant to Manager, lumber company's plant, Quebec province, or northern New Brunswick. "Lumber," Box 462, Canada Lumberman, Toronto, Ont. 20-20

WANTED POSITION AS ORDER CLERK and Eestimator in Mill-work Factory. Can work from plans. Have had six years' experience in shop and offices. Age 23 years. Single. At present employed in factory which does a large business in Sash, Doors, Blinds, Trim and Cabinet Work. Box 468, Canada Lumberman, Toronto, Ont. 20-20

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

FIRST CLASS MILLWRIGHT WANTED at once to install machinery in saw mill. The Turner Lumber & Pulpwood Company, Lake Edward, Que. 20-20

Business Chances

For Sale

Twenty acres Elm and Basswood, also 40 acres of Virgin Cedar near station. S. A. Price, 71 Lakeview Avenue, Toronto, Ont. 20-23

Contracts To Let

Contracts to let for taking out and making railway ties at two points in eastern Ontario. Box 466, Canada Lumberman, Toronto, Ont. 2020

Sawing Contract

Wanted party with portable saw mill to cut hardwood by the thousand. Four or five years' work for good responsible person. Apply Box 463, Canada Lumberman, Toronto, Ont. 20-20

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 18-21

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, crosscut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.

Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

Miscellaneous

Blankets For Sale

Two Hundred Pairs Clean Blankets in good condition. The Peterborough Lumber Company, Limited, Peterborough, Ont. 20-22

Timber Limit For Sale

Thirty-six square mile limit, North Shore, License allows cutting all kinds of timber. Contains Hemlock, Birch, Spruce, Pine, Cedar Ties and Poles, Pulpwood and Hardwood. Railroad runs through part of berth. Cheap operation. Splendid opportunity for small mill. Apply Box 423, Canada Lumberman, Toronto, Ont. 13-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of December next for the right to cut pulpwood and pine timber on a certain area situated on the Pic River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet, board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for twenty-five thousand dollars ($25,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $25,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, August 28th, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 18-22

Cost of Machinery

In connection with sawmill costs, there is a difficult problem for every manufacturer to work

out, and that is the cost of machinery. What is meant by this is not the original cost of any given machine, but the proportional cost of the item of machinery for doing any given work. This must necessarily include the cost of machinery as compared to the work it does, the life of a machine, or the amount of depreciation in value each year, and the chance, meantime, of some other more up-to-date machine being invented, necessitating the replacing of the machine before it has really served its time.

It is considered by a contributor to the American "Hardwood Record" that machinery depreciates about 10 per cent. each year. This is, in substance, that the life of a machine should be reckoned at about ten years. This may be a fair average, but it is not conclusive. There are machines in use to-day that are 75 years old. Other machines are sometimes ruined through accident or something of the kind inside of five years. Some machines wear out very rapidly. Others last as long as a man. Estimates are complicated by the claims made for some new machinery that it will pay for itself in a very limited time.

The matter of machinery paying for itself raises a complicated question. It goes without saying that every machine must pay for itself in a certain length of time. Otherwise, it is a loss. But to make it pay for itself, a certain amount each year must be allowed to the machine for its share of the work, just as so much is allowed for the machinist. This is one way of looking at it. There is another way. There are those who say that improved machinery will do more work than others previously in use at the same labor cost. This is frequently true, but it, like lots of other truisms, depends to a certain extent on other things.

In the first place, if it effects a saving over the old machine, you will have an advantage in first cost until your competitor puts in the new machine also. Then the situation changes. You haven't any more advantage over the other man in the business than you formerly had, and the benefits that accrue from the saving go to the world in general by cheapening the article produced. This is one of the inevitable results of competition, and is a point which must be considered in deciding whether or not a machine will pay for itself on the basis of its work compared to the work of the older machines.

Another factor is the possibility of some other machine being invented soon after this new one is installed. This other machine may offer such advantages over the new one that it will become necessary to make a change before the machine has had time to pay for itself. In this case, if you don't buy the new machine, you are left behind by your competitor, who will get it and then have the advantage over you. It is easy to see, therefore, that this matter of the cost of machinery, and of machines paying for themselves, is a subject in which one may get tangled.

The Man Who Named the Douglas Fir

Douglas was the family name of Lord Selkirk, founder of the Red River Settlement, and it was the name of other men who have been prominent in Western Canada, so that considerable doubt exists in the popular mind as to the particular man after whom the famous Douglas fir was named. It is found that it was not named after a founder, governor or chief justice, but after a remarkable man in a humbler sphere of life. It should also be noted, too, that while the name of Douglas will always be associated with the common name of this magnificent tree, yet the scientific name fails to show any connection. It is called scientifically Pseudotsuga, literally false hemlock. It is not false hemlock. It is a much finer tree than any hemlock, and it is to be hoped that a later generation of botanists will change the name and give Douglas a place in it.

Regarding Douglas, Dr. Charles S. Sargent, Director of Arnold Arboretum at Harvard University, has this to say, in a footnote in his famous work "Silva of North America":

"David Douglas (1798-1834) a Scotch gardener, sent by he Horticultural Society of London, to explore the forests of the Northwest Territory, is from his courage, energy, and success in the presence of great difficulties and dangers, and from his untimely and horrible death, a conspicuous figure in the annals of American botanical exploration. Douglas, who had been trained by Sir William Hooker, and had made a short botanical journey in Eastern America in 1823, was sent in 1824 by way of Cape Horn to the Columbia River, where he arrived in April, 1825. He spent two years in Oregon, discovering some important trees, including Abies Nobilis (noble fir), Abies amabilis (Lowland fir), and Pinus Lambertiana (sugar pine), the largest of its race.

Entente Allies are again buying Pacific Coast spruce aeroplane stock, after being out of the market for several months. Shipments of spruce for aeroplane purposes amounted to 2,353,355 feet, valued at $125,243, during the month of September, the shipments being the heaviest of any one month since the war started.

Review of Current Trade Conditions

Ontario

Although there is nothing specially interesting to report in connection with the lumber trade situation in Ontario, as compared with that of a fortnight ago, the general condition of the trade is fairly satisfactory, and there is quite a fair volume of consumption in progress in all parts of the province. Of course building operations have little or nothing to do with the volume of trade, and the building factor has now probably been eliminated pretty well until next spring. The general industrial situation and the extensive recruiting of men from all parts of the province are still causing manufacturers to limit the extent of their operations. The outlook at present is that the production at nearly all Northern Ontario points will be very heavily reduced during the coming winter. A wholesaler who is in very close touch with this situation says it is a known fact that the production of lumber on the north shore of Lake Huron will be cut down by at least 75,000,000 feet next summer. He also expresses a belief that the output on the Georgian Bay and north shore will be 40 per cent. short of normal. The chief reason for the curtailment is the greatly increased cost of taking out logs in the woods during the coming winter.

The shortage of stocks is already making itself felt on the Ontario market, and there is a fair demand and prices have been stiffening. During the last month there has been an advance of from $1.50 to $2 a thousand on most of the soft woods that are produced in Ontario. A wholesaler, discussing matters with us, advises us that September was a splendid month with his firm. We have reports of a similar nature from several other firms. This particular wholesaler has found a better demand in practically all quarters, not only in Ontario, but for export to the United States and to Europe. There is a shortage of common lumber in 4, 5, 6, and 8-in.—in fact, these lines have almost disappeared, and stocks in nearly all other lines are low. There is a good demand for culls, and prices are strong.

Eastern Canada

The market at St. John, N.B., continues to improve. The actual demand has not increased to any great extent, but buyers of deals for foreign account are taking more interest in the market. Evidently the allied powers are expected to use great quantities during the present fall. There is considerable activity in the making of contracts with rotary or portable mills in the interior, and a large number of these plants are expected to operate this winter. As high as $18.50 to $19 is being offered for these winter-sawn deals. St. John operators are seriously handicapped by the great shortage of labor and the high cost of provisions, feed, etc. No contracts for the full 1917 cut of deals have yet been reported, but some are expected before long. Stocks of deals held at St. John are light. Freight rates are unchanged. Much improvement is reported in the American market, particularly in New England, and prices have advanced $3 per thousand during the last two months. Further advances are expected. The demand is keen, and enquiries are coming in steadily. The New York market also is improving. The car shortage is a serious handicap to the mills in connection with this trade. The rafting season on the St. John has come to an end, and it is expected that the final statement will show a total of between fifty and fifty-five million feet.

Boston wholesalers report that they expect the supply of lumber to be short during the coming year. Stocks on hand are now shorter than usual. The mills are not able to run full time as a rule, and it costs them about as much to do three-quarters of a day's sawing as it did previously to do a whole day's. Pine prices are rather unsettled. About six months ago they showed signs of stiffening up, but when the English demand fell off the prices went back to where they had been previously, and the situation seems to have continued on this basis up to the present. A strengthening tendency is shown in the price of barn boards. One by ten-inch are selling at $40, and 1 x 8-in. at $38. For 1 x 10-in., No. 2, the price is about $37, and for 1 x 8-in., No. 2, about $35. For 1 x 10-in., No. 3, $31.50 is the selling price, and for 1 x 8-in., No. 3, $30 to $31. Ten-inch are worth fully as much as twelve-inch at present, as stocks of this size are short. Canadian spruce boards at Boston have stiffened, and are now bringing $25 to $27. Spruce dimension 10-in. is worth $30; 12-in., $31; 9-in., $29, nad 8-in. and under, $28. Spruce, random lengths, 10 and 12-in., are bringing $29. The smaller sizes are also somewhat higher, being worth in random lengths as follows: 2 x 3-in. and 2 x 5-in., $22; 2 x 4-in., 2 x 6-in., 2 x 7-in., and 4 x 4-in., $23; larger sizes up to 8-in., $24 to $25. Some people are asking a little more than that for random spruce. Lath are selling at $4.25 for 1 5/8-in. and $3.80 to $4 for 1½-in.

The demand for shingles at Boston is steady and quite satisfactory for this time of year. White cedar extras are selling at $3.45 to $3.60 and clears at $3.20 to $3.30. There is a satisfactory demand for red cedars. The best grade of Vancouver shingles, 16-in., 5 butts to 2 in., are selling at $4. The best perfections, 5 butts to 2 1/8 in., are bringing $4.95. Eurekas are selling at $3.75. Washington shingles, 5 butts to 2 in. 16in., best grade, are worth about $3.75. Washington perfections are bringing $4.85 and Eurekas $4.30. These are prices delivered on Boston rate of freight.

Great Britain

The lumber trade a London has recently been enjoying a considerable increase in the volume of business, largely on account of extensive orders placed by the British Government. Most of the contracts call for early delivery and the result is a general improvement in the demand for certain "spot" sizes, followed by a sudden advance in prices. Importers, agents, brokers and merchants are all feeling optimistic. The market, however, does not present anything in the way of a stable appearance and quiet times and busy times are just as likely to succeed one another in the near future as they have for some time past. There has been a good demand for deals, especially for 4 inch, due to the shortage of White Sea goods. Eleven inch deals are selling at abnormally high prices. Spruce and whitewood are also in strong demand.

At Liverpool, trade has been rather quiet. Spruce arrivals have been in fair quantity and have come forward on easier rates of freight, so that good opportunities have been offering for holders to reduce their prices to a moderate average. The demand, however, has not been strong, and importers are not showing much of an inclination to increase their stocks. The easier freight rates did not hold for any length of time and they are now on the up grade again, showing every indication of reaching their former record heights. The probability is that liner parcels will be very scarce as so much more attractive freight is offering. The demand for floorings is poor and stocks are heavy, so that holders are satisfied to get out without any actual loss. A recent arrival of Miramichi pine to R. Cox and Company is reported. We learn that this stock reached Liverpool when the market was practically bare of these goods, so that a fair enquiry was expected. Spruce values have been improving. Prices quoted by merchants for goods on the quay vary slightly, the average running about £25 10s for 3 x 7 and 8 in., £27 10s for 3 x 9 and 10 in. and £30 for 3 x 11 in.

The trade at Manchester is quiet. Buyers apparently have decided not to take on stock until there is a more confident feeling all round, particularly as regards military requirements in the matter of men. There is, however, a steady consumption all the time in timbers used for munitions of war. Ocean freights have shown a tendency to increase, but for spruce to the west coast of Great Britain they were still at 250s, October shipment, at latest reports. Timber imports to all sections of the Manchester canal for the eight months ending August 31st, 1916, amounted to 205,525 loads, as compared with 259,328 loads for the corresponding period of 1915.

Business continues quiet at Glasgow. No alteration is reported in connection with spruce, although the sales recorded are at rather firmer prices than before and the general opinion is that prices have touched bottom and may be expected to stiffen up to some extent. The demand is very light, most of the sales reported being of a retail character.

United States

The car shortage situation continues to be the most important feature in connection with the lumber trade situation in the United States. No relief is reported as yet, and lumber shippers in all parts of the country are experiencing much difficulty. The scarcity of cars is most pronounced in the South, and comes at a time when manufacturers, after a long period of low values, are commencing to report a heavy demand at more satisfactory prices. On account of the car scarcity, however, they are not able to take full advantage of the improvement in the demand. Every railroad in the country is short of rolling stock, and never in their history have they experienced so great a demand for their services. Apparently there is no immediate improvement in sight. Retailers are finding it difficult to obtain stocks, and many of them are trying to anticipate their wants for the balance of the year so as to avoid further trouble if possible. Stiffer prices are likely to be the result.

The railroads are experiencing the greatest volume of business in their history, and practically all of them are showing handsome profits, thus making railroad improvements possible and additions to rolling stock. The car foundries all over the country are filled with orders for equipment. The lumber industry is commencing to benefit from this

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

situation. The demand for wood for car purposes is creating new business for manufacturers in all sections.

The Southern Pine Association's trade barometer for the last week in September indicated that shipments were less than production for the week by 10.69 per cent., while orders exceeded production by 9.66 per cent. The actual production of 153 mills for the week was 13.21 per cent. less than normal. Evidently the Southern pine manufacturers are continuing to curtail so as to prevent the accumulation of excessive amounts of stock in their yards. The trade barometer for the West Coast Lumbermen's Association for the week ending October 3rd showed that the production was 11.16 per cent. below normal. Orders were 2.87 per cent. below actual production and 14.98 per cent. below normal production. Shipments were .58 per cent. below actual production and 12.98 per cent. below normal production. Shipments exceeded orders by 2.30 per cent.

The trade in Northern pine at Buffalo shows an increase in some grades, and the best demand is for the intermediate and lower stocks. Arrivals by lake have not been so plentiful as was expected, and some yards are finding it necessary to place orders outside for much of their present requirements. Prices show a tendency to advance, and are expected to go up one dollar or more within the near future. The demand is good also at North Tonawanda, but wholesalers are having difficulty in filling orders on account of the scarcity of stocks. Some of the lower grades are very scarce, and, as vessel shipments have been light, some dealers are purchasing stocks for rail delivery. Prices have been advancing of late, and higher quotations all round are expected before the season is over. A better business is reported in Northern pine at Chicago. The demand has increased considerably, especially for Nos. 1, 2, and 3 in yard stock items. Prices are firm. There is an average demand for hemlock at Buffalo, and prices have been improving slightly, in sympathy with yellow pine. At North Tonawanda it is expected that the scarcity of hemlock on account of the reduced arrivals by vessels will result in higher quotations as the season advances. There has been a slight movement in hardwoods at Buffalo. The demand is chiefly for maple, ash, and oak. There is also a fair demand for birch.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Improved Trade at St. John, N. B.

St. John, N.B., Oct. 10th.—(Special to the Canada Lumberman.)—During the last two weeks the market has shown further signs of improvement. Although the demand is not improving, there seems to be a more optimistic feeling among the buyers of deals for foreign account, whether for private parties or some of the allied powers at war. Most likely the latter are the chief buyers, as most of the powers have stopped all selling to private individuals or firms within their boundaries, absorbing practically all stocks themselves. Evidently they are using large quantities again this fall, no doubt preparing for the winter campaign.

Prices for spot deals are firm. Contracts are being made quite extensively with rotary or portable mills through the interior of the province. It is said that there will be a very large number of portable mills operating during the coming winter. Many farmers who have small lots of logs are hauling them to the mills, having them sawn, and selling the deals, instead of floating the logs to St. John and then selling them to the mills. Stumpage is increasing very materially in price, and parties having wood lots of their own are asking almost prohibitive prices for the standing timber. Many of the stationary mills prefer not to buy at these prices, as they know it means loss, but many of the portable mill owners come along and pay these prices. Nine times out of ten they come out in the spring in debt, many times losing all they possess. As they are forced to give security to the deal buyers for advances, they put up their whole winter's labor and many times the fruit of their farms. So long as the purchaser of the deals is not called upon to pay more than the contract price, he does not care; rather it is the custom to spur on the portable mill men in this undesirable way of cutting. During the last ten years the failures in the business have been enormous. It is said that as high as $18.50 to $19 is being offered for winter-sawn deals, with scantlings, fourths, etc., at $16 to $17. Many are said to be going in to cut with these mills.

Entire plans for logging for the St. John mills during the coming winter have not as yet been arranged. The tremendous scarcity of help is a great drawback in getting started for the woods. Many of the men who are at home are digging the fall crop of potatoes, and Maine, which always calls away a good many province men, is this year offering higher wages than ever. It is hoped that as soon as the harvesting is over men will not be so scarce. Of course, it is a foregone conclusion that logs will cost more this year than before. With $10 to $15 per month extra wages, much higher price for provisions and horse feed, and inferior help, only a good winter will keep down the cost of logs within reason. Unless the operator can sell his deals during the coming year for a great deal more than in the past, he will have to face a loss. As yet no contracts for full 1917 cuts of deals from mills here have been made, but no doubt before long some sales will have been made with the St. John mills.

Stocks of deals held here are not heavy. Many of the mills have been idle all summer. Others have only had a short season; in fact, to-day only Randolph & Baker, Stetson, Cutler & Co., and Murray & Gregory are sawing at St. John, and will be the only mills to do so up to freezing, all the others being sawn out of logs.

Freight rates remain about the same as of late. Little or no change can be said to have taken place. Coastwise few vessels are offering, even though the freights are $6 per M feet to New York.

The American market has shown a vast improvement, especially in New England. Prices have advanced $3 per M during the last two months, and this does not seem to be the end. The demand is keen, with no signs of abatement. Enquiries are steadily coming to hand. New York, which has been quite dead during the summer, shows a sign of improving. Car shortage is causing the mills all kinds of trouble, with no chance of relief so far as the near future is concerned.

Large quantities of pulpwood moving from Northern points to the United States are taking a vast number of cars.

The rafting for the season has just been finished at the Fredericton booms, but the final statement has not been made to date. Somewhere from fifty to fifty-five million feet have been rafted during the past season.

Better Prices for Lumber at Ottawa

Ottawa, Ont., Oct. 10th.—(Special to the Canada Lumberman.)—In the last month a heavy movement in lumber has taken place in Ottawa, particularly in the middle or lower grades of white pine. Prices have advanced from $1.50 to $3 per thousand on the grades mentioned, and before spring it is confidently expected that there will be another sharp advance.

The cut of lumber throughout the Ottawa Valley and Georgian Bay districts will fall quite materially below normal.

One of the features of the situation is the lack of facilities for shipping, owing to so many embargoes existing, particularly where war munitions are being handled. There is a considerable shortage of labor, but this has been partly relieved of late on account of nearly all the mills in the Ottawa Valley being closed down for the season.

The wages of bushmen are higher than ever before, and difficulty is met in getting a sufficient number of men for the woods.

Quite a number of lumbermen are going into the woods much more extensively than last season, partly on account of the large number of fires that have occurred on different limits and by their desire to get the trees that were killed by fire cut this season and thus prevent worms from getting into the timber.

Throughout the summer the mills in Ottawa have only been fairly busy. Retail business has been rather poor, and not much building has been done. All the retailers now report conditions much improved and trade generally better.

Improved Trade Conditions at Montreal

Montreal, Oct. 10th.—(Special to the Canada Lumberman.)—There is a fair demand for lumber, trade having slightly improved since the C.P.R. raised the embargo on goods going to their Montreal terminals. Sales of box lumber have decreased. The Imperial Munitions Board has declined, for the time being, to take further deliveries from some firms making the smaller boxes, on the ground that there is an overproduction, although the firms are, as a matter of fact, behind with deliveries.

Some descriptions of lumber, particularly in spruce, are hard to obtain, and orders have been declined on this account. Wholesalers find great difficulty in getting delivery from the manufacturers, who have been handicapped by the scarcity of help.

The local yards are doing a quiet trade. Building continues to be slow, and, even were more contracts in hand, it is questionable whether the demand for lumber would be much brisker. Contractors are finding it very hard to obtain labor, and firms who are anxious to secure men, especially for out-of-town jobs, can only get a small percentage of their requirements.

Building permits for September show a decrease—the first, how-

Morehead Back to Boiler System

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company,** of Easton, Md., after giving the "Morehead" system a thorough trial.
Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—
—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.
Save **fuel** by bringing the pure condensation directly back to the boilers HOT!
Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.
Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

Canadian Morehead Mfg. Company
WOODSTOCK, ONTARIO

Make Wood Pulp

We can dispose of all the Canadian wood pulp you can make. The cost of installing a small Soda Pulp Plant is very slight considering the extra profit for you.
Take advantage of the increased demand in Great Britain for Canadian Wood Pulp on account of the war. We can arrange for long term contracts if you desire. We have imported ninety per cent. of the Canadian Wood Pulp supplied to Europe since 1899.

WRITE FOR PARTICULARS

Limited
34-40 Ludgate Hill
LONDON, E. C., ENG.

ever, for three months. The total of $205,456 is $145,440 below that of the corresponding month for 1915, while the aggregate for the year is $3,787,010, a loss of $725,248.

A moderate amount of lumber is going to the United Kingdom, a tramp having been loaded for an English port. In normal times at this period shippers have all they can do rushing goods forward, but there is no indication that the end of the season will see anything approaching this condition. British markets do not encourage any large shipments. Freight rates, too, are against any heavy deliveries.

Sulphite and ground wood pulp are very scarce, and it is difficult to get supplies for immediate requirements, most of the mills being sold ahead. Ground wood has been selling at $31 per ton. Some mills are considerably increasing their grinder equipment, although the production will not come on the market until next year. The sulphite position is very strong. The Riordon Pulp and Paper Company will commence making bleached sulphite at their Merritton mill at the end of this month.

North Shore News—Heavy Reduction in Cut

Thessalon, Ont., October 7th; (Special to the Canada Lumberman):—There will be a reduction of about sixty per cent. in the log output of the north shore this season. Some of the larger firms are not doing any logging at all and those that are operating are only taking out about fifty per cent. of their usual amount.

The Thessalon Lumber Company, which has been operating at Nesterville, Ont., for the last ten years, has been succeeded by the Bishop Lumber Company, Limited, with H. H. Bishop, the well-known Chicago lumberman as president, and A. E. Bishop, secretary and treasurer. Archie McGee, a veteran lumberman, is woods superintendent. The new firm are commencing business under the most favorable circumstances, with one of the finest mills in the province, and plant in the woods that is second to none. They have purchased a large limit of 36 square miles on the Mississaga River from the Georgian Bay Lumber Company, and are operating there at present.

Wages in the woods are very high, being $35 to $45 per month and board, and sometimes $20 for railroad fares. The majority of the men are coming from the province of Quebec.

The mills have been very busy this fall shipping lumber. Vessels have been scarce and rates high.—Algoma.

Halifax Market Report

The Halifax, N.S., Chronicle, in a recent issue says:—"Since our last report on this market English prices reacted somewhat for the better and then eased off again. A number of small cargoes offered at the higher prices and prices then declined. On the west coast of Britain the price now quoted is £22, but the south coast and London prices have improved a little, prices now quoted being £24. Since our last report freights went down as low as 200 shillings and then reacted to 250 shillings. In fact the last fixture for a Nova Scotia charter was as high as 275 to 300 shillings. Though our shippers were actually looking forward to a rise in freights in the hope that the market would respond, it has not done so, and the general situation in deals is by no means as bright as Nova Scotia lumbermen would wish for. There are at present too many cargoes offering on the English market and a lot of cargoes have been stored, on account of the prevailing low prices. Also the consumption has decreased, because of the enlistment in the army of so many workers. Deal shipments to the United States from Halifax have been fairly active and, though there are some pessimists on the subject, local shippers expect to see normally large shipments from this port. The American market lately has improved somewhat both in lumber and laths, hemlock scantling now bring $21.

Great Forest Fires in History

The Northern Ontario forest fire of July 29th last takes rank as the third mose serious fire catastrophe in the history of this continent. The Hinckley fire in Minnesota in 1894 was responsible for 418 lives and the burning over of 160,000 acres. The famous Peshtigo fire in Wisconsin in 1871 killed 1,500 and devastated 1,200,000 acres of timber. In 1825 occurred the Miramichi fire in New Brunswick and Maine, with a loss of 160 lives, six towns, 1,000 head of cattle, and damage to 3,000,000 acres of forest. The Clay Belt fire in Ontario, with 262 lives lost and 800,000 acres fire-swept, takes its place with the great disasters of history. The Porcupine fire in 1911 killed 84 persons.

It is noteworthy that Wisconsin, Minnesota, Maine, and New Brunswick have taken comprehensive measures to prevent further disasters by organizing their forest patrol systems on modern lines—building trails, lookout towers, telephones, etc., as well as carefully supervising settlers' clearing fires, one of the worst sources of danger. Ontario, which has given the continent its two more recent fire catastrophes, has made no such move to modernize her forest guarding system.

A Good Time to Create Business by Power of Suggestion

It is an old-time habit with lumber dealers to depend wholly on the trade that voluntarily comes to them. They have always indulged in the notion that when a man has made up his mind to do some building or repairs he would, of his own volition, come to the lumber yard and get the materials he needed for the job. This was, and perhaps is now, the attitude of the large majority of the lumber dealers of the country in both city and country places. The exceptions are those whose enterprise and ability prompt them to discard the waiting idea and push out and stimulate people to make improvements who didn't realize they needed them. I heard a preacher say, in his sermon last Sunday, that people generally do not use but a very small portion of their personality and mental ability. These enterprising dealers I speak of use a larger per cent. of their ability than the average dealer does, and hence their greater success in their business.

Some great writer has said that every human being has in his brain everything that another has. It is only a matter of stimulation and cultivation to develop it. Every mental faculty is inherent in every normal being, but more pronounced in some than in others, and hence we see the different degrees of business acumen and ability more developed in some business men than in others, and these naturally are farther along to the eminence of achievements. Now, if this is true, and I believe it is, that all men have the same inherent faculties, don't you think it would be a good idea to take an inventory of your mental faculties, particularly those that apply more directly to your business? Ask yourself if you are getting out of yourself all you are capable of. Don't you believe there is a possibility of your being able to develop your business to a greater extent than you have or are now doing? Is your ownly ambition to "lay down" on what is in you and wait for things to come your way? If it is, you'll never make a success in business or anything else. But if you have the ambition and purpose to make a success in your business take stock of yourself and see wherein you are deficient and then go to work and cultivate those very things that you feel the need of.

The majority of you who are reading this are in small towns where the spirit of improvement is listless and dull, which is generally attributable to a lack of means to do much of anything, but the real reason is from a lack of stimulation. Most everybody likes to see improvements going on, but generally at somebody else's expense, and yet, in many cases, these same folks are as well able to do something of the kind as those are who are doing it. It is the same way out among the farmers, who, curious to say, are usually ready and willing to spend money freely for any improvements in farm implements and yet are so prone to be niggardly in the matter of building improvements, especially anything for their dwellings and relative conveniences. Now, this is one of the greatest of the problems for the present-day dealer—how and by what methods to stimulate and cultivate his territory for the development of more business. It is not enough to go after a man and ask him to build and make improvements on his place when he don't see or appreciate the need of them. You are wasting your time on such a man, and at the same time discouraging yourself, which is the worst part of it, for it dulls the edge of your energy, and that is a serious thing for a business man.

On the contrary, the thing for you to do is to study out how you can make that farmer see for himself his need for those things you want to sell him the materials for, because, believe me, the first thing in a sale is to make the customer feel that he ought to have it and the next is to make him want it.

How to Increase Your Sales.

Now, all of the foregoing has been leading to what I wanted to say to you particularly at this time, and something, too, which, if you will act on it, will materially increase your sales. I presume that on my trip this summer I saw at least a thousand miles of farms. Of course, I had no opportunity to inspect any of them, but the vast amount of farm implements and machinery that I saw standing out without cover to protect them from the depreciating effects of the weather led me to conclude that this indifference and neglect of the farmers extended generally over the country through which I was passing. At the same time I couldn't help wondering what the lumber dealers were doing to counteract this indifference of feeling on the part of the farmers toward their own financial interests.

Now, we all know that, as a rule, the farmers are a thrifty class of people, especially in the smaller things. But in many of the larger it would seem they are blindly wasteful, and more on account of habit than anything else, which is a charitable way of putting it, for we cannot lay it to a lack of general intelligence. They are usually good buyers and sellers, as you have all experienced. But in caring for what they raise and their improvements they are, in the main, indifferent and neglectful. Experts in agriculture even go so far as to say that American methods of farming are the most wasteful of any civilized country in the world. Be that as it may, we all know that the average farmer is neglectful about caring for his farm buildings and the sheltering of his implements and machinery.

In going through the rich farming lands it looked to me as though the great majority of farmers were working for the landlords, and per-

McLennan Foundry & Machine Works

CAMPBELLTON, N.B. Limited

haps this is the main reason to account for the rusty, dilapidated appearance of the farm buildings and the small number of them on the places. Where many of you are doing business, however, the greater number of farmers are working a close-fisted landlord who has retired to live in the town and is spending his remaining vitality in kicking against improvements in the town. And therefore you lumber dealers who are running yards where the retired landlords are not so numerous have a better opportunity to cultivate your abilities for creating a demand and supplying it. And there is hardly one of you but who has a wide field for exercising himself in this respect by inducing farmers to purchase material for sheltering their farming tools and other machinery which they may have. I know you have the old habit of neglect to contend against, and this calls for a greater degree of intelligent effort on your part. It is not enough simply to call their attention to their leaving their stuff out to be damaged by the weather, but you have got to be able to figure it out for them what that damage amounts to in dollars and cents and what it will save them every year by caring for and putting it under shelter.

Get Together in the Campaign.

It would be well if you could enlist the co-operation of your competitor in this effort, for it concerns him as much as it does you, and if you can do this you can work together in planning a campaign for waking up the farmers in the locality to the great loss they are suffering every year from this one cause, which is preventable. You cannot, of course, get out and see every farmer on his home place, and therefore I would advise using the local paper to reach them. If you are an advertiser there is no doubt but that the editor will freely publish something every week bearing on this subject. A constant reiteration of it in this way will attract the farmer's notice, and before long it will "get under his hide" and set him to thinking about his own neglect of his implements. When they become convinced that this is a losing game for them they will begin to do some figuring themselves and go to the lumber yard to see what it will cost for a building to shelter their implements.

When they do this you must be prepared to show them the plans and the cost of the cheapest form of a shed to something of a better character and costing more. The idea of having these different plans and estimates is to show each enquirer something that will be within his means to build at that time. Some of you who are not much acquainted with the details of building construction may call in one of your best carpenters to assist you in making out the bill of the items. He will readily do this for the chance of getting the job of doing the work. These several plans I would put a definite price on for the structure complete. Then the customer will know just what it will cost him. When the farmer is too busy with his work to stop it for building I would even contract to do the whole job, including the delivery of materials. This will apply as well to putting up other buildings on the farms, because there are lots of farmers whose intentions in the spring are to do some building in the fall. But when fall comes something has happened or conditions are not what were expected or they are too much occupied to do what they can get along without till another year. This latter reason is often the more prevalent, and is one that the lumber dealer should have the enterprise to take advantage of by saying:

"Here, Jim, if you haven't time to attend to it, I'll put that building just where you want it, and it will cost you complete just so much and no more."

This is what the future lumber dealer is going to do—sell buildings complete, just as the ready-cut and some lumber concerns are now doing.

Should Also Know Farming.

And, while I am on this point, I want to say to the younger men in the business, both dealer and his second man, that along with the knowledge of the lumber and building business should go a knowledge of the farmer's business as well, so that you can talk intelligently with any farmer about it. The taking of one or more of the farm papers would materially assist you in doing this. It would be more valuable to you than you may imagine, for your business is intimately connected with that of the farmer.

For a few years when I was running a country yard I was a correspondent of the Department of Agriculture for a certain part of my county, and I sent in regularly reports on the crop conditions in my district. To get a fair average I had to obtain information from a good many farmers. It made me a little extra work, but one can always find time for what he really wants to do. Don't forget that what I did in this proved of great value to me, for it led me to seek and obtain a lot of other information about the business of agriculture throughout the country. In time I got so I was well posted, and many of the more progressive farmers around there used to come to the office and talk with me on these things I was posted on. It doesn't hurt a lumberman's business any to have a good knowledge of the farming business and to be headquarters for all such information. Every young man now in the business who has the desire and ambition to be a man among men and a leader of thought and information in his community can be all this if he is not afraid of the work necessary to attain this position.

I some time ago arrived at the belief that a young man is fortunate who is running a yard in a country town, because nowhere else is there such an opportunity to develop himself. He has not a particle of competition in this respect. His business touches upon nearly every other business in the town and his opportunities for personal acquaintance in the town and roundabout are limited only by the population. It does not require a large town to develop a big man. The smaller the town the better it is for him, if it is above the size of a hamlet. His opportunities lie all around him for him to grasp, and in developing them he develops himself. That which a man does himself is the only true development, because it comes from within and works outward, like the germ in a kernel of corn. If your town is small there are as many people in the surrounding country as there are in the territory of the larger towns for you to get acquainted with and cultivate. These are the potential buyers of the commodities you handle. When I speak of the farmers I mean also the farmers' families, and their good-will is as essential to you as that of the men folks. I am giving you young men this little preachment because I know it is common among young fellows in business in the country towns to think they are living in a contracted sphere for their abilities, and their ultimate ambition is to get into a large place, where they imagine they can spread themselves to greater advantage. This may be true in some lines of business, but it is different with the lumber dealer, for his business calls for a wider range of knowledge and information than almost any other, and the possibilities for personal development are practically unlimited, to say nothing of increasing his business.

Now Is the Proper Time.

There is no time of the year that people think so much of building and making repairs as they do in the early fall, for the near approach of winter compels them to turn their attention to preparing for it, and therefore they are more open and amenable to suggestions of this nature. Then, again, most people have a little more money at this time than they do in the spring. And, taking these two considerations together, gives the lumberman his greatest opportunity, and he should do his greatest stunt in advertising instead of letting his efforts decrease in this regard. It is the greatest mistake lumbermen can make to lessen their advertising efforts because trade is good at the yard, for, as I've said, this is the time to make suggestions, and as you can't get out to make a personal call on everybody, you want to make a lead of a lot of suggestive advertising that will reach and act upon those who are out of the range of your personal contact. For, let me tell you something: Every individual is constantly subjected to and is influenced by the power of suggestion. You don't think of a thing to do anything that is not the result of suggestion, either from outside influences or from your own thought. You know if you think of something it is almost sure to lead you to think of something else. Every one of your five senses is a constant source of suggestion. So if you read something about those things that relate to your personal interests you become interested, and it sets you to do more or less thinking of what you would not have thought of had not the medium of your eyesight suggested it.

This is the centre and core of all we term advertising—simply a medium for conveying suggestion through the eyesight to the mind, which never fails to respond, either consciously or unconsciously, and the degree of action resulting therefrom depends on the force and character of the suggestion. People with money in their pockets are more susceptible to the influence of suggestion. Therefore, farmers at this season of the year are more liable to act on suggestion than at other times. Not only are they in need of shelter for their machinery, but there are many other things in the way of improvements that they know they would like to have, but they lack the initiative that a strong suggestion would give them to act for obtaining them. It devolves on the lumber dealer, and should be his particular interest these days, to give out suggestions for these things in a manner that will start the farmer to thinking and looking around to see what he needs in the preparation for winter. Don't be satisfied with what trade people voluntarily bring you, but cultivate your territory for more.—C. H. Ketridge, in the Mississippi Valley Lumberman.

Poor Box Planing—Cause and Remedy

Too many people persist in clinging to the idea that any old kind of a planer will do for box factory surfacing and that any kind of knife grinding and setting will answer just so lots of lumber is put through the machine that will pass as having been planed.

The original cause for this whole family of wrong ideas for box factory planing comes from the fact that most of the lumber used in this country for boxes is low grade lumber and many of the boxes are cheaply made. In some other countries, down in Brazil, for example, a good grade of white pine is used for boxes and shipping cases, so the lumber and the work is on a somewhat higher plane. With us, while the idea of using low grade lumber helps in making a timber clean-up, it too often leads to indifference in the work. Really

"I'll Stand Back of It"

—Says Ye Old Miller

The only way you can test the baking merits of

Cream of the West Flour

The hard wheat flour that is guaranteed for bread

is to give it a trial in your camp. The full-flavored, nutritious, body building loaves Cream of the West makes, will instantly captivate every member of your camp. They will give them a sense of satisfaction after every meal, and be an incentive to them for the production of more and better work.

for Saw Mill work. They are made in an extensive plant built and equipped for the purpose with all modern appliances.

The three prime elements of Design, Material and Workmanship receive equal and most painstaking attention, ensuring a boiler warranted to give perfect satisfaction and long service.

The Jenckes Machine Co., Limited

Sherbrooke Montreal Cobalt So. Porcupine St. Catharines Toronto Vancouver Nelson

the right idea is to refine the low grade lumber and eliminate the defects so that the finished stock in a good packing box is good material of high grade. Also it should be well dressed.

For the better grade of boxes good planer work is essential to neat appearance and good printing, and even for the cheaper boxes where defects remain in the lumber a good order of dressing serves to improve the appearance enough to enhance the value of the package materially, and in that way to justify even a little extra cast. The fact of the matter is, however, that good dressing need not cost more, and frequently does not cost as much as poor dressing.

The two factors of importance in box factory planer work are smoothness and even thickness. The smoothness of the surface is desirable; first for the improvement it makes in the appearance, and second for the sake of good printing. Our best packing boxes have some very artistic printing done on them. The box sides and ends are made to do advertising service as well as serve the prime purpose of protecting goods in shipment.

It is the box printing that makes the other factor important, that of giving a positive, even thickness to the finished stock. The makers of box printing machinery have long complained that one of the trying problems comes from the fact that too often box stock coming from planers will vary in thickness, which makes it difficult to do good printing. The box boards not only will vary a little in thickness as compared to each other but some will be thick on one edge and thin on another, some will be thin on the end and thicker in the body and some will be wavy. All of these shortcomings make for poor printing; consequently every maker of box printers is persistently arguing for better planer work to the end that more artistic printing may be produced.

Some of the unevenness in planer work comes from stock that is dressed at different times. When the knives are fresh and sharp and cutting freely the machine is set up to a given thickness. By and by as they become dull and wear away a little the stock becomes slightly thicker. Then they are sharpened and set up again and may be adjusted to the original thickness and maybe to a thicker thickness from part of the recent run. So there is need to have some positive standards for thickness and to adhere to them religiously in order that box stock when it reaches the printer may vary but slightly in thickness.

One of the most common and troublesome faults in planing box stock lies in the careless adjusting of knives to bed plate which results in making stock thicker on one edge than the other. This makes proper printing very difficult, especially if the lumber is hard and unyielding, because to get an impression the dye or type must imbed itself on one edge or the printing will be very dim on the other.

Taking it altogether box factory planer work is really more exacting than cabinet work, or house trim. The surface of box factory lumber should be as neatly and smoothly finished as casing and base or as furniture stock, and in the matter of thickness it is more important to have exactness in the box factory than in millwork, because of the requirements for good printing.

Therefore, instead of regarding box factory planing as a line of work in which anything will answer so that it gets the stock through, we should really consider it as a work calling for the most up-to-date planers and the best order of planer service. Appearances count for quite a lot in box making as well as in other work and requirements of box printing make it essential to guard carefully the matter of thickness, and really in the end with modern machines it is no more trouble and expense to get good results than it is to do indifferent planing. It is simply a matter of good machines, kept in proper order, and this is one of the essentials to successful business anywhere.—Yates Quality.

Waste Tanbark Now Used to Make Roofing

A method for using waste hemlock tanbark to replace to some extent the use of expensive rag stock in the manufacture of felt roofing has been developed at the Forest Products Laboratory, Madison, Wis., and is now being used commercially by co-operating mills. It is stated that, in these mills, from 20 to 30 per cent. of the rags is being replaced by waste bark, and that the quality of the finished product is equal to that manufactured solely from rags. Members of the Forest Service who have been conducting the experiments say that the utilization of the bark will make it possible to effect a considerable saving in the manufacture of felt roofing.

In addition to the use of the bark for roofing, papers made at the Forest Products Laboratory on the basis of 80 per cent. tanbark have been successfully printed on a commercial twelve-color wall-paper printing machine, and give promise of being entirely satisfactory. Other paper of the same make-up has been made into fibre conduits by a commercial manufacturer.

Other possible uses of waste bark which suggest themselves are the use of bark mixed with ground wood for the production of wall board, or with sulphite screenings in the manufacture of car liners. Studies already made at the Forests Products Laboratory indicate that it may be possible to use waste hemlock and oak tanbark in making sheathing paper, carpet liners, bottle wrappers, deadening felt, and the like.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

EDGINGS

Ontario

The sawmill belonging to J. G. Stanley, Glencolin, Ont., was recently destroyed by fire.

John L. Focler, Philipsburg, Ont., has bought out the business of the Baden Lumber Company at that place.

The planing mill belonging to J. E. Butler & Sons, Vittoria, Ont., was totally destroyed by fire. The amount of the loss is estimated at $3,000, and there was no insurance.

The R. Laidlaw Lumber Company's plant at Sarnia, Ont., suffered a slight loss by fire recently as the result of a fire which wiped out the plant of the Ontario Canning Company.

The plant of the Canadian Woodenware Company, St. Thomas, Ont., which was recently destroyed by fire, will be rebuilt at a cost of $15,000. The manager of the company is Mr. A. J. Voege.

Ontario Toys Limited, which was recently incorporated, will manufacture a wide variety of toys in order to secure the Canadian market which has formerly been supplied very largely from Germany. The company also expect to be able to develop an important export trade. The incorporators include Wm. Webber, M. Swedlove, H. Paulin, A. C. MacNaughton and L. A. Maldaver, all of Toronto.

The Bishop Lumber Company, Limited, have succeeded the Thessalon Lumber Company, Nesterville, Ont., having taken over their mill and plant in the woods. They have secured also a limit of 36 square miles of virgin timber on the Mississaga River, in the Township of Otter, which was purchased from the Georgian Bay Lumber Company. H. H. Bishop, Chicago, is president, and A. E. Bishop secretary and treasurer.

A report from Port Arthur, Ont., states that an agreement has been signed between the city and an Eastern Ontario syndicate under which a pulp mill will be established in Port Arthur on the north waterfront, work to be started immediately. The mill is to have a capacity of 150 tons per day. The first unit of fifty tons will, it is expected, be producing next June. The company gets its site and buys its power from the municipality.

Between eight and nine hundred men employed by J. R. Booth in his pulp and paper mills at Ottawa were recently thrown temporarily out of employment owing to low water in the Ottawa River. The level of the river was lower than it had been for many years, and Mr. Booth had to close down all his pulp mills during the day time and could run only a small shift all night, owing to there not being enough water to cover the pulp grinders.

Eastern Canada

The Delisle Lumber Company, Montreal, P.Q., has been registered. The chief party interested is Mr. J. O. Delisle.

F. E. Jones, St. John, N.B., has been awarded a contract for a large electrical installation to be made in their Great Salmon River mill by the Pejepscot Lumber Company.

The East Coast Lumber Company, Mr. Roberts, manager, have erected a mill at Campbells, N.B. (near Eastern Head), for the purpose of manufacturing shingles, laths, boards, etc.

Fire recently destroyed the saw and planing mill belonging to Alric Archambault, St. Martine, P.Q. The amount of the loss is estimated at about $9,000, which is partly covered by insurance. The owner will probably rebuild and will require machinery for steam power.

Geo. A. Chappell and Claude C. Chappell have purchased from W. F. Beatty a tract of timber land at Second River, Colchester County, N.S., containing 2,300 acres, upon which there is a stand of 20,000,000 feet of spruce timber. The price paid was about $55,000. The Chappell's are starting operations at once with two mills and will cut between four and five million feet this season.

A report from Bangor, Me., states that the Partington Pulp and Paper Company, St. John, N.B., are disposing of their property both at St. John and throughout the province of New Brunswick to Maine and New York capitalists headed by Hugh Chisholm, president of the Oxford Paper Company, Rumford Falls, and Maynard S. Bird, of Portland, Ore. The price mentioned is more than $2,000,000. The sale is to include 500,000 acres of valuable timber lands. It is expected that the new concern will extend the plant at Union Point, St. John, and that they may install newsprint manufacturing machinery.

Western Canada

The Prairie Pulp & Paper Company, Limited, Winnipeg, Man., have been incorporated.

The 'Nag' Paint Company, Limited, has been incorporated with head office at Victoria, B.C., and capital stock of $30,000, to carry on business, among

other things, as timber and lumber merchants, sawmill and pulp mill proprietors and to buy, sell, manufacture and deal in saw logs, timber, lumber and wood of all kinds.

The Woodland Lumber Company has been incorporated with head office at Edmonton, Alta., and capital stock of $20,000.

Application has been made by Mr. Knox Walkem on behalf of the Western Logging Company, Vancouver, B.C., for a winding up order, with the unanimous consent of the shareholders.

J. S. Deschamp is considering plans for the erection of a mill near Slocan City, B.C., to cut lumber from limits on Goat Creek. It will also be necessary for him to construct a flume in connection with his operation.

H. M. Ellis Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $50,000, to carry on business as timber and lumber merchants, sawmill, shingle mill and pulp mill owners, loggers, etc.

The B. C. Trading and Transportation Company, Limited, has been incorporated with head office at Kamloops, B.C., and capital stock of $100,000, to carry on business as manufacturers and dealers in timber, lumber, logs, etc.

Farm Lands Investment Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $50,000, to carry on business as manufacturers and dealers in timber, lumber, shingles and all sawmill products.

The Coast Copper Company, Limited, has been incorporated with head office at Trail, B.C., and capital stock of $1,000,000, to carry on business as timber and lumber merchants, and as manufacturers and dealers in lumber, timber, saw logs, poles, etc.

The Quatsino Trading Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $20,000, to carry on business as foresters, loggers, timber merchants, shingle mill, sawmill and planing mill proprietors and as manufacturers and dealers in wood pulp, etc.

D. B. McDonald, who is the promoter of the Manitoba Power, Pulp and Paper Company, has announced that plans have been completed for the erection of a plant at Grand Rapids, on the Saskatchewan River. The scheme will represent an outlay of $2,000,000 and, according to Mr. McDonald, will include a sawmill, paper factory, pulp mill and hydro-electric plant. The pulp and paper mill will have a capacity of 100 tons a day.

The Prairie Pulp & Paper Company, Limited, has been incorporated with head office at Winnipeg, Man., to construct and operate pulp and paper mills. The incorporators include S. H. J. Montgomery, O. Montgomery, A. E. Hilder, C. Graham and B. Dixon, all of Winnipeg. The capital stock of the company is $200,000.

The sawmill at Sperling, Langley, B.C., owned and operated by B. John, a prominent Hindoo, and a company of his fellow countrymen started operations on September 21st, with a capacity of 35,000 feet per day. The plant is one of the most up-to-date small mills in the Fraser Valley. It is driven by electricity and the various machines are run by direct motor power. This method is employed at one other mill on the coast.

The Western Canada Lumber Company, with head office at Lethbridge, Alta., have sold ten of their southern Alberta yards to the Beaver Lumber Company of Winnipeg. The yards concerned are located at Garnum, Claresholm, Parkland, Stavely, Nanton, Cayley, Brant, Champion, Carmangay, and Barons. Mr. Peter Lund is the principal owner of the Western Canada Lumber Company. This company retains control of its yards at Macleod, Lethbridge, Medicine Hat and intermediate points along the Crow's Nest Railway. W. J. Gourlay is general manager of the Beaver Lumber Company, with head office in the Bank of Toronto Building, Winnipeg.

Barbados Market Report

S. P. Musson, Son & Company, Bridgetown, Barbados, in their market report under date of September 15th, write as follows:—Lumberstuffs—White pine—The position of the market is the same as last advised, no arrivals have taken place, and there is a good enquiry for later shipments which should sell to advantage. Spruce—There have been no arrivals in this either, and, as supplies are wanted, we can recommend shipments. Shingles—The S.S. "Chignecto" brought a small lot of 87,500 Selected Long Gaspe, to our address, which we sold at $8.19 duty paid, and we can recommend further shipments, as shingles of good quality are wanted. In cedar laying the market is temporarily supplied from recent shipments. Shooks and wood hoops—We note the receipt of 1,070 bdls. wood hoops by London steamer for dealer's account.

At a recent meeting of the Board fo Governors of the Hardwood Manufacturers' Association of the United States, at Cincinnati, it was decided to hold the fifteenth annual meeting of the association in Cincinnati on Tuesday and Wednesday, January 30 and 31, 1917, at the Sinton Hotel.

Canada's exports of forest products for the twelve months ending August were as follows:—1916, $55,044,835; 1915, $45,658,916; 1914, $42,593,099.

These men wake up refreshed and ready for hard work, because they sleep on comfortable, sanitary ALASKA Double Deck Steel Bunks.

Sanitary Steel Bunks for Your Men Mean Dollars in Your Pocket

You know the economy of good tools, and you doubtless make a practice of buying on a quality basis, because the best is the most economical in the long run.

Are you just as particular about the equipment of your men's sleeping quarters? If your men sleep on old-fashioned, vermin-infested, hard, wooden bunks, you cannot expect them to go at their work with energy.

"Alaska" Sanitary Steel Double-Deck Bunks are absolutely vermin-proof; they are just as comfortable as a Pullman berth, because of their twisted-link fabric springs that "give" BUT NEVER SAG; and they are as rigid in frame as a steel bar.

Easily knocked down for shipping, and as easily set up. Light, yet strong. Guaranteed to give satisfaction. With Alaska sanitary mattresses and pillows, they make the ideal combination for sleep comfort in camp.

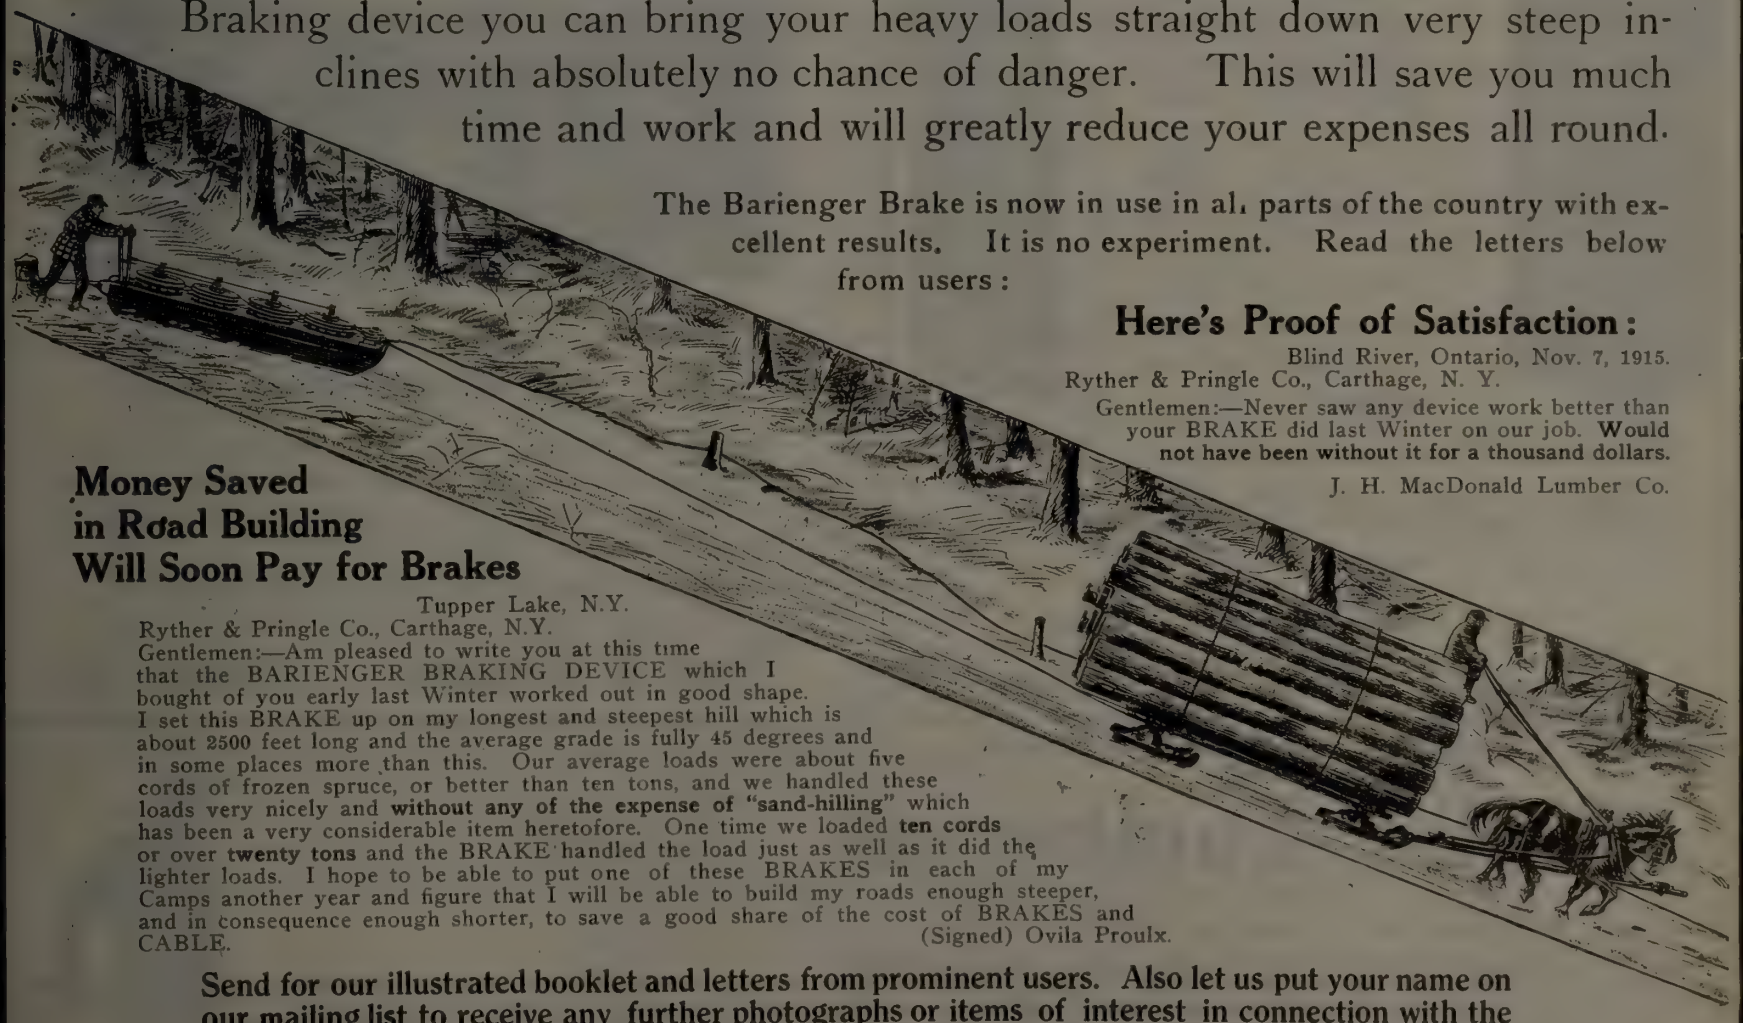
Canada Lumberman & Woodworker
347 Adelaide St. West, Toronto

Overcome Labor Shortage

The present labor shortage is going to seriously affect every lumberman in Canada. Costs of logging and all camp work will be much higher than ever before. Now is the time for Camp Superintendents to look after every little economy possible and every idea for more work with fewer hands. One big step in the right line would be the installation of a

BARIENGER BRAKE

If you work in hilly country or have any upland logging to do you will be counting on some extra expense for winding roads or on sand hilling, straw hilling or whatever means you propose using to bring your loads safely to shipping points. Any of these methods are costly and slow and require much labor. Not only that, but the chance of accidents to men and horses is ever present. With a Barienger Braking device you can bring your heavy loads straight down very steep inclines with absolutely no chance of danger. This will save you much time and work and will greatly reduce your expenses all round.



The Barienger Brake is now in use in all parts of the country with excellent results. It is no experiment. Read the letters below from users:

Here's Proof of Satisfaction:

Blind River, Ontario, Nov. 7, 1915.
Ryther & Pringle Co., Carthage, N. Y.

Gentlemen:—Never saw any device work better than your BRAKE did last Winter on our job. **Would not have been without it for a thousand dollars.**

J. H. MacDonald Lumber Co.

Money Saved in Road Building Will Soon Pay for Brakes

Tupper Lake, N.Y.

Ryther & Pringle Co., Carthage, N.Y.

Gentlemen:—Am pleased to write you at this time that the BARIENGER BRAKING DEVICE which I bought of you early last Winter worked out in good shape. I set this BRAKE up on my longest and steepest hill which is about 2500 feet long and the average grade is fully 45 degrees and in some places more than this. Our average loads were about five cords of frozen spruce, or better than ten tons, and we handled these loads very nicely and **without any of the expense of "sand-hilling"** which has been a very considerable item heretofore. One time we loaded **ten cords** or over **twenty tons** and the BRAKE handled the load just as well as it did the lighter loads. I hope to be able to put one of these BRAKES in each of my Camps another year and figure that I will be able to build my roads enough steeper, and in consequence enough shorter, to save a good share of the cost of BRAKES and CABLE.

(Signed) Ovila Proulx.

Send for our illustrated booklet and letters from prominent users. Also let us put your name on our mailing list to receive any further photographs or items of interest in connection with the famous Barienger Brake. Booklet is free and there is no obligation whatever in writing for it.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,
December 20th, 1912.

MONEY!

An article which may be used as a universal passport to everywhere except heaven and as a universal provider of everything except happiness.

In your plant where many men are employed ***their minutes*** represent ***your money.***

Let an International Time Recorder check up the three great factors of men, minutes and money.

The International is a fiend for accuracy and a child for simplicity. It deals justice to every employee in your plant.

Of the 260 styles of International Time Recorders one is particularly suited to your business. Prices from $100 up.

"AMPHIBIA"

Planer Belting

Amphibia Planer is one of the very few brands of Leather Belting that will give really satisfactory service in the Lumber Industry.

The results of exposure, oil, grease and greenwood on ordinary leather, renders a very special waterproof tannage absolutely necessary when preparing the leather for transmission purposes.

"Leather like gold has no substitute."

A mere description of this process as used in Amphibia Planer would not convince you. What you want is results. You want continuous wear and perfect power transmission on every shaft and pulley.

Hundreds of large firms are securing this service right now with Amphibia. We believe you are just as progressive as the best in the country and we want you to try a sample run of this better leather belting.

IT'S WATERPROOF

Write us today. Say under what conditions you want the belt to run. We will recommend an Amphibia Leather Belt for your purpose that will break all your previous records for economy in full power generated and transmitted and in low up-keep.

The Lumberman's Milk
IN POWDER FORM
KLIM
READ BACKWARD

Klim is pure—cheaper than fresh liquid milk. One-third the cost of condensed milk. No freights on useless water—keeps in any temperature—no waste. Packed for camp use especially in 10 pound tins $2.00 each, the pound makes one gallon. Case lots, special price.

Write for samples, etc.

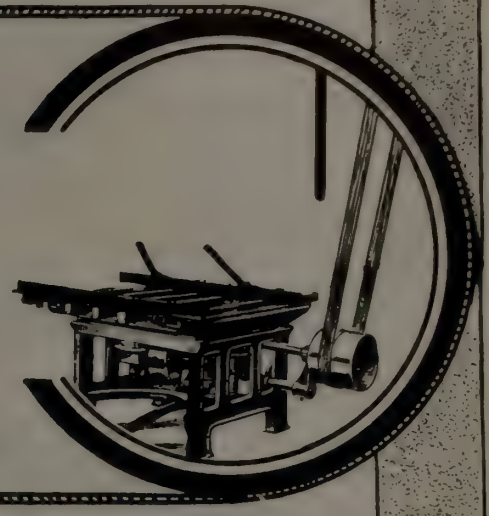
GOODHUE BELTING



FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue."

According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service.

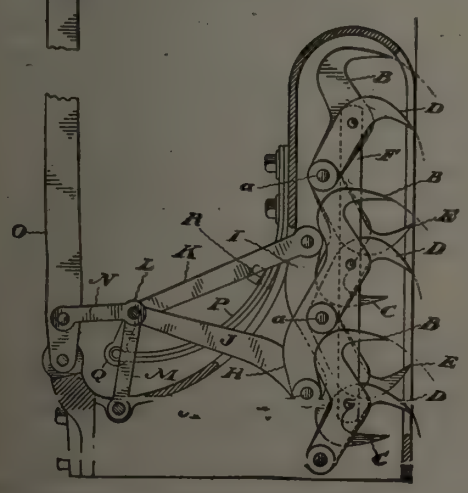
A Boon to Lumbermen
Payette's Famous Patent Mill Dogs
650 Sets already sold

Fig. 1.



BECAUSE

(1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves, Five different classes and styles of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

He Was "Stuck" On His Tract

Once there was a man who had what was reputed to be an exceptionally valuable tract of timberland — no matter where — which he bought on an old-fashioned "timber cruise" plus his personal inspection.

Wishing to take his profit on the investment he confidently offered the tract to James D. Lacey & Company.

Besides the reputation of the tract there were superficial indications of unusual excellence: but Lacey & Company deal only with THE FACTS.

A LACEY REPORT on the tract showed the astonishing fact to be that the value of merchantable timber on the tract was barely more than half what the intending seller sincerely believed he had, although he was an experienced lumberman.

He was "stuck"—badly; in fact a "LACEY REPORT" on the property when he bought it would not have cost a twenty-fifth of what he was "stuck." This is a true story—with a moral. May we send you "Pointers," an interesting booklet?

This Valuable Book sent all Belt Users for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

Iron Saw Frame

For a simple, substantial machine that will stand up under long service and a heavy lumber production, we have no hesitation in commending the machine herein described and illustrated, as having made good under the severe tests of actual service.

Note particularly the simplicity of design, the accessibility of every part, and the full adjustment provided for.

The frame, or bed, of the machine is made in a single casting of the hollow box section, heavily ribbed and absolutely rigid. This facilitates the installation of the machine and insures a proper relation of parts being maintained. All the parts of the machine rest on planed surfaces and are bolted through the top of the bed casting. To get at these bolts, large hand holes are left on the inside of the machine; one of which can be seen above.

Ask us for catalogues and prices

The E. Long Manufacturing Company, Limited

Orillia - Ontario

Built to take a 6-inch cant and it will, easily. Opening 40-in., 48-in., and 56-in.

'NEW CHAMPION' EDGERS

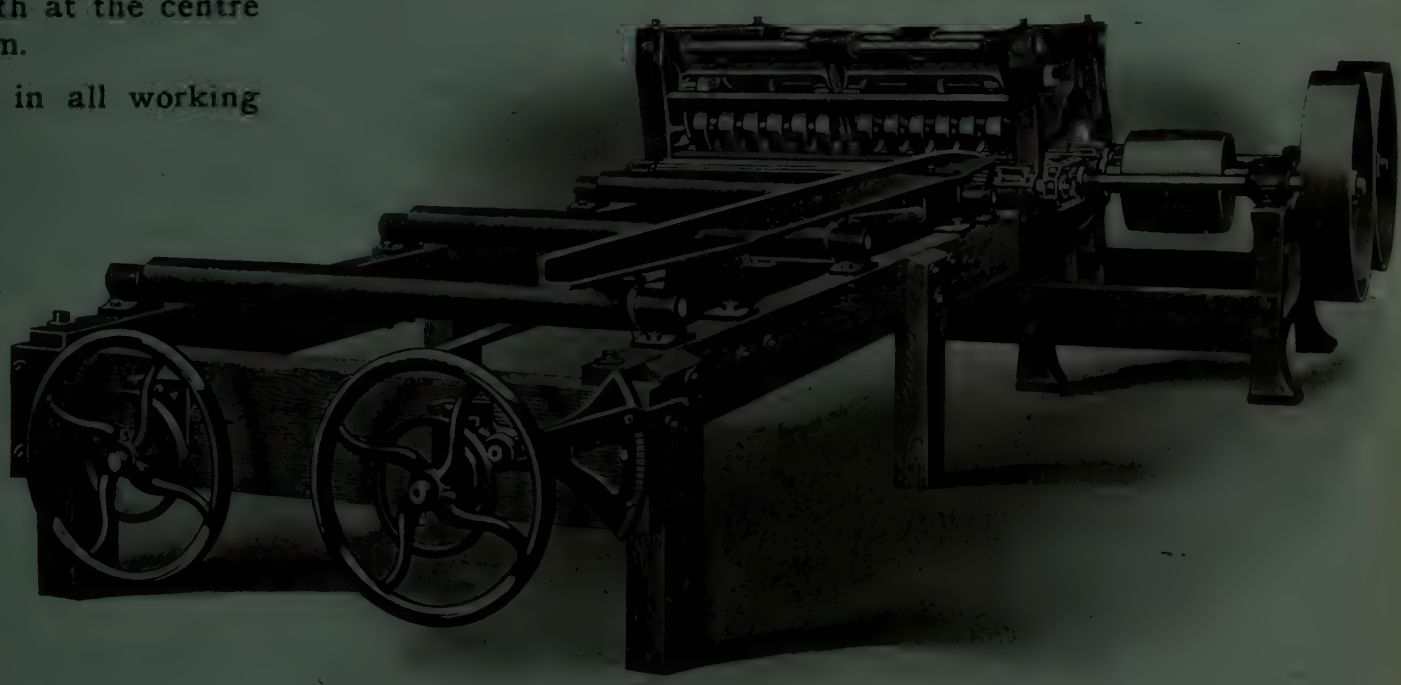
Have 3 Points of Superiority—that *mean* something

1—***A Locking Device***—that crowds the saw guides into correct position automatically and locks them there.

2—***Double Contact Saw Guides***—that hold the saw blade both at the centre and at the rim.

3—***Extra Strength*** in all working parts.

These three features mean—correctly edged lumber, smooth edged lumber, and lots of it.



A 6-inch cant will go through this machine as easily as a 2-inch plank, and will come out edged to a hair.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

J. M. T. Reducing Valves

PATENTED

We offer the one successful valve that will positively reduce the steam pressure from boiler to required power and keep the lower pressure even, continuously. In constructing this latest type reducing valve we have gone over every previous good idea along this line, and our present type has proven absolutely reliable under all conditions. We sell the J. M. T. Reducing Valve under a positive guarantee. Send for illustrated folder, giving method of operation, prices, installations, etc., of this valve.

The Long Lumber Company

HAMILTON, ONT.

FOR SALE: Machinery and Timber

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Burpee, Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Automatic Grinding Machine for 8-in. S.C. band saws.

1 Hand Machine for cut-off saws.

1 Lap Grinder.

1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws.

POWER PLANT

2 Double Duplex, high pressure Water Pumps.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Mitts & Merrell Hog.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 Edger for ripping dry lumber, not installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

Arrow Head Curve Ground Cross Cut Saws

Made by R. H. Smith Co., Limited, St. Catharines, Ont.

VANADIUM STEEL Best for Saws

Arrow Head Saws are manufactured from Vanadium Steel, which is the highest grade Saw Steel made. Vanadium Steel will take a higher temper and hold a cutting edge longer than any other steel. All the steel we use is subject to a searching chemical analysis so that it is practically impossible for any defective material to go into **Arrow Head Saws.** Then the accuracy of our grinding machines and the skilled workmanship employed enable us to make an absolute guarantee that the **Arrow Head Saw** will cut 20 per cent. more in the same time with the same amount of labor than any other saw made.

CURVE GROUND. What it Means

Curve Grinding is an exclusively Arrow Head process and is superior to any other method. Our process adds strength and makes the operating of the saw very easy. The teeth of Arrow Head Crosscut Saws are of an even thickness and gradually taper back 5 gauges at the centre of the saw, which means that less set will be necessary and less kerf to cut. For ease and speed in working and long service **Arrow Head Saws** will be found superior to all others.

We specialize in Shingle, solid, inserted tooth Circulars, Gang and Cross Cut Saws. Goods of Quality.

R. H. SMITH CO., LIMITED, St. Catharines, Ontario

—a combination that can not be beaten—

Simonds Crescent Ground Cross-cut Saws in the woods and Simonds Wide Bands, Solid Circulars, Inserted Point, Gang, Shingle, Edger, and Trimmer Saws in the mill. Famous for quality among Lumbermen the world over.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, November 1, 1916 No. 21

Fostering the Timber Trade—Science and Tariffs

An address upon "The Empire's Timber Trade" was delivered recently before the Timber Trade Federation of the United Kingdom, by Professor Groom, M.A.D.Sc., in the course of which several references were made to subjects of interest to lumbermen in Canada. After a reference to the importance of co-operation between technical science and industry, the speaker said it was now widely accepted:—

(1) That our industries shall be fostered or protected by some means of tariff or duty.

(2) That the British Empire shall utilize its resources to the maximum possible, which may involve a tariff policy known as Colonial Preference, for trade within the Empire.

(3) That whether or not tariffs are introduced there must be the closest co-operation between scientific and practical work.

There was the question as to whether timber grown within the Empire should receive a preference. No doubt most of the countries within the Empire would agree upon some form of preference. At the present time the nation was generally in favor of utilizing the resources of the Empire. The trade should set about preparing its case at once so as to be ready with a propaganda after the war. The trade had already experienced how the government tackle timber affairs, and would know whether they wanted that to continue in the future. If the trade decided to take action the time had arrived to set about carrying it into effect, and a strong committee should be appointed to deal with the matter.

The question then arose as to how technical science could assist industry and contribute to the fullest utilization of the timber resources of the Empire. A piece of wood in the forest was worth 3s. per cubic foot. When turned into mechanical pulp, it was worth 7s 6d. Turned into chemical pulp, it was worth 15s. Turner into paper, its value was 35s, or in wood pulp yarn 45s, but when turned into artificial silk it was worth £7 10s. That would afford them some idea of the value of technical science. In 1913 we imported coniferous wood sawn into logs amounting to £23,000,000, pitwood £4,500,000, woodpulp £5,500,000, oak logs £1,750,000, manufactured wood of various kinds £4,500,000, hardwood £4,000,000, making a total of £43,000,000. Of that £43,000,000 the country lost most of the wastage in cutting the wood. Researches had shown that the waste material could be utilized to great advantage. Another large portion of the timber was lost by decay, such as in pit-props for coal mines, and timber used for building. Increased preservation of timber would save a large amount of money. The British Empire lost a considerable amount of money every year through importing timber not grown within the Empire.

The British Empire included a wider range of woods than was possessed by any other empire in the world, and research was urgently needed into the qualities of the lesser-known woods grown within the Empire. Some were very light in weight, and others were very heavy. Some might be regarded as useless for timber, through being unobtainable in sufficient quantity. At the present time Great Britain imported huge quantities of coniferous timber, some of which might be grown at home, although it would take forty years to do anything in that respect by means of afforestation, but the fact remained that a large amount of money could be saved by simple research into the preservation of timber, in order to prevent premature decay, either in coal mines or in buildings. In 1913 they imported woodpulp to the extent of 5,500,000 pounds, most of which should have been manufactured at home.

Douglas fir when fumed with ammonia assumed a most artistic brown color, and in fact it was a good method of treating this wood. Until now the wood-dyeing industry had almost exclusively been carried on abroad, so that when a man wanted certain kinds of false ebony he bought them in France or Germany, whereas they could produce it from applewood of about 3s per foot, but when it had been converted into false ebony abroad it usually realized about 25s per foot. The making of false ebony was an extremely cheap and simple process.

A comprehensive scheme required the services not merely of the timber technologist, and the practical timber merchant, but also of engineers, chemists, and the practical workmen connected with the industry. The work required not only the laboratory, but also the results from the workshops. The government had recently published a White Paper in regard to their views of scientific research as affecting the industries of the country. He thought an Imperial Bureau should be established in London, having not merely a timber department, but a well-staffed, well-equipped chemical, physical, engineering, and fuel departments, as well as workshops. The bureau would be in the closest touch with the various countries of the British Empire, and every facility for obtaining technical advice and practical advice. Probably various works would co-operate by allowing their plant to be used for carrying out practical tests, and by co-operation a well-thought-out scheme would not only be of national benefit, but of Imperial benefit.

Finance Minister Takes a Hand in Price of Paper Controversy

At a recent conference between Sir Thomas White, Minister of Finance, representatives of the Canadian pulp and paper industries and the Canadian publishers, a discussion took place regarding the price of paper which has been advancing rapidly with the prospect of still further advances. Sub-committees of the pulp manufacturers and the publishers were appointed and these met at the call of R. W. Breadner, the Dominion tariff expert, to endeavor to reach some basis of contract price for the coming year. At the conference the news print men quoted figures for renewed contracts at from 50 to 60 per cent. higher than those now obtaining. It was admitted that the figures were not based on the present cost of production, but the anticipated cost, and the conditions under which the pulp industries expected to operate. Sir Thomas White asked the publishers what they had to say regarding the matter. Their reply was to the effect that their worst fears had been realized, which showed that the home price was not below the obtainable foreign market price. The Minister of

Finance suggested that representatives of the two industries should get together and hold a conference. He intimated that if the conferences were not successful the government would be forced to take the matter up and deal with it. Sir Thomas pointed out that the newspaper industry was at all times a semi-national institution and that in times such as the present it was more than ever essential to the country as a whole.

As the Canadian publishers see the situation it resolves itself into a matter of giving them, as Canadians, the right to keep prices at a reasonable level, allowing for a fair profit above the cost of production, instead of permitting paper to be exported so extensively to the United States as to enhance the price in Canada to levels which they consider unjustifiable. During the fiscal year ending March 31st, 1916, Canada increased her exports of paper by about $5,000,000. During the twelve months ending June, 1916, Canada's exports of paper were valued at $21,250,296, of which $17,759,018 went to the United States and the balance to Great Britain. During the previous year the exports were valued at $16,200,635. Exports of news print paper from Canada to the United States during July, 1916, were valued at $1,534,795, where as in July, 1915, the value was $1,218,321. In addition to paper Canada exported to the United States pulp wood valued at $6,102,170 and wood pulp to the value of $10,793,647.

That these exports constitute an important source of supply of raw material for United States publishers is unquestionable and is clearly shown by a reference to the subject in an editorial in "The Paper Mill," of New York, which says:—

"The Canadian newspaper publishers have exerted their influence on the Canadian Minister of Finance to compel the Canadian paper makers not only to amply supply them with paper, but also to do so at a fixed price, and the Minister of Finance has instructed the paper mills to that end. Canadian paper mills must first supply the home requirements. This means that American newspaper publishers who have succeeded in securing Canadian paper now face the prospect of having that source of supply cut off. This is but one of the difficulties that are in prospect. English publishers have been casting ravenous glances at Canadian paper going into the United States and are planning to secure that paper for their own needs. Arrangements whereby the entire Canadian output would be turned over to the exclusive use of Canadian and English publishers at a price set by the British and Dominion governments are within the realms of possibility.

"With American newspaper publishers depending on Canada for more than 1,000 tons of paper a day, the loss of this avenue of supply would be a severe blow. The American mills are unable to supply more than 60 per cent. of the country's need, and while the clamor for print paper now is insistent and loud, one can imagine what will be the case should Canadian mills be compelled to abandon selling paper to this country."

A further conference has been held since the above was written and the paper manufacturers have held out for for the minimum price of three cents a pound which they quoted formerly. The publishers conceded that some increase might be necessary but that a minimum of 3 cents a pound would be prohibitary. No agreement could be reached, and the request of the publishers for a government investigation into the matter stands.

Optimism on the Loose But Well Meant

The Peterboro Review, Peterboro, Ont., in a recent issue contained the following interesting editorial:

"A Boom in Lumbering:—Labor agents of the big lumbering companies of Ontario are offering men $45 a month to work in the woods, with the prospect that the pay will be increased to fifty or sixty dollars before the end of the season. One company in Parry Sound district intend to operate six camps during the winter. This would call for nearly seven hundred men to fill all the camps. So far the company have not been able to secure the services of more than twenty, although they have agents out in every part of the province.

"The condition of the lumber trade is always at this time of year an excellent barometer of the business situation. If that industry is depressed, the same is likely to be the case in every other line. Only one year ago the operations were limited and wages did not exceed $22 a month, as men for that work were plentiful.

The present boom in the lumber business is cheering, indicating as it does a revival in the building trade, practically dead since the beginning of the war, next summer. Normal industrial conditions are likely to be restored, a satisfactory assurance, in view of the fact that even if the war is continued, labor will be employed less and less in the manufacture of munitions.

The scarcity of labor and the consequent abnormally high rate of wages means that the price of lumber when the mills start on the cut for 1917 next spring is likely to be higher than ever."

While we would like to look at things through the same rosy glasses as the "Review," we are not quite sure enough of the situation to do so. We rather imagine that the "Review" is confusing cause and effect to some extent. The high wages paid to the men in the bush is the result of their scarcity, not of an exceptional demand for their services. In fact the extent of operations in the Northern Ontario woods during the coming winter will be reduced by from 25 to 60 per cent., according to reports we have received from many quarters; so it is "going some" to speak of "a boom in lumbering," and to argue from it that the building trade is on the eve of a revival, and industrial conditions about to become normal. The "Review" has allowed the wish to father the thought. All of us would be glad to agree with its conclusions if we could, but the best that a lumberman in Ontario can do at present is to agree that, even with a dull market next year, prices of lumber must advance, because of the increased cost of labor, of food, and of everything else contributing to the cost of manufacturing logs and lumber.

Canadian Crops for 1916

The Canadian Census and Statistics Office has published the second or provisional annual estimate of the yield of the principal grain crops of Canada in 1916. The reports indicate that the areas estimated to be unproductive of grain are, if anything, larger than those already deducted; but, pending further enquiries, no change has been made in the harvested areas as reported last month. The results now provisionally estimated are a total yield of wheat of 159,123,000 bushels from a harvested area of 10,085,300 acres, a yield per acre of 15.78 bushels, as compared with 29 bushels last year and 15.67 bushels in 1914. The total yield of oats is now placed at 338,469,000 bushels from 9,795,000 acres, a yield per acre of 34.55 bushels, as against 45.76 bushels last year and 31.12 bushels in 1914. The yield of barley is 32,299,000 bushels from 1,328,800 acres, or 24.31 bushels per acre, and of rye 2,058,500 bushels from 101,420 acres, or 20.30 bushels per acre. For the three prairie provinces the estimated yield of wheat is 138,542,000 bushels, of oats 232,409,000 bushels, of rye 659,000 bushels, of barley 22,862,000 bushels, and of flaxseed 7,707,000 bushels. The yields of remaining crops are reported for the first time this year as follows: Peas, 2,166,000 bushels from 150,280 acres; beans, 541,400 bushels from 32,500 acres; buckwheat, 6,720,000 bushels from 341,500 acres; flaxseed, 7,759,500 bushels from 710,000 acres; mixed grains, 10,333,000 bushels from 397,770 acres, and corn for husking 6,271,000 bushels from 173,000 acres. For peas, beans, buckwheat, mixed grains, and corn for husking these acreages represent the areas actually harvested after deduction from the areas sown in Ontario and Quebec of proportions estimated to have been entirely unproductive through drought.

Correspondents were asked to report on the quality of the grain crops at the time of harvest, as measured against a standard of 100, representing grain well headed, well filled, well saved, and unaffected to any appreciable extent by frost, rust, smut, etc. The average results

for the whole of Canada are as follows: Fall wheat, 78; spring wheat, 68; all wheat, 70; oats, 75; barley, 72; rye, 84; peas, 66; beans, 74; buckwheat, 71; mixed grains, 74; flax, 76, and corn for husking, 67. In Manitoba the quality of spring wheat is 44 per cent.; in Saskatchewan it is 60, and in Alberta it is 73. The estimates of quality are high in the Maritime Provinces and in British Columbia, the average for Canada being reduced by rust in Manitoba and Saskatchewan and by drought in Quebec and Ontario.

The condition of root fodder and crops is about the same as a month ago, the average points in percentage of a standard or full crop ranging for all Canada from 71 for potatoes and sugar beets to 77 for fodder corn.

Wooden Freight Car Regaining Favor

The rapid substitution of steel freight cars in the place of wooden cars, which was taking place up to a few years ago has apparently been checked by the great demand for steel for other uses and the consequent difficulty in getting delivery. A return to the wooden freight car is being reported by many of the large railroads, and, now that they have had a good trial of the steel car the wooden car is likely to get a better reception than formerly.

Railroad companies, after several years use of steel cars have commenced to wonder whether there is any profit in pulling a 60,000 pound car around the country when a 30,000 pound car will serve equally well. Investigation based upon actual operation has proved that wooden freight cars, with properly distributed metal parts, would save the railroads millions of dollars annually in coal consumption, wear on wheels and other parts of the under portion, and in avoiding the hauling of unnecessary weight. This statement is made on the authority of Ralph Budd, assistant to the president of the Great Northern Railroad. Mr. Budd adds that a few years ago, practically all freight cars of every type were almost entirely built of wood, but with the advent of the steel car, the demand for wood for certain types of cars received a severe setback. However, during the last six or eight months there has been an increasing demand for lumber for freight cars, possibly as a result of the shortage of steel or the difficulty of obtaining it for several months after orders. It is now generally believed that the wooden car had again come back into favor. On this subject Mr. Budd says: "From an operating standpoint a locomotive will handle 100 cars weighing 30,000 pounds empty as easily as it will fifty cars each weighing 60,000 pounds empty. There is no reason why cars should be built to weigh 100,000 pounds for goods of which you could not possibly load more than 20,000 pounds. Cars should not weigh more than the load they carry. General merchandise averages only five to eight tons per car, and to build cars of 80,000 pounds capacity to carry five to eight tons seems absurd."

It will mean much to the lumber business if Mr. Budd's ideas prove to be correct.

Editorial Short Lengths for Busy Readers

The Forestry Branch of the Department of the Interior have sent out a large number of blotters for distribution in schools and elsewhere. These blotters bear printed warnings as to the danger of fire and the value of timber, arranged in various appropriate forms for different classes of people, including a set of Simple Simon rhymes for the children. Incidentally the blotters are the product of the Forest Products Laboratory of Canada.

The Board of Trade of the city of Toronto are making an effort to alleviate the difficulties arising out of the scarcity of freight cars by urging their members to do everything they can to assist the railway companies in making prompt shipments. They have sent out a circular addressed to shippers and receivers of freight in which they say that Toronto is suffering from the effect of embargoes placed by the Canadian Pacific and Grand Trunk Railways against less than carload traffic from all points consigned to Toronto, as the result of the accumulation of freight within the terminals awaiting delivery. They urge shippers and receivers to assist in the following ways:—(1) by promptly loading and unloading all freight; (2) by cancelling any orders given railways that freight will not be accepted on certain days or at certain hours, and arranging to receive freight at any time during the working day; (3) by notifying railways and cartage agents, through the Board of Trade, that they will accept and ship freight on Saturdays until 4,30 p.m. The railways and cartage agents are prepared to handle freight on Saturday afternoons if merchants will so arrange. The Board is satisfied that much relief can be obtained by carrying out these recommendations.

The Dominions Royal Commission held several days' sessions in Toronto recently. On the concluding day one of the witnesses under examination was Prof. B. E. Fernow, Dean of the Faculty of Forestry at the University of Toronto. Dr. Fernow advocated federal jurisdiction over the licenses for cutting timber in Canada. At present, he said, each province regulated its own licensing system, and as a result there were wide differences between the laws of the various provinces. For instance, in Ontario a licensee could cut without limit, whereas in Quebec the operations were subject to a number of important restrictions. Dr. Fernow commended the work of the Forest Branch of the Department of the Interior in organizing fire protection on the Dominion Forest Reserves, and drew attention to the fact that Ontario had fallen far behind in its forest protection policy. Ontario was badly in need of a system of protection similar to that of British Columbia, which included lookout towers, telephones, trails and organized fire fighting forces. He said that Canada's total stand of commercial timber was between 500,000,000,000 and 600,000,000,000 feet, and that the cut in any one year had never exceeded 5,000,000,000 feet, so that the supply might be considered inexhaustible or at least reproducible, by merely keeping fire out of the forests.

An official statement by the Secretary of the National Lumber Manufacturers' Association, on the United States lumber production for this year, based on the comparative production and shipments of over 500 firms, in 1915 and 1916, is as follows:

The totals for the first eight months of 1916 compared with the same period in 1915 show the following:

Increase in softwood cut	13.4 per cent.
Increase in hardwood cut	14.2 per cent.
Increase in total cut	13.5 per cent.
Increase in softwood shipments	9.2 per cent.
Increase in hardwood shipments	30.0 per cent.
Increase in total shipments	10.5 per cent.

These reports indicate 13½ per cent. more lumber produced and 10½ per cent. more lumber shipped by the end of August, 1916, than at that date in 1915. Since car shortages and less favorable market conditions may result in a somewhat smaller production during the last four months of 1916 than during the last four months of 1915, it is possible that by the end of the year the total production will be in the neighborhood of 10 per cent. greater than in 1915.

The best estimate of the United States Forest Service is that the lumber production of the United States did not exceed 38,000,000,000 feet in 1915. On the basis of the statistics received by the Association it looks, therefore, as if the total production in 1916 would be in the neighborhood of 42,000,000,000 feet.

When Peace Comes—What About Trade?

Will We Be Prepared or Groping in the Dark?—The Situation as It Appears to Prominent Lumbermen and Bankers

No one subject is being more widely discussed by lumbermen to-day than the present trade situation and what it may be expected to develop into after the war. Realizing the great interest taken in this subject, particularly in the latter part of it, we have secured from a few prominent Canadian lumbermen and from one of the greatest authorities upon financial affairs in Canada their views upon the question. Every lumberman will be interested in these interviews and letters, and will benefit by reading them carefully. We would like to hear from others on the same subject. It cannot be discussed too much.

Sir Edmund Walker—An Interview With the President of the Canadian Bank of Commerce.

I THINK the surprising thing to-day is not so much what we are accomplishing as what we have accomplished in contrast to the position when the war broke out. You will remember that we were only a few months past the point of greatest expansion in the history of Canada, and that the difference between our exports and our imports and the interest of our indebtedness abroad had, at the end of our fiscal year, March 31, 1913, put us on the wrong side in international affairs to the extent of at least $425,000,000. When the war began it was perfectly evident that Great Britain must lend us the cost of the war, which, as a matter of fact, she did for part of the first year. At the end of the first year, however, we had improved our international position by about $130,000,000, and by the end of the second year we had reached a point where we were able to pay the interest on our foreign indebtedness and also pay the cost of the war, without much, if any, outside aid. Of course, we had some loans in the United States for ordinary capital expenditure, which could not be stopped suddenly; but, without any further help from Great Britain for our own war expenses, we began to lend money to Great Britain to cover part of the cost of the munitions we were making for her. That transition was a great accomplishment.

At the present moment we have been able to take up the second Canadian war loan issued in Canada for $100,000,000, and it has been subscribed practically twice over. That really means that outside of the banks there were subscriptions for one and a half times the amount, and in addition to that we have agreed to make a further loan for munitions, making a total of $150,000,000 from the banks, besides sums from the Canadian Government direct, which have not been disclosed to the public.

An Amazing Accomplishment.

Taken as a whole, this is is an accomplishment that amazes us all. You will, however, hear a certain amount of complaint from Great Britain that we do not take so large a percentage of Imperial obligations against munitions made here as we should. Now, if we were a neutral country, not at war ourselves, we could take perhaps 70 or 80 per cent. of the cost of the munitions made, in Imperial obligations, but it is only out of the proceeds of munitions made that we can pay the cost of our own war debt, and it is only what is left after doing that, which can be taken in Imperial obligations. The British public should understand that better than they do.

Let us consider the effect of making munitions from another point of view. When the war is over we shall have a great many factories equipped with plants which did not exist before. We shall have a great many existing factories which were more or less struggling with debt before the war, but which will now be free from debt and will be in possession of capital. In a word, we shall have a great accumulation both of money made and of plants created as a result of the munition contracts. That means that whatever industrial work we have to do when we face the peace conditions we will be infinitely better equipped in plant, in capital, and in experience of the working man than we ever were before.

The Transition Period.

What the period of transition will be from the moment the war contracts stop and the soldiers begin to come home until the time farther on, when our plants are employed to a normal extent, I do not know, and I think no one should trouble himself too much about an uncomfortable time that we must all pass through, the length and the weight of which we cannot any of us guess.

When the American War was over I think the national debt of the United States was about $3,000,000,000 and the private debt was about $3,000,000,000, making in all about $6,000,000,000 of foreign debt. I think about one and a half million men were to be let loose upon the labor market, and, clearly, in the view of almost everybody, the United States was ruined financially. There was apparently no possible way of meeting such a terrible situation as that. That was in 1865. It was about 1868 that business began to be talked of as pretty good, and it was in 1873 that the expansion of business reached the point that brought on the biggest panic that the country had ever known. So, you see, it took eight years in the United States to pass from the terrible moment of ruin following the war to a panic brought about by an orgy of business and high prices.

I frankly do not know how difficult our own situation is going to be, but I do know that we shall be able to face it better than ever before; and when immigration does commence to move it will go to that country which is the best specimen of modern democracy, which has the best climate and the largest available area of cultivable land in the world. The only other country to compare with Canada in this respect is Siberia, and it is not a modern democracy. People say that immigration will not come quickly to Canada after the war. It will certainly come from the United States when their time of depression arrives. In the United States they have been making a huge amount of money, and labor is already at a dangerously high point. When they stop making munitions they will have a surplus of population. Of course we shall only want those who are willing to go upon the land, but we shall represent opportunity in that respect. The United States has no land for settlement.

My own feeling is that when the war is over we may, of course, have to face a lean time; not a bad time, but a lean time, for some years, until we have adjusted all these plants and all this labor to our new conditions. We shall not be building on a great scale as we have in the past—that is to say, constructing transcontinental railroads, canals, great public buildings and other public and private works, and we may be slow, therefore, in getting up to a normal state, but we shall have behind us an accumulated wealth, and the West, which has got largely over its troubles and which is well on the way to prosperity, will go ahead, whether Eastern Canadian manufacturers are in the best of shape or not.

Conditions To-day and After the War, by Angus McLean, Bathurst, N.B.

It is a comparatively easy matter to write with reference to trade conditions as they exist to-day, but what they will be after the war it is hard to prophesy. So much depends on circumstances beyond our control, and also on circumstances which should be guided by the powers that regulate our foreign and domestic trade policy.

As to present conditions, all industries, including that of lumber production, are suffering from a shortage of labor, and there does not appear to be any relief in sight unless more female help can be utilized and the average efficiency of the present-day male laborer increased. Many concerns are now employing increased numbers of female operatives, with good results, and we believe that a further movement in this direction will help out very considerably. Although we are not aware that the experiment has been tried, we fully believe it possible for women and girls to make good even in lumber mills, where they could be put on work of a lighter nature. Experience shows that the female operative can do many things which have hitherto been counted beyond her skill and strength, and that she is really capable of outclassing the male in many fields where he has imagined himself supreme and unassailable. In shops where both sexes are working together, the girls' ability has been demonstrated, and this fact is having a very beneficial effect. The movement should be encouraged, and the female given every encouragement and opportunity to tackle any job she can prove herself capable of handling. The present inefficiency and indifference of the men-workers, due to the unprecedented conditions of the labor market, all in their favor, are notorious, and something should be done to teach the "sterner" sex a much-needed lesson. The crying need of to-day is for efficiency, so that we can produce to our utmost, and any movement to promote this end should be helped along. The lumber market at present is good, and a very large amount of stock would be moving at good prices if labor to handle it were available.

Owing to the foregoing, the cut of logs this winter is going to be much below the average, and, in addition to this shortage, the cost of production is going to be fully 25 per cent. above normal. Almost every article used by the lumberman has increased tremendously in price, as well as the cost of labor, and, unless the manufacturer can get

25 per cent. to 30 per cent. more for his product during 1917, he is going to be in a bad way.

There is every indication of a car famine this winter. The railways are not making anything like prompt movement of freight, and we fear a very serious condition will prevail as soon as winter is on us.

"After the war conditions" is a very different problem. No one knows when the war will end, or what is going to be the condition of the warring nations when peace arrives. So far as Canada is concerned, there is only one thing to do, and that is to prepare for the end by making the most of the present. The war is teaching us many lessons, some of which we seem slow to learn. One thing is sure, and that is our participation in the conflict is adding a heavy burden on our taxpayers which it will take years to discharge. We must, therefore, buckle to in real earnest, and make the very most of our natural resources, as well as train ourselves to the highest point of efficiency. There need be no fear as to the outcome if we only do our best and make such preparations now, so that when our boys return from the war they will find our house in order, and our government prepared, if necessary, to give employment on public works and improvements.

* * *

A Toronto Wholesaler's Views on the Situation After the War.

After the war we may look for a general slump in the prices of agricultural products and manufactured articles—in fact, probably a shrinkage of values all round; but not likely much shrinkage in the value of pine lumber. In ordinary times of depression there has generally been a diminished demand for lumber. The feature has been a lack of trade rather than a falling off in prices. Sales under such conditions would hang fire for a period of probably a year or two, but ultimately come back to former levels when better financial conditions warranted the consumption of lumber in improvements.

The chances are that those lines of business will suffer most after the war which have benefited most by the war. Lumber is not one of the commodities that have benefited unduly by the war, and I think we may safely say there has been no increase in price consequent upon the war. There may have been a larger demand than otherwise, but since lumber has not been enhanced in price in consequence of the war, it would seem reasonable to suppose that it will not depreciate in price after the war. These remarks refer chiefly to red and white pine, which are not subject to the same fluctuations as hemlock and yellow pine.

There is bound to be a shortage in the output of logs during the coming winter, for the reason that men are scarce, wages 50 per cent. higher, and supplies nearly 50 per cent. more expensive. These features will add to the cost of production at least $4 per thousand.

Now, even if peace should be declared suddenly, it is not likely that the men at the front could be returned to Canada in time to make up for the deficiency of labor in the near future. In the event of peace being declared, the soldiers will probably be kept under arms until peace negotiations are well under way, which is likely to take a year, and then, even by taxing shipping accommodation to the utmost, it would be almost impossible to bring all the men back to Canada within a year. It seems, therefore, that after peace is declared it will take one and a half to two years to restore labor to pre-war conditions. Thus the outlook for cheaper production of lumber for the next year or two does not seem promising. Of course, the demand may not justify the market price going up proportionately to the cost of production, but increased cost of production should bolster up the market value of the product.

Another feature tending to curtail the output is that manufacturers are hesitating to put large gangs into the woods this winter for fear that, even if they get the logs out, labor next spring may be so scarce that they will be unable to turn the logs into lumber. This would mean an investment lying idle for an almost indefinite period, with the added danger of depreciation in value of the logs.

Trade, Taxation, Dominion Federation and Canadian Shipbuilding

By Edward Harper Wade, Quebec, P.Q.

RESPECTING the conditions that will obtain after the cessation of hostilities, and the declaration and establishment of peace, there are many and widely differing opinions. It is quite impossible to predict with any degree of certainty when the war will end, or under what conditions peace will be declared, but one thing is already very evident, that the liabilities incurred during the war will remain without reasonable probability of their being reduced by indemnity. The interest on wasteful and unproduction expenditure will have to be paid by nations with lessened resources, or at best diminished capital. This can only be done out of increased revenue, which cannot be raised without heavier taxation. In many cases the merits or faults of direct or tariff taxation will not be worth discussion under the dire necessity of applying both to their highest possible productive limit. In tariff adjustment all questions of free trade or protection will receive little attention, when the main object is to obtain the largest possible revenue, which does not necessarily result from the highest scale of taxation. In direct taxation such a rate as encroaches on capital gradually dries up the spring at its source, or to use a homely illustration, kills the goose that lays the golden eggs. A high tariff and a low one are alike in being poor revenue producers, whatever else may be said in favor of either. There is a point at which the customs duty will yield the highest obtainable revenue, but it is not the mose desirable one from either a protectionist or free trade point of view, though the future Chancellor of the Exchequer or Finance Minister will have to seek diligently, and unswervingly apply it, regardless of representations or pressure from either side.

Future trade will inevitably be hampered by the tariff taxation of ourselves and others, yet it is from the results of increased foreign trade we can have the best assurance of meeting our future obligations and increasing the wealth of our country.

Our present foreign trade may be divided under three heads, that with the United Kingdom, that with foreign countries, and that with other portions of the Empire. Our trade with both the former is large and well established, and such further development as it is capable of has the attention of our business men, but our trade with the last is comparatively small, and although it has received special government consideration and attention does not increase very rapidly. The customs revenue from it is not so large as to be a matter of very great consideration or of the first importance. It is a business that seems capable of great expansion if due encouragement be given it, and specially if all obstacles to its growth be removed.

Dominion Federation

The present Dominions were formed by the drawing together under federal government of the provinces that now form integral portions of them. Each of these provinces formerly had its own customs boundary with the right of levying tariff duties. A great impetus was given to integral trade by the inclusion of the provinces in the common customs boundaries of the Dominions. Would it not be possible and advisable to go one step further in the same direction and adopt free trade between the Dominions, with some general exceptions, such as spirituous and fermented liquors, for example? The exceptions would be a matter of detail for discussion and adjustment, if the principle were agreed upon and adopted.

Would it not be possible to form a Dominion council to discuss such matters, the council to meet in London, so as to work closely in connection with the home government, but to consist entirely of representatives of the self-governing colonies in the first place? Such a body might find it possible for the Dominions, while detaining full power over their own tariffs, to give the United Kingdom a uniform customs preference, under whatever tariffs they severally adopted, of one-quarter, one-third, or one-half, as might be found satisfactory to all, and agreed upon. This would have the great merits of simplicity and uniformity without interfering with individual action.

With free trade between the Dominions not only would business increase, but the sentimental tie would be supplemented by that of mutual interest, not an undesirable thing, even to those who, like myself, believe sentiment is stronger than any other consideration. The loss of revenue would not be comparatively great. Our business men, and through them our entire communities, would get to know each other better and be more closely drawn together, while increased trade, advantages and wealth would benefit all, and that without any great loss of present revenues, or even of prospective revenue under present conditions.

Shipbuilding in Canada—A Great Opportunity

It is evident that for some time after the end of the war the present scarcity of tonnage will continue, enhanced rather than diminished, till matters adjust themselves. Troops and refugees will have to be sent home, building and repair material, especially timber, deals and lumber will have to be transported to devastated countries. Emigration will have to be provided for, and food supplies taken to various points. Not only this, but stocks of all kinds will have to be replenished.

Now Canada is doing very little to provide for such business.

While the United States and Japan are turning out merchant tonnage as never before, while all shipowners, especially neutrals, are reaping a golden harvest in spite of losses of vessels, we are building some schooners and an odd steamer. This is not because there is any scarcity of orders. It would not only be possible, but easy, to get these here as elsewhere, and get them readily on equal terms, but such shipyards as we have are generally busy, and not long ago congested with work, according to Sir George Foster. There is, however, an initial difficulty in the impossibility of obtaining the necessary steel for shipbuilding in any reasonable time.

Two Canadian companies own the finest deposit of hematite iron ore in the world, accessible for tide water shipment. One hundred and forty-four thousand tons of this were shipped to Germany and Holland in 1912-13. There are also at tide water enormous beds of coal in Nova Scotia, within a short voyage of the iron ore deposits. Why then should we not have an abundant supply of steel, and a shipbuilding industry similar to those of the Clyde and Belfast, in the Maritime Provinces or elsewhere?

Though the advantages or disadvantages of protection are debatable, yet it must be admitted that under certain conditions and properly regulated it may have its value to serve a special purpose. The defects of bonusing are obvious, but it may have its possible advantages under proper restrictions, such as a sliding scale, and the exaction of the return of the bonus on such goods as are exported, but either or both might be justifiable and even desirable if no other way can be found to utilize our national position and establish a great Canadian shipbuilding industry. Possibly government assistance in obtaining capital would be more efficacious than either, or might supplement one or the other or both.

Surely the problem admits of solution as the necessary raw materials are available under most favorable conditions, and at the close of the war employment must be found for present munition factory workers.

It is for the government to take immediate action, and for everyone to do his part in the development of so great an industry, each according to his ability.

Short Stocks and High Prices for Lumber

Good Trade for Those Who Have the Goods

By C. W. Wilkinson, Union Lumber Company, Toronto

My opinion is that freight rates will hold up for at least a year after the war. My reason for thinking so is that there are twenty vessels in the North Atlantic service. These twenty vessels, if they were all used for the carriage of troops, would take about 1,000 men to the vessel—that is to say, 20,000 men to a trip. They would make a return trip in about three weeks, and that would mean that carrying troops alone, they would require a year to bring back 240,000 men. Unquestionably they will be used for the bringing back of troops in preference to engaging in the freight or passenger business.

After the war business will be good in the export line from Canada, so far as the lumber trade is concerned, because the large majority of lumber used in Great Britain—in fact, in Europe—has formerly been produced by Russia—considerably more than one-half of the total consumption. If the war stopped to-morrow, Russia would have to disband her enormous army, and it would be a difficult matter to get enough men into the woods in Russia now to produce any lumber during the coming winter. If the war stops during the winter, the woodsmen could not go into the bush until next fall, and it would be the summer of 1918 before they had any lumber cut which could be placed upon the market.

In Russia there were large stocks of lumber before the war. At Riga, one of the most important shipping ports, there were 400,000,000 feet of lumber in stock when the war broke out. Some time ago over 200,000,000 feet of that had been commandeered by the Russian Government and used. Possibly by next spring the balance will be used up for local consumption. So much for what Russia produces; that country, however, will be the scene of much reconstruction after the war. Russia has been run over by the enemy, more than any other country, and therefore it will have to be looked after to a great extent.

Another large European lumber producing country is Sweden. Although not a large country, Sweden manufactures and exports a great quantity of lumber. In competition with Swedish goods, Canadian lumber gets the preference. Our red pine is worth more than Swedish reds. With anything like an even break, I would not be at all surprised if Sweden finds the competition of Canadian lumber a much more difficult proposition in the future than it has been in the past. Besides, it is not unlikely that Sweden will find a higher tariff against her among the allied countries.

Then, of course, there is the enormous trade that will develop in France. France was always supplied with lumber from other countries. She bought practically nothing from Canada, most of her supplies coming from Sweden and Russia.

It looks to me, therefore, as though the export lumber business after the war ought to be pretty good for those who have the goods.

Another thing that must not be overlooked is that it is becoming harder each year to take out lumber. Man power is becoming scarce and the cost of production is advancing. Even if the war were to end to-day, it would be two years before it would be possible to over-produce in Canada.

So far as local conditions are concerned after the war, I am under the impression that we will pass through a stage exactly like that which we experienced when the war started. Business was very bad at that time. There is no doubt that the country to-day is living practically on war business. The consumption of lumber to-day is, directly or indirectly, connected chiefly with something relating to the war. All of this business will come to an end when peace is declared, or shortly afterwards. No doubt the Government will not cancel all its contracts immediately. It will do what it can to smooth over the period of transition. A certain amount of time will be necessary, however, in order to equip plants for the old lines of business that we had before the war started. I do not expect, however, that we will have as much of a setback as we had when the war started. We will probably get our plants back to the regular channels quicker than we made the change into the new channels when the war started. After the war is over we will stop making shells, etc., and will take on the business of producing the ordinary requirements of life. Four hundred thousand men returning to Canada will then have to be fitted out with shoes, collars, ties, hats, and everything else they require, to say nothing of the houses they will occupy and the food they will eat. Their shoes, collars, ties, hats, etc., are all shipped in boxes, so there ought to be a good demand for boxes and lumber. As to the building business, it is pretty hard to come to any conclusion at present. You can hardly say what the outcome will be, because it all depends upon whether the other countries restrict emigration, a course which possibly they may adopt. The building situation will depend very largely upon the volume of immigration coming to Canada after the war.

I do not think that for years the ocean freight rates will get back to where they were before the war. The chances are that they will run for a year or a year and a half at pretty near the existing rates, with possibly a small falling off to somewhere about 75 per cent. of the going rate to-day. However, this situation is a hard one to analyze. It is even possible that the Government may take the matter in hand and establish rates, in order to prevent the development of a panic.

I expect that after the war stocks will be scarce for a year or a year and a half. It is only reasonable to believe that we will have some kind of a reaction that will affect us during the next two, three, or four years, and this might be expected to affect prices and demand in a number of lines. But for at least a year or a year and a half the lumber situation will be different, because of the shortage of stocks.

I think it is going to take a long time to get anything in the nature of over-production of lumber stocks in Canada after the war, because stocks to-day have been cleaned up so completely. To understand this point better, take, for instance, the engineering and building trades, which are the two biggest trades in Great Britain. These are practically at a standstill to-day. When the war is over these trades are going to take good-sized supplies of raw material, including large quantities of lumber and timber. When the war broke out these trades were well supplied with large stocks, but freight rates increased to such an extent that the commonest lumber soon reached the price of clear lumber before the war, and in many cases clear lumber was used for purposes for which formerly common only would be considered. I may illustrate this by a couple of examples. Before the war 3-in. white pine No. 1 deals were selling at £36 in Manchester for stock of average width. Last winter they were paying £36 for 3-in. spruce at Manchester. All the big stocks of good lumber in Great Britain have been absorbed, and as soon as the engineering and shipbuilding trades become active again they will have practically no stock on hand.

Moreover, it seems to me rather probable that there will be a preference for Canadian goods in Great Britain after the war. I would not be at all surprised to see Great Britain put in force a tariff the effect of which would be that other countries, whether enemy or neutral, will not be able to compete with us in the markets of Great Britain.

Advancing Prices—Will They Be Permanent?

Trade conditions with us have been fair this year. The demand has not been large, but prices have been firm and well maintained. It would appear to us that whether the volume of business be large or not, prices of lumber and lumber products must advance, as under present conditions no lumberman is able to estimate what it will cost him to replace any stocks he now has in his yard.

During the last twelve months the costs of production have increased to a much greater extent than lumber prices. We figure that labor and supply costs have increased on an average of at least 30 per cent., and that the efficiency of the labor we are getting has decreased at least an equal amount, whereas lumber prices have shown an average increase of not more than 12½ per cent.

We would not care to express any views as to what is likely to develop after the close of the war in the way of volume of business, but it would appear to us that there can be no reductions in lumber prices, and that there must be an increase, if present conditions continue, and at the present time it would appear that we can expect no reduction in supply and labor costs for some time to come.—Keewatin Lumber Company, Ltd., Keewatin, Ont.

Little Known Forest Products Widely Used

In addition to the ordinary uses of wood with which we are familiar, mankind is dependent upon the forest for a variety of products whose appearance does not indicate their origin, say members of the United States Forest Service. Numerous as these products are, and as extensive as is their use at the present time, science is constantly learning new constituents which enter into the makeup of wood, and is finding new uses to which these constituents and those already known can be put. Powder for munitions or blasting, disinfectants for protection against contagious diseases, and artificial silk for clothing are among the products obtained in whole or in part from wood.

Charcoal, as everyone knows, is essential for the manufacture of black powder. All of the acetone used as a solvent in making nitrocellulose powders is derived from acetic acid, a product of hardwood distillation. Great Britain, it is said, is dependent upon the United States for acetone used in making cordite. Black walnut is a standard for gunstocks, and has been so much in demand for the past two years that the supply of this valuable wood has been considerably reduced, and other woods, notably birch, are being substituted. From Europe comes the complaint that there is a shortage of willow for making wooden legs.

Pure wood alcohol is the only substance which can be converted commercially into formaldehyde, which is universally used for disinfection against such contagious diseases as smallpox, scarlet fever, and tuberculosis. The experts at the Forest Products Laboratory have conducted extensive experiments on the production of grain or ethyl alcohol from wood, and have been successful in experimental work in raising the yield and lowering the cost of production. If this process can be put on a commercial basis, the foresters say, it will result in putting the millions of tons of coniferous sawdust and other material which is now wasted every year to a profitable use.

By converting cellulose, one of the elements of wood, into a gelatinous material, known as viscose, a wide field is opened up for the utilization of wood waste, and a new line of products, varying all the way from sausage casings to tapestry, is added to the already lengthy list. Many of the so-called "silk" socks, neckties, and fancy braids now on the market contain artificial silk made from wood.

About nine-tenths of all the paper which we use is made from wood. Besides the detailed investigations of the methods of making newsprint paper, and of the production of paper from woods hitherto unused for that purpose, which have been conducted, kraft paper, which compares favorably with the best on the market, has been produced experimentally at the Forests Products Laboratory from longleaf pine mill waste. This kraft paper is brown in color and is very much stronger than ordinary papers. It is used for a variety of purposes, and, cut into strips, is spun or twisted into thread, which is then woven into onion and coffee bags, matting, suitcases, and wall covering, similar to burlap, and furniture closely resembling that made from reeds, as well as other articles of common use.

Within the past year the Forest Products Laboratory has, by cooperating with manufacturers, succeeded in getting a dye made from mill waste of osage orange put on the market as a substitute for fustic, which is imported from Jamaica and Tehuantepec.

Shipments of lumber east bound through the Sault Ste. Marie Canals during the six months ending September, were as follows:—U. S. Canal, 1916, 240,703,000 feet B.M.; 1915, 318,819,000 feet B.M.; Canadian Canal, 1916, 10,696,000 feet B.M.; 1915, 34,249,000 feet B.M.

F. E. Miller, an extensive lumber dealer of Grand Rapids, Mich., recently made a business visit to a number of British Columbia points to enquire into lumber trade conditions. Mr. Miller reported good trade conditions generally throughout Michigan.

From the Canada Lumberman of Thirty-five Years Ago

Consumption of Lumber in Toronto.—(From our own correspondent.)—I have been endeavoring to collect a few statistics relating to the retail lumber trade in this city, but find it exceedingly difficult to procure figures that can be fully relied upon. The reasons for this may be explained as follows: Upon interviewing A, he gave me a long column of figures purporting to be a correct statement of his sales from the yard during the year 1880. Upon enquiry, however, I found that included in this statement are sales by car load, made by him to B and C, who are also yard men, but had bought several cars from A to retail from their yards, A happening to have the particular kinds of lumber they needed. Upon making application to B and C, they in turn informed me they had also sold considerable by car loads to other retailers, all of which was comprised in the figures handed me as being yard sales. Other retailers informed me they could not give me the quantities they had sold, but could give the figures in dollars and cents, so that to obtain figures that may be taken as reliable is simply impossible.

Another serious disadvantage under which the retailers labor here is the want of organization or cohesion amongst themselves. They seem to view each other with a kind of suspicion and distrust, so that each man, so to speak, runs on his own track, heedless as to what his brother chip may be doing. As witness the following experience when visiting a few of the yards: Questioning the first I called upon as to what price he obtained for joisting and scantling up to 16 ft. lengths, his answer was $11 per M; on repeating the question to No. 2, his reply was $11.50 per M, and No. 3 stated he would not sell under $12 per M, so that it virtually seems to be a matter of go-as-you-please amongst them. Now, this is certaintly not as it should be, and nothing tends more to demoralize the trade than such want of unity; but if a lumbermen's exchange was once in proper running order, so that grades could be properly established, prices regulated, and dead-beats shown up, and, in short, a thorough interchange of ideas take place between one another, it would certainly be greatly to the advantage of all concerned.

Another evil under which retail men are laboring here, and one which could easily be abated by acting in concert, is the custom in vogue amongst mill men of supplying consumers by the car load, at rates as low, or nearly so, as that charged to the retail trade, even going the length of bringing down half a car for a consumer and disposing of the remaining half car to the retailer. Now, this is certainly unsatisfactory, both in principal and common justice, to the retail men, and the yard men could soon apply the remedy if thoroughly in earnest. Doubtless some of your readers will remember the tactics used by the retailers in Chicago to remove the same trouble, and in which I believe they were thoroughly successful. It operated in something like the following manner: After notifying the wholesale men that hereafter they (the retailers) would demand a royalty of $— per car, according to grade, on all lumber sold to consumers, they calmly waited and watched. Some of the wholesalers laughed and derided at the demand as something preposterous, but those who disregarded the demand soon found to their cost that they had not all the laugh to themselves. The retailers simply blackballed all such, which meant nothing more or less than this: We purchase no more lumber from you until you accede to our demands; and in this way the remedy was prompt and efficient, and there is no reason why the same means could not be adopted and carried out here, and to the ultimate benefit of all concerned. The lumberman is generally termed the prince of good fellows, but sometimes there crops out amongst the best of them a slight disposition to grasp at all the trade within their reach, and this is more often the case among wholesale men, so that, in dull times especially, the course taken by them in the matter of selling to consumers has driven many of the retailers to the wall and has ultimately been the cause of considerable loss to themselves.

During the year 1880 there has been sold from the yards here, in round numbers, 30,000,000 feet lumber, 13,000,000 shingles, 15,000,000 sawn lath, and, in addition to this, there has been sold by car loads to consumers, direct, as much more, besides a considerable quantity sold by the factory men, who all do more or less of a retail lumber business, and the sales of the present year bid fair to far outstrip those of its predecessor, as buildings are springing up in every direction; and it is much to be regretted for the future of Toronto that many buildings now being erected by speculators are of such material and workmanship as not to add to the future glory of this, the Western Metropolis. Still, there are a number of quite pretentious and substantial buildings now going up; and one thing to be noticed is, that the architects are now demanding that all lumber used in the construction of good buildings shall be fairly dry, so that this will necessitate a much larger stock of lumber to be kept on hand by retailers to meet the demand in this respect.

Cost Finding for Millwork Factories

A Standard System Worked Out in Co-operation by a Large Number of Plants—Applicable to Large and Small Manufacturers Alike

Most of the articles that we have been able to publish of late in regard to cost accounting have related to the retail lumber business. We have seen very little in the way of information about millwork cost accounting. Lately, however, we have received a copy of a booklet entitled "Standard Cost Finding System," issued by the Millwork Cost Information Bureau, 1309 Lumber Exchange Building, Chicago, which contains a description of the system of cost finding adopted by the bureau in connection with millwork factories. There are so many varieties of millwork cost accounting that anything in the form of a definite and practical system which can be applied alike to all millwork factories, whether large or small, must be valuable, as it will help to produce uniformity of methods and enable millwork factories to analyze their costs according to scientific business principles.

The system adopted by this bureau is the result of the co-operation of all its members. It does not represent anyone's individual ideas, but the best features of all systems have been studied and a new system drawn up upon the most modern and practical lines. The bureau has not only adopted the system for the use of its members, but also undertakes to furnish accountants for the installation of the system, having found that the help of their accountants is necessary in order to start a firm off properly, and that it is really cheaper to install it thoroughly in this manner than to attempt to do so without such assistance.

The introduction to the description of the system states that, in addition to actual expenditure, allowance is made for interest on capital at 6 per cent. If the turnover is three times per year, this only amounts to 2 per cent. of sales. It also allows for depreciation on buildings and equipment. If proper depreciation has been allowed prior to the time of installation, or if buildings and equipment are new, it allows the following amounts per year: 3 per cent. on brick buildings, 5 per cent. on wood buildings, 10 per cent. on equipment.

Any method of distributing expense to individual orders or operations that accounts for every item of expense incurred in the running of a business is worthy of much respect. On the other hand, no matter how fair the distribution may be to the various classes of product, a system that does not account for every dollar spent is very misleading, and, therefore, a dangerous proposition.

Many cost systems charge direct material and direct labor to the individual job and distribute all the balance of the cost (burden) equally to all classes of product. There are four methods commonly used.

Method I.

Burden Equals 200 Per Cent. of Direct Labor.

Example No. 1.

1,000 lineal feet Moulding.

Direct material Y. P.	$15.00
Direct labor	3.00
Burden at 200 per cent. of labor	6.00
Cost	$24.00

Example No. 2.

1 Book Case Pedestal.

Direct material	$ 1.00
Direct labor	4.00
Burden at 200 per cent. of labor	8.00
Cost	$13.00

By this method the burden on one pedestal using $1 worth of material is more than on 1,000 feet of moulding, using $15 worth of material. Suppose example No. 1 used mahogany in place of yellow pine, material would value approximately $75, and the burden would still be $6.

Method II.

Burden Equals 50 Per Cent. of Material Value.

Example No. 1.

1,000 lineal feet Moulding.

Direct material Y. P.	$15.00
Direct labor	3.00
Burden at 50 per cent. of material	7.50
Cost	$25.50

Example No. 2.

1 Book Case Pedestal.

Direct material	$ 1.00
Direct labor	4.00
Burden at 50 per cent. of material	.50
Cost	$5.50

By this method if the moulding (example No. 1) is mahogany the material would be approximately $75.00 and the burden $37.50, in place of $7.50. The pedestal (example No. 2) is ridiculously low. This is not an extreme case of cabinet work. Practically all cabinet work would be too low.

Method III.

Burden Equals $50 per M of Material Used.

By this method moulding and all machine work would be high and cabinet work low. The small footage in example No. 2 (pedestal) would result in a burden as ridiculously low as Method II.

Method IV.

Burden Equals 40 Per Cent of Direct Material and Direct Labor.

Example No. 1.

1,000 lineal feet Moulding.

Direct material Y. P.	$15.00
Direct labor	3.00
Total	$18.00
Burden at 40 per cent. of material and labor	7.20
Cost	$25.20

Example No. 2.

1 Book Case Pedestal.

Direct material	$ 1.00
Direct labor	4.00
Total	$5.00
Burden at 40 per cent. of material and labor.	2.00
Cost	$7.00

If the moulding were mahogany (example No. 1) the material would be approximately $75, and the burden, 40 per cent. of $78 equals $31.20, or $24 more than Y. P. Thus we see that the more expensive the material the more the burden, and where the material is a small factor of the cost (example No. 2) the burden is low. This method makes cabinet work too cheap.

From the above it is apparent that no method of distributing all the burden in one operation is correct for all classes of product.

General Outline.

There are two classes of material. Direct material is that material which is practical to charge "direct" to the individual order, such as lumber, glass, etc. Indirect material is all other material, such as nails, glue, screws, sandpaper, etc., and is included in burden, as explained later.

There are two classes of labor. Direct labor is that labor which is practical to charge "direct" to the individual order, and, as explained later, should be separated as to "machine" and "bench." Indirect labor is all other labor, such as oilers, foreman, office, etc., and is included in burden, as explained later.

"Material burden" is all indirect labor, indirect material, and expense that the material uses up to the time it is sold or is "work in process."

"Machine burden" is all indirect labor, indirect material, and expense that the machinery operation uses, as explained in Chart No. 3.

"Bench burden" is all indirect labor, indirect material, and expense that the bench operation uses, as explained in Chart No. 3.

"Commercial burden" is all expense of every nature not already charged to the above three burdens, but does not include freight allowance on outgoing shipments and credits allowed (which should be deducted from the price realized). It includes delivery or shipping expense.

Direct material, plus material burden, direct machine labor and direct bench labor, and any other labor charged directly to the individual job, makes "prime cost."

Prime cost, plus machine burden and bench burden, makes "factory cost." Factory cost, plus commercial burden, makes total cost.

The sizes of the areas of the various items of cost in Chart No. 1 show the relative values of the burdens. Of course, material and labor areas would vary for different factories, but the purpose of Chart No. 1 is to show the principal factors in cost and the approximate relation burden bears to material and labor.

Material Cost.

There are two classes of direct material—lumber and other direct material.

"Lumber Burden."—Every item of expense that lumber occasions up to the time it is taken to the saws (or sold) is the lumber burden.

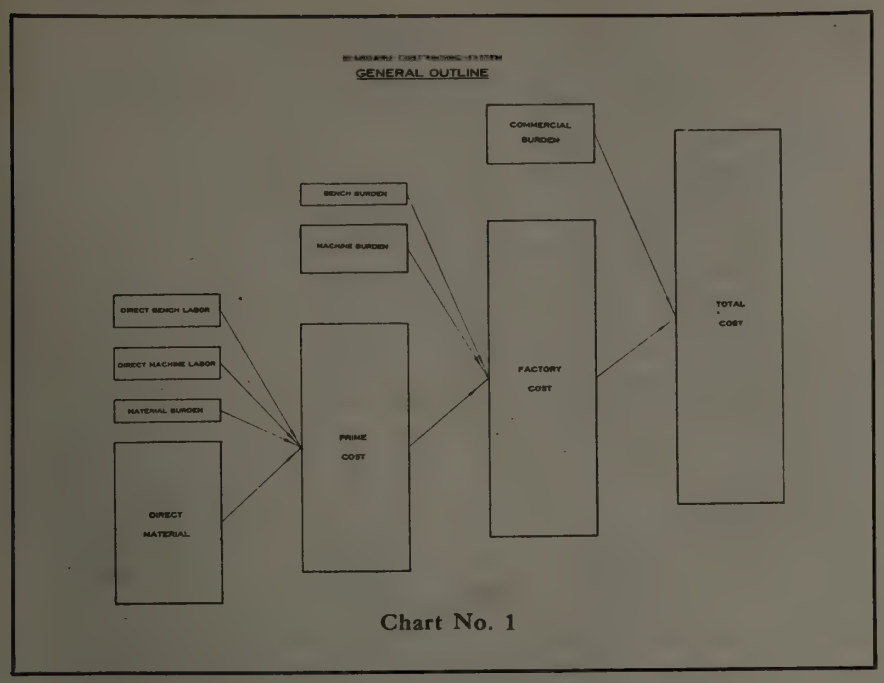

Chart No. 1

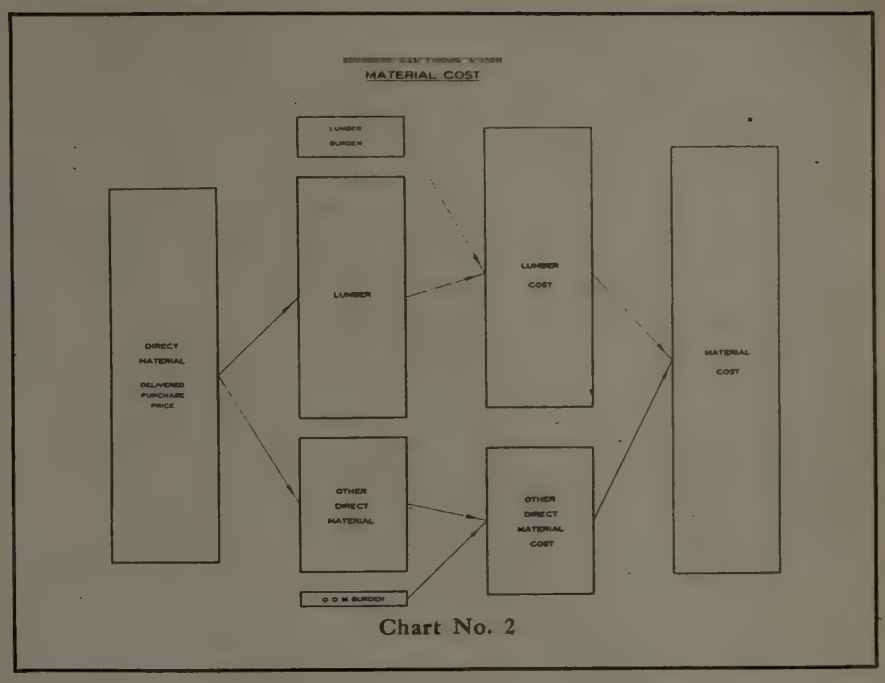

Chart No. 2

Lumber burden, divided by the number of feet of lumber handled, equals the average amount per thousand to add to lumber. As explained later, the burden on yellow pine, which costs approximately $30, and may not have to be kiln dried, is much less than on mahogany or quartered oak costing four or five times as much and requiring kilning.

Lumber burden includes the following:

All labor in yard and kiln and liability insurance for same.

Interest, taxes, and insurance on value of average stock carried.

Interest and taxes on ground occupied by yard, sheds, and kiln.

Interest, taxes, insurance, and depreciation on shed, kiln, and equipment.

Maintenance and repairs on shed, kiln, and equipment.

Such part of power plant expense properly chargeable to kiln.

Such part of barn expense used in handling lumber.

Such part of office expense used in purchasing lumber.

The delivered purchase price of lumber and lumber burden equals the factory cost of lumber.

"Other Direct Material Burden." — Other direct material is of three classes—glass, stock, and material ordered special for the individual order. This burden is arrived at in the same way as lumber. Stock would include a carrying charge on the value of the average stock, in addition to the items of expense that special material would carry. The burden on glass, in addition, should absorb certain supplies, such as putty and points. Glazing time is direct labor.

In small mills where it is impractical to divide the stock in this way, and where there is very little stock carried, it would be more simple and very nearly correct to consider all direct material, other than lumber, to require a carrying charge of, say, 10 per cent. of the invoice price of same. Do not forget that the direct material does not include office material, repairs, and supplies, and also do not forget that the factory cost of material, as shown by Chart No. 2, is not the total cost, as it does not include the commercial burden.

Labor Burdens.

"Machine Burden."—Machine Burden is the amount you have to add "per hour" to each direct machine man's wages to equal the sum of the following:

1. All of the expense that the machinery operation directly occasions (or machine expense).

2. Machine man's portion of such other factory expense not occasioned directly by the bench operation (or factory expense).

"Machine expense" is that expense peculiar to the machinery operation. It includes the following: Such part of power plant expense properly chargeable to machinery, carrying charges on machine investment, indirect machine labor, maintenance and repairs on machines, and depreciation. This is the cost per hour of running each machine (not including wages paid machine man). Floor space is taken into account in the factory expense. Depreciation of machinery is included at 10 per cent. In planing mills making special work we do not recommend different machine burdens. Although all machines do not occasion an equal amount of the machine expense, we recommend not to exceed two machine burdens in the odd-work factory. In planing mills where any machinery operation is specialized it may be necessary to use more than two classes of machine burdens, according to conditions, as explained later. In factories manufacturing both stock and odd work it is necessary to use "department burdens," in which case each department is treated as a separate factory and the machine burden determined for that department, exactly the same as Chart No. 3, and distributed "equally" to all machines in that department.

"Factory expense" is all factory expense that cannot be charged "direct" to the machinery or bench operation. We recommend that factory expense be distributed to machine and bench burdens on a basis of "direct hours." Machine expense plus machine men's portion of factory expense equals machine burden.

"Bench Burden."—Bench burden is the amount you have to add

Chart No. 4

"per hour" to each direct bench man's wages to equal the sum of the following:

1. All the expense that the bench operation directly occasions.
2. Bench man's portion of such other factory expense not occasioned directly by the machinery operation.

Commercial Burden.

All of the expense incurred in disposing of the factory product is "commercial burden." Certain items of expense have already been charged to material, others to labor, and the balance is "commercial burden." The best method of applying the commercial burden to the individual order is the percentage method. The percentage necessary to add to the factory cost to equal the total cost is determined, and this same percentage is used in costing individual orders. For planing mills and most sash and door factories one commercial burden is sufficient. However, in some organizations the expense of disposing of the factory product varies so much that it is necessary to determine more than one commercial burden. For instance, carloads are sold to jobbers and branch houses not entailing any salesmen's or estimators' expense. Mixed cars are often sold by salesmen, not entailing any estimators' expense. Shipping expense is charged to all classes of work as commercial expense based on factory cost. General expense is all expense not previously charged or specified in Chart No. 4, and is charged to all classes of work based upon factory cost. The commercial burden for plan estimates equals salaries of plan estimators and draftsmen, its share of the following: Salesmen salaries, shipping and general expense; for list estimates, salaries of list estimators, its share of the following: Salesmen, shipping and general; for open orders and mixed cars, its share of the following: Salesmen, shipping and general; for jobbing, salaries of those who devote their time to jobbing, its share of the following: Shipping and general.

Lumber Burden.

Refined on basis of "value" and "treatment."

Our standard distribution of expense contemplates only one lumber burden, which is an average cost of handling all lumber used. This is correct for all practical purposes for planing mills doing a general millwork buisness. The factory manufacturing both stock and odd work should determine the cost of handling the lumber for both classes of product.

Interest, taxes, and insurance on average stock of lumber vary per thousand feet in accordance with "value" and turnover. Consequently, these three items would be different on a thousand feet of Western pine than on a thousand feet of quartered oak. Therefore, these items are based upon the delivered purchase price of lumber. As they rarely amount to over 3 per cent. of the delivered purchase price, it would be unnecessary to determine more than one lumber burden, unless you manufacture stock extensively, in addition to millwork.

Kiln and planer expense may not be necessary in the treatment of certain kinds of lumber. Consequently, the stock factory charges these items only against those kinds of lumber using same.

In this way various lumber burdens are determined in accordance with the value and treatment. One average lumber burden is practical and fair to the millman. The only reason the stock factory needs more is it is cheaper to handle the lumber he uses for stock manufacture, and if he does not determine various lumber burdens he will burden his odd work with too little and his stock work with too much expense.

Machine Burden.

Refined on basis of value of machine and power used.

Our standard distribution of expense contemplates not more than two machine burdens. Interest and depreciation, also power expense, vary for different machines. In an odd-work factory not specializing on any particular product it is unnecessary to have more than two machine burdens. Most of the products made use both small and large machines. Factories manufacturing both stock and odd work should use more than one machine burden. The investment varies about in the same proportion as the power used, so for all practical purposes the power plant and machinery expense can be distributed to machines on the horse-power basis. More than two or three machine burdens would be unnecessary, because all products would use some of each class, and any inequality would be evened up.

The best and most accurate division of power plant and machinery expense is to determine the total horse power of, say, the stock door department—that is, the power used by all machines making stock doors—and determine one burden for all these machines. This will give you the average cost of running each machine used in manufacturing stock doors, and as they are all used in the same proportion the total costing will be accurate. This is more fully explained under "department burdens." Unless you specialize or manufacture stock extensively, do not make the mistake of using more than two machine burdens.

Department Burdens.

As explained under "Machine Burden," the power plant and machinery expense is determined for the entire door department. The other factors making up machine burden, such as indirect labor, indirect material, and floor space, are less per machine hour in the door department than in the cabinet department. Consequently the total machine burden is determined for the door department, and this amount divided by the machine hours gives the amount of burden on each machine used in making doors.

It often happens that some of the machines in the door department would be utilized to make other products than doors. You must remember that the machine burden in the door department is an average burden of all machines in that department, and, just because some of these machines were available for other uses, is not sufficient reason to use the door burden in costing these orders. In other words, after the burden is determined for making doors this burden should be used only in costing door orders and the burden determined for cabinet work used only in costing cabinet orders. Orders made under unusual conditions should be burdened only with the usual expense determined for that class, as in no other way is it possible to build an average cost. An unusual high or low cost on an individual order is lost sight of, unless it is distributed evenly against all orders of that class—which will be done in determining the burden from time to time to meet these conditions. The selling expense on an order consisting of one carload of doors might be ten times as great as on another order of like amount, but both orders would be costed, using the same commercial burden, and the only effect of an unusual condition like this would be its effect upon the commercial burden to be used in the future. It would surely be lost sight of in any other way.

This method of department burdens used by classes makes it possible to determine the result of manufacturing each class by the month. It is not necessary to debit and credit material to departments. The material used on each class is figured from the cutting bills. This saves an endless amount of work, and makes it possible for you to know accurately your profit or loss on each class of work.

If you do not manufacture extensively stock doors or sash, do not make the mistake of using department burdens.

Method of Applying Burden.

Rates used will, of course, vary in different organizations.

Example No. 1.

1,000 lineal feet Moulding.

Direct material Y. P.	$15.00
Lumber burden at $4.50 per M feet	1.50
Direct machine labor	3.00
Machine burden at 35c per hour	3.30
Factory cost	$22.80
Commercial burden at 20 per cent. of factory cost	4.56
Total cost	$27.36

Example No. 2.

1 Book Case Pedestal.

Direct material oak	$ 1.00
Lumber burden at $6 per M feet	.10
Direct machine labor	1.00
Machine burden at 35c per hour	1.10
Direct bench labor	3.00
Bench burden at 20c per hour	2.00
Factory cost	$8.20
Commercial burden at 20 per cent. of factory cost	1.64
Total cost	$9.84

Turn back and compare the four incorrect methods, formerly used, with our methods shown above. To the cost of the lumber on cars we add for labor handling up to factory door; also all yard and kiln expense. This establishes the price for lumber charged to the various jobs. No one can question that in so doing we are placing that part of the burden exactly where it should be. Example No. 1 takes care of its share of the burden, and would do so even though mahogany were used in the place of yellow pine. Example No. 2 is consistent, as very little lumber is used, and, consequently charge for lumber burden is small.

Now look at the machine burden. To the actual wages paid operator is added the established rate per hour to cover its portion of machinery and factory expense, and in so doing the machinery and factory expense is distributed on jobs requiring machine work in the exact proportion used. Cabinet work or trim will carry its proper part of the burden, no more, no less. To the actual bench wages paid is added the established rate per hour to cover its portion of factory expense. Thus all factory expense, exclusive of power plant and machinery expense, is distributed equally to the machine and bench operation on basis of direct hours, and consequently the burden on bench work will take care only of the correct portion of the expense used. To the factory cost is added commercial burden on the percentage basis, based on factory cost.

Fire Prevention in Dominion Parks

Portable Fire Engines with Remarkable Capacity Adopted by Government—Prevention Methods in Use

One of the most active government departments in the struggle against the destruction of timber by forest fires is the Dominion Parks Branch of the Department of the Interior, Ottawa, which is under the direction of Commissioner J. B. Harkin, and has given a great deal of study to the prevention and fighting of forest fires in the Dominion parks. The branch has now adopted a portable fire engine which gives remarkably good results. Most of the Dominion parks are located in the heart of the Rocky Mountains, partly in British Columbia and partly in Alberta, and the problem of transporting the fire engine in such a broken country was a very difficult one to solve. In an address recently delivered before the Commission of Conservation, Mr. Harkin, referring to the portable forest fire engine, said:

During the last year our special activities in fire protective work have related chiefly to the development of a portable gasoline fire engine for putting out fires when they occur, and to a campaign of education calculated to prevent the starting of fires.

In regard to the engine, I think it needs no argument to convince anyone that the surest way of putting fire out is to apply water. In forest fire fighting it is well known, especially in a mountainous country, that very little can be accomplished with buckets. It is a physical impossibility for men to carry water under fire conditions for any length of time, and it is equally true that usually when a man has climbed up a rough hillside with a bucket of water there is very little water left in the pail when he reaches the fire. It is the experience of nearly all who have been concerned in forest protection that most of the big fires are what are called secondary fires—that is, fires that have been placed under control once and left in charge of a watchman.

Very often a big wind storm comes up, carries the fire forward despite the efforts of the watchman, and a conflagration is the result. It was figured that if water could be got on such a confined area quickly and in quantity we could remove one of the most serious forest menaces. It was this that led us to figure on a portable gasoline fire engine.

It is obvious that light weight and high power are essential. A great deal of time and thought was given the subject. We were fortunate in securing the co-operation in this work Mr. J. C. Johnston, of the Railway Commission Fire Branch, whose mechanical aptitude and varied experience in fire fighting and fire equipment proved invaluable last spring. One engine was completed last spring. Its weight, stripped, is 118 pounds, and, equipped with solid oak base, etc., for work, 143 pounds. The engine is rated 6 horse power. It delivers 20 gallons of water a minute through 1,500 feet of hose. Assuming that it would take one man with a bucket ten minutes to deliver 10 gallons of water at a fire you will see that this engine will do the work of 200 men, and, of course, do it at insignificant cost. The outfit is provided with parallel handle bars, by which two men carry it anywhere.

There are narrow gauge trucks by which engine and hose can be taken by horse power over the timber trails. The engine in its field tests has exceeded our expectations. Let me read you some extracts from reports in this connection. J. E. Sibbald, chief fire and game warden, who was in charge of the engine part of the time, reported as follows:

The engine enabled us to burn the brush in large piles within a clearing of 40 feet in very dry weather without scorching the standing trees; also enabled us to keep fire from spreading along the ground and to entirely extinguish fires before leaving in the evening. Not on fire started up after being put out. We carried the water in one instance over a steep hill 200 feet high and along a clearing for 600 feet, the gauge showing a pressure of from 85 to 90 pounds. This enabled us, by holding the nozzle close to the edge of the fire, to make a ditch from four to six inches deep all round the fire from the force of the water. This will relieve us of digging a trench round a fire, as it is through the hidden roots that fires always spread.

C. Phillips, fire warden, who continued in charge of the engine, wrote:

The whole apparatus was given a very fair four-day test at the Alien Detention Camp at Castle Mountain last month, while the aliens were burning large piles of brush and small timber, and the pump undoubtedly kept the fire within the required area. Water was taken from the river and pumped through 800 feet of hose to points where required, varying from 50 to 150 feet above the water level. A pressure of 90 pounds was obtained at the outlet of the pump and a stream of water was thrown about 40 feet at the nozzle.

At a test in Ottawa the engine was taken to the foot of the locks and, while the engine was not working as well as it should, through an unfortunate mistake in the mixing of the gasoline and oil, it worked steadily and put water up 173 feet to the top of Parliament Hill. An engine of that kind that can be taken any place in the mountains, by man power if necessary, should be of great value in extinguishing fires which are guarded, and possibly may be of great use in direct fire fighting. The intention is to use a battery of engines. One engine would pump through 1,500 feet of hose to a readily portable canvas basin, and a second unit would pump from that on. We might require a good many units, because we are never sure of having water close to a fire. The installation is not expensive; were it so it would be useless to consider it. The engine cost $210, the hose $165, or a total cost of $375. By ordering in quantity we could, no dout, secure a considerable reduction in these prices.

Motor trucks are used for transporting the fire fighting engines and other equipment over the roads in the Dominion parks and have been giving great satisfaction. On the rear "Fire Auto" is printed prominently and the character of the country in which they successfully operate is shown in an accompanying illustration.

In continuing his address, Commissioner Harkin related the good work accomplished in removing inflammable material from the immediate vicinity of a railroad crossing, one park director saying: "We were fortunate in having a camp of interned aliens engaged on road construction there, and, as the road ran parallel and close to the railway, we had them do a considerable amount of clearing along the railway tracks outside the rights of way." The result was so satisfactory that the efforts of the aliens were utilized in other places.

A very detailed and widespread campaign of education was undertaken, and the active co-operation of private firms was secured, that rendered by the match companies being typical of all others. Mr. Harkin said: "It is admitted tht we are creatures of habit. Habit is at once our strength and our weakness, and we should therefore develop careful habits in regard to fires." He continued:

Educating the Public.

"With this object in view we started our educational work with match boxes . We figured that, in the final analysis, practically all fires originate from matches and, therefore, that a match box would be a good medium of education. We took the matter up with the match companies of Canada, and they all agreed to put the fire warning notice on their match boxes. They had to change their labels, and they did it entirely at their own expense, because they thought the cause a good one. On every match box put out in Canada, except perhaps a few safety match boxes, there is a fire warning notice. That means that nobody can take up a match box without seeing this notice, and we hope by the process of affirmation and reiteration to influence every man to some extent."

Because hunters are liable to cause fire the matter of preventing forest fires was taken up with the manufacturers of ammunition, with the result that now all boxes of shells contain a warning against carelessness with fires. One ammunition factory is pushing the plan with much energy and is supplying dealers of sporting goods with stickers, to be placed on all packages, appealing to the people to be careful of fires. The campers are another prolific source of forest fires, so that matter was taken up with the manufacturers of tents, and the result is that nearly all of the companies are inserting a warning inside the tent where the camper will see it the first thing in the morning and the last thing at night. A notice is also stitched to the outside of the tent. In an attempt to reach the woodmen, the axe manufacurers were appealed to, and at least one company is affixing a label to the handle of all the axes made that reads: "No work for the axeman if the forests are destroyed by fire. Save them by extinguishing camp fires, cigar and cigarette butts, and live ashes from pipes." As many people handle a telephone directory daily, fire prevention literature was printed in all the directories at the request of the commision. Placards were posted in the cabs of all engines operating through the parks appealing to the trainmen to be careful and avoid setting fires, as the destruction of forests means a lessening of tourist traffic and consequently loss of employment for railroad men. Fire notices were posted in the railroad coaches, and notices were printed on dining car menus, in the time tables and similar places. Notices were placed in all hotels in the parks, and an attractive card hung in each guest room, showing the danger of forest fires. This card was also freely distributed in stores, restaurants, etc. As most of the visitors to the park do some horseback riding or driving, metal fire notices were prepared and attached to the reins of all livery saddle ponies, in such a position that the rider could not grasp the reins without noticing it, and the other was attached to the dashboard and seats of all livery rigs. In addition to all this, many placards were posted by the government on all roads and trails in the parks.

One of the remarkable things about this campaign of education is that almost the entire expense was borne by the private companies. In speaking of this phase of the matter, Commissioner Harkin said: "So far as carrying on a campaign of education is concerned, our experience has been that the business men of Canada have sufficient interest in fire prevention and forest protection to co-operate at their own expense in carrying on a campaign of education."

Bombadier G. C. Fee, reported wounded and in hospital at Rouen, France, is the son of Mr. Thomas E. Fee, of Thomas E. Fee & Co., wholesale lumber dealers, Montreal.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

BASSWOOD AND PINE WANTED.—No. 2 Common and Mill Cull Basswood, 1 in. cull pine, Winter cut preferred. Apply M. Brennen & Sons, Hamilton, Ont. 16-21

Wanted to Buy

Maple Squares 18 inches to 48 inches long; 1 in., 1¼ in., 1½ in., 1¾ in., 2 in. and 2¼ in. squares.—Apply to A. K. Hansen & Company, Quebec. Que. 20-t.f.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Lumber Wanted

We are in the market for a quantity of Birch, Soft Elm, Hard Maple and Basswood, dry stock, for immediate shipment. Will be pleased to receive full particulars as to quantity, grade, and lowest prices. Apply, The London Lumber Co., Ltd., London, Ont. 18-21

For Sale-Lumber

Lumber Wanted

A list of what stock you wish to move placed in this column for a few issues will dispose of the lumber. Let us quote you on an ad. 20-23

For Sale

75,000 to 100,000 feet hickory. Will cut at once. Sell in log or dimension stock. What grades and sizes can you use? Located near Kalamazoo, Mich. Also some red and white oak. Address B. H. Honeywell, 721 N. U., Ann Arbor, Mich. 21-21

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

1 car 1 x 4 in. and wider, 37 in. long.
1 car 1 x 4 in. and wider, 31 in. long.
1 car 1 x 4 in. and wider, 22 and 25 in. long.

Dry Quartered White Oak, Clear 1 face 2 ends and 2 edges, 2 years old, nicely figured, Ohio stock. Write us for delivered prices.

PROBST LUMBER COMPANY,
18-21 Cincinnati, Ohio.

For Sale

We have the following stock for immediate delivery:—

50,000 ft. 3 x 6 Hardwood Hearts, mostly Maple.
25,000 ft. 4 x 4 Hardwood Hearts, mostly Maple.
200,000 ft. 1 in. Hardwood crating, principally Maple and Birch.
100,000 ft. 1 in. Birch, No. 2 Common and Better.

The Pedwell Hardwood Lumber Company,
18-t.f. Toronto, Ont.

For Sale-Machinery

Machinery Wanted

If you have any machinery for sale right here in this column is the place to advertise it. Every man who reads here is looking for a machine—if you have that machine you can do business. Let us quote you on an ad. 20-23

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

FOR SALE

We have the following second hand machines to offer, ask us about others not listed, if you are interested.

1 Egan 30 in. 2 drum sander.
1 McGregor Gourlay 30 in. 2 drum boss sander
1 Jackson Cochrane 36 in. 3 drum sander
1 Egan 42 in. 3 drum sander
1 Cowan 42 in. 3 drum sander
1 Cowan 48 in. 3 drum sander
1 C. M. C. 8 in. 4 side sticker
2 Ballantyne 12 in. 4 side stickers
1 Egan 36 in. single surfacer
1 Harper 26 in. single surfacer
1 Cowan No. 220 24 x 10 single surfacer
1 McGregor Gourlay QY 15 in. planer and matcher
1 McGregor Gourlay QY 9 in. planer and matcher
1 Jackson Cochrane 54 in. band resaw, 5 in. blade
1 Jackson Cochrane No. 165 rip saw

Wanted-Machinery

Secondhand Refuse Burner, 24 ft. diameter preferred. Give full particulars and price. The Knight Bros. Co., Ltd., Burks Falls, Ont. 21-t.f.

Burner Wanted

Wanted, Secondhand Standard Steel Burner, 20 to 25 ft. in diameter. Must be in good condition. Give full description with price, and state where same could be delivered in case of purchase.

FRASER LIMITED,
21-24 Fredericton, N. B.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

FIRST CLASS SAWMAKING FILER—Wants piece work contract. Shingle or Long lumber mill filing; will take Kendall gang or lath machines by thousand. Open for any proposition November 1st. Arrange now for next season. Apply Box 439, Canada Lumberman, Toronto, Ont. 21-21

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

FIRST CLASS MILLWRIGHT WANTED at once to install machinery in saw mill. The Turner Lumber & Pulpwood Company, Lake Edward, Que. 20-22

Business Chances

Billion feet, mostly Fir and Cedar, near Vancouver, 35 cents towage to free mill site. Will sell all or part and manufacture. Owner, E. Nichols, 1755 13th Ave. E., Vancouver, B.C. 21-21

For Sale—Controlling interest in a Saw and Planing Mill, capacity 25,000 feet. Could be increased considerably. Mill on rail and tide water. Unlimited timber supply. For particulars apply to R. H. Young, Squamish, B.C. 21-24

Timber Tract and Mill

Valuable Timber Tract, British Columbia; nearly 10,900 acres; 60,000,000 feet of timber; on railroad. Local market for mine props. First class mill, 30,000 feet daily capacity. Very attractive proposition. George W. Grant, P. O. 1676, Calgary, Alta. 18-21

For Sale

Saw-mill Plant at Twin Lakes, near New Liskeard, Ontario, fully equipped including tools, cooking and boarding house outfit.

Mill capacity 10,000 feet per day.

Price reasonable for quick sale.

Plenty of timber adjacent.

Apply TERRY & GORDON,
704 Confederation Life Bldg.,
Toronto, Ont.,
or
21-21 W. D. Watt, New Liskeard.

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, crosscut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.

Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

For Sale

Twenty acres Elm and Basswood, also 40 acres of Virgin Cedar near station. S. A. Price, 71 Lakeview Avenue, Toronto, Ont. 20-23

Miscellaneous

Blankets For Sale

Two Hundred Pairs Clean Blankets in good condition. The Peterborough Lumber Company, Limited, Peterborough, Ont. 20-21

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

For Sale

One hundred square miles of Pine and Spruce limits well situated on the St. Maurice River, on which at least 400,000,000 feet of lumber will be found. Price $350,000, payable $150,000 cash and the balance in four annual payments, with interest at 6 per cent. For full particulars apply to La Cie des Bois du Nord, 71a St. James Street, Montreal. 21-21

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of December next for the right to cut pulpwood and pine timber on a certain area situated on the Pic River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet, board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for twenty-five thousand dollars ($25,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $25,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Toronto, August 28th, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 18-22

Teams Wanted

We want to hire six or eight teams for winter haul, with or without teamsters. Work to commence about January 10th, 1917. Write Box 392, Huntsville, Ont. 22-23

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of February, 1917, for the right to cut pulpwood and pine timber on a certain area situated on the Black Sturgeon River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure, for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for ten thousand dollars ($10,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $10,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Toronto, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 21-22

Paper Mills to Use New Woods.

Washington, Oct. 30.—As the result of studies which have been made at the Forest Products Laboratory on methods of handling wood chips suitable for paper pulp, it is announced that Wisconsin paper companies are now negotiating with the railroads for shipment to their factories of experimental train loads of chips of Western woods adapted to paper making. Previous investigations by the Forest Service have demonstrated that good grades of paper can be made from a number of Western woods. The experts now estimate that some of these woods, when cut into chips and dried and baled, can be delivered to the mills in Wisconsin at a very small advance over the cost of chips made from local timber. If a favorable freight rate can be obtained, they say, the great quantity of pulpwood on the national forests should prove to be a considerable factor in supplying favorably located paper mills with the necessary raw material. In Wisconsin alone, it is stated, there is an annual market for over 300,000 cords of pulpwood.

The war has cut down the total shipping of all nations engaged in trans-Pacific trade from 380,000 gross tons to 280,000. Before the war American shipping comprised 21 per cent. of the total, British shipping 39 per cent., and Japanese 33 per cent. Up to the time the recent purchases were made American shipping had fallen off to 2 per cent., British tonnage had fallen off to 30 per cent., Japanese tonnage had increased to 55 p.c. of the total; Dutch shipping had jumped from practically nothing at all to 13 per cent. English tonnage fell from 150,000 gross tons to 84,000 tons, Japanese tonnage increased from 125,000 to 155,000 tons, and the Dutch increased from a negligible quantity to 35,000 tons.

Review of Current Trade Conditions

Ontario

During the past fortnight there has been a decided improvement in the lumber market situation throughout Ontario. About a month ago it was difficult to find any wholesaler or retailer who would say that trade was good. In fact everybody was talking about the volume of trade being very low and the demand practically dead in many lines. Today the situation seems to have changed in practically all lines. Undoubtedly the outlook for next winter's logging operations which will probably be smaller than ever before, and more costly, has had much to do with the improvement in trade. Re tailers have realized pretty generally that anything they buy next spring will cost them far more than what they have been paying previously, and that if they get into the market now and obtain such stocks as are available they are likely to come off much better than if they wait. In addition to the small output to be expected next winter, another factor is helping in the improvement that has lately developed. This is the recognized scarcity of many lines of stock. Last winter's production was none too heavy and the quantity of stock consumed during the past summer, both in Ontario and abroad has cleaned up many lines. One has only to recall the extensive export demand and activity locally in the furniture factories, box factories, etc., to account for the disappearance of the moderate stocks that have come from the mills during the past year. The indications are that we may look forward to at least as good trade during the coming year as during the past, and this being the case there is only one conclusion that seems reasonable, namely, that next year stocks will be both short and high in price. The improvement which has taken place in the market is therefore a logical one.

It is not possible to specify particular lines which are showing any special activity. So far as the building trade is concerned it continues on a very quiet basis, being practically non-existent in the large cities and only moderate in the small towns and country districts. As usual, during the past year, the chief consumption continues to be for the important wood consuming factories, especially those that are turning out shell boxes. There is no news to publish at present in regard to new shell box contracts, though many manufacturers are expecting something before long on account of the placing of contracts for various kinds of war supplies by Great Britain, in Canada, to the extent of some $60,000,000, which was recently reported.

Eastern Canada.

Reports of improved trade conditions are received from most points in Eastern Canada. During the past fortnight the trade at St. John has improved greatly, particularly in connection with purchasing ahead for British, French, and United States markets. The price of deals for next year's cut is about the same as for last year's, from $18 to $20 per thousand feet, according to the quality and specification. Scantlings and fourths are bringing about $2.50 per thousand feet less than merchantable. Enquiries from the United States are increasing. Prices are about $16.50 per thousand feet for scantlings and narrow planks. Lath are firm at $2.75 per thousand, and the demand is good. Stocks of shingles at St. John are practically nil, so far as the better grades are concerned. Prices are stiffening for the local trade.

At Montreal the lumber trade has also shown improvement during the past two weeks. There is a good demand for shell box lumber, and the general trade situation is also better. Trade during October has been better than during any previous month this year. Enquiries from the United States are increasing, and the volume of trade is greater. Exports to the United Kingdom are going forward steadily in fair quantities. Shipments of birch have been increasing, and are now of considerable extent. Ocean freight rates continue at from $275 to $300.

The spruce market at Boston continues firm and offerings are light. Random quotations are quite firm. The car shortage in eastern Canada is preventing Canadian spruce from entering the Boston market extensively. Current quotations are firm on the following basis:—2 x 3, $22.50 to $23; 2 x 4, $23.50 to $24; 2 x 5, 2 x6 and 2 x 7, $22 to $23; 2 x 8, $26 to $27; 2 x 10, $27.50 to $28; 2 x 12, $28.50 to $29. There is a fairly good demand for shingles at Boston and offerings are moderate. The best white cedar extras are held at $3.60 and clears at $3.30. Red cedars are firm and are bringing $3.85 for satisfactory makes of extras. Lath continue firm and offerings are becoming smaller. Some producers are now refusing anything under $4.50 for 1⅝ in. and $4 for plump 1½ in. There is not much trouble in disposing of anything in the way of good hardwood stocks at Boston, so long as prompt delivery can be guaranteed. Inch maple 1sts and 2nds has been selling at $45. Plain oak is in good demand and quartered oak is quiet. Birch is selling well. Current quotations on 1sts and 2nds 1 in. are:—Basswood $44 to $46, maple $42 to $45, plain oak $63 to $65, quartered oak $89 to $91, red birch $57 to $59, sap birch $47 to $49, white ash $56 to $60.

United States

The general trade activity of the United States continues, and practically the only thing preventing the trade from even greater expansion is the inability of the railway companies to supply sufficient transportation facilities. All reports agree that retail trade is extending, that buying for next spring is broadening to some extent, that prices continue high, labor continues scarce and the railroads are buying more freely in the steel market. Collections are reported to be good, and interior merchants are paying off old debts. Apparently therefore, United States manufacturers are in an excellent position to weather a storm of almost any kind. Manufacturers on the west coast report a decreased eastern rail trade, but that this has been offset in an increase in the cargo trade following upon more plentiful tonnage. Production of the west coast mills continues below normal. California sugar and white pine manufacturers report satisfactory demand. Southern pine manufacturers are suffering more severely from the car shortage than any other lumber manufacturers. Extensive curtailment of production has brought the output of southern pine down practically to a level with the demand, and manufacturers are able to obtain a better price than they have for a long time past. Prices in some cases have advanced materially and are on the average about $1.50 per thousand higher than they were a month ago. Business is offering freely at these prices, but only a small portion of it can be booked on account of the car shortage.

The demand for northern pine at Chicago continues strong. The yard and corporation trades are active and there is also a good demand for box lumber. The northern pine market at Buffalo is firm in all lines. Stocks are short in many grades.

Continued improvement is reported in the hardwood trade and it is also suffering greatly because of the car shortage. Furniture factories are busy and consuming large quantities of material. In fact all the wood consuming plants that use hardwoods extensively are being run at their capacities.

Great Britain

The advancing tendency in c.i.f. prices in Great Britain has been checked to some extent of late. The experience of c.i.f. buyers last spring was not a very pleasant one and they are holding back now as a result of what they learned at that time, and are watching the course of spot values very closely. Recently there have been a few runs on particular dimensions and prices have gone up rapidly, but the general level of prices has not been affected and reaction has set in as soon as the special orders have been completed. Very high prices have been paid for 3 x 11 in. deals and for all 4 in. stock. Freight rates from the Baltic have become more steady and prices of wood goods have shown a tendency to reach a fairly definite basis. The spruce market is still rather unsettled and shows a greater difference between spot and c.i.f. values than in the case of Baltic wood. Ar rivals of spruce at some of the west coast ports have been rather too heavy in view of the reduced consumption. This condition, however, is certain to be corrected with the end of the shipping season and the development of winter requirements. Some merchants are holding their stock more firmly. Business is rather slow, but the general tone is better and looks as though it will continue to improve. Quotations ex quay seem to be about £28 for 9 in., £26 for 6 in. and £24 to £25 for the smaller sizes. At Foy, Morgan and Company's recent auction sale 1 x 5 St. John spruce, dry, 1st, 2nd and 3rd brought £21 per standard.

Statistics show that stocks of spruce at Mersey points still make a pretty heavy showing in spite of curtailed imports. The consumption has fallen off recently and has brought about rather unsettled conditions for c.i.f. transactions. Importers in general are acting cautiously on account of the uncertainty of the future situation. Heavy f.o.b. contracts have recently been placed, most of the stock being for France, and it is hoped that this will practically clear the winter shipping ports of stock.

Glasgow importers report that the market for all kinds of pine is very dull, and that far too much stock is on hand for the very limited

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

requirements. Quotations for unsorted spruce, c.i.f. Belfast, were recently reported at £20 15s for 3 x 4 to 6 in. The demand for pine in Great Britain has not been very keen of late, but the volume of receipts from Eastern Canada will probably show up fairly well as compared with last year. Receipts of birch are more extensive of late, but are kept down to a considerable extent by the difficulty in obtaining Board of Trade permits to import. Practically all of the forward purchasing in Great Britain is now being done in connection with stocks required by the Government, both for Great Britain and France. Apparently the Government desires to handle nearly all of the supply and to be certain about such stocks as it purchases for future use.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade Much Improved

St. John, N.B., Oct. 24.—(Special to the Canada Lumberman.)—The last two weeks have shown a very material improvement in the purchasing ahead market for British, French, and American markets. Of course, the British and French trade is purely for war material, very little, if any, being bought by private account, the governments preferring to handle about all the supply and also to be sure of any stock they are buying ahead. How much they will want and the way they are able to transport it will have a vital effect on the market. At any moment they may stop purchasing, and this will cause a severe setback, as private individuals cannot purchase and pay the extreme freights that are being asked by steamships. Very little building is being done in England—in fact, any persons who attempt to build any work costing more than £500 must first obtain a permit from the government.

Prices for deals for next year's cut are about the same as last year—from $18 to $20 per M, according to the quality and specifications. Of course, the smaller the specification the lower the price, with scantlings and fourths about $2.50 per M less than merchantable.

The American market is firm, with many enquiries coming into the province. Prices are netting about $16.50 per M for scantlings and narrow planks.

Laths are stiff at $2.75 per M, with a good demand.

The shingle market at St. John is practically bare of all better grades. Of course, there are some Ex. No. 1 and second clears. The prices are stiffening for local trade.

The St. John River Log Driving Company have just completed rafting operations, having rafted 54,000,000 feet during the past season. This is some 3,000,000 feet less than rafted in 1915. It is made up as follows About 48,000,000 feet of spruce, 4,000,000 feet of pine, and 2,000,000 feet of cedar. Practically no logs are left in the River St. John, from the source to the mouth, which is unusual. A few are at Grand Falls, but this is usual, as they go in to the falls in the spring and remain there until the following spring.

At the present moment it is almost impossible to forecast the log cut for 1916. With the scarcity of help and the high price of food both for man and beast, it will surely cost more to log this winter, but all localities will not be affected to the same extent. Places where there is a large population of farmers and lumbermen, with good crops of oats, etc., will not be as hard hit as those in other sections.

Better Trade at Montreal

Montreal, Oct. 24.—(Special to the Canada Lumberman.)—Conditions in the lumber trade have considerably improved of late. This is due mainly to the demand for shell box lumber, but the situation is also better as regards the general trade. One wholesaler stated that October promised to be the best month this year, and another declared that business was quite brisk. There are still complaints of difficulty in obtaining certain lines from the manufacturers, who are hard hit by the decrease in the labor supply.

Pulpwood prices are hardening, and supplies are also limited.

Enquiries from the United States have increased, with a larger volume of business passing.

The Imperial Munitions Board have called for tenders for further quantities of boxes. The board have also placed an order here for cartridge boxes.

Exports to the United Kingdom are still going forward in fair quantities. The amount of space in liners is restricted, owing to the heavy consignments of produce, but this lack of room is in a measure made up by two more tramps which have been loading spruce here. The call for pine has not been very keen, although the volume of this lumber this season will probably be found satisfactory, considering all the conditions. A considerable amount of birch is being shipped, and more would go but for the difficulty of securing British Board of Trade permits. Freight rates are about the same, 275s to 300s being quoted.

The sulphite market continues buoyant. Stocks on hand are small and the demand is as good as ever. Several projects for adding to production are being carried out, and the new year will see a much heavier tonnage available. Several English paper makers made a strong protest against the limited amount of pulp admitted to the country as compared with the imports of paper, with the result that the Government have raised the quantity of pulp to be imported. Canada continues to send substantial amounts to the other side. Ground wood is very firm, and in strong request. Although the manufacture of newsprint by the principal mills on the Continent has increased about 500 tons per day, the purchases are so numerous that stocks have materially decreased, and on the 1st of October these stocks were lower than at any previous date in the history of the industry. The figures show a falling off, month by month, since the beginning of the year, consumption being in excess of the output.

Glasgow Report on Lumber Trade

Calder, Henderson & Livingston, Glasgow, in their quarterly timber market report, under date of October 1st, say:—While a steady consumption of wood goods for war purposes was maintained, the general enquiry was very quiet and trading conditions throughout the quarter were of about the worst possible description. A serious fall in prices of the leading items of the passing consumption, viz.:—Spruce deals and North of Europe white pine, was occasioned by a substantial drop in freight rates and values of almost all other woods were also affected. The change to lower figures brought no expansion in the volume of business, but only served to scare buyers, who refused to operate except for absolute pressing wants or at throw-away prices.

Arrivals of spruce and pine deals were much in excess of requirements, especially the former, and a restriction of imports would help to steady values. Other arrivals on the whole were moderate, and in the case of prohibited woods decreased quantities came forward. Stocks of spruce and pine deals are too heavy. Log timber in the aggregate is moderate but ample for present requirements, and American hardwoods are lightly stocked.

Shipbuilding orders did not come away to the extent expected. Packing-case makers were busily engaged, but report fresh orders as scarce. Other wood consuming industries were fully employed excepting cabinet-making, which was very quiet, and housebuilding, which, apart from erections for munition workers, remained in a state of stagnation.

Yellow Pine—Waney.—Arrivals were light. No improvement in the enquiry for first class deckwood was in evidence, as the expected early return of the shipbuilders to mercantile work did not develop. All other sizes and qualities were also neglected. The consumption for the quarter was extremely poor. Values, in the entire absence of demand, were not tested and were nominally on a high level, but are now weaker on the basis of the lower freight rates current. The stock shows a reduction compared with that of last year at this period, and is more than ample under present conditions.

Oak.—The import was about an average one and came to a very bare market. It consisted mostly of first class wood suitable for railway work, etc. Unfortunately the high figures required scared buyers, and as far as possible they filled their requirements from the cheaper United States logs and also native timber. The consumption suffered and was about the lowest on record for any quarter. Stocks are heavier than those of last year. Values are high.

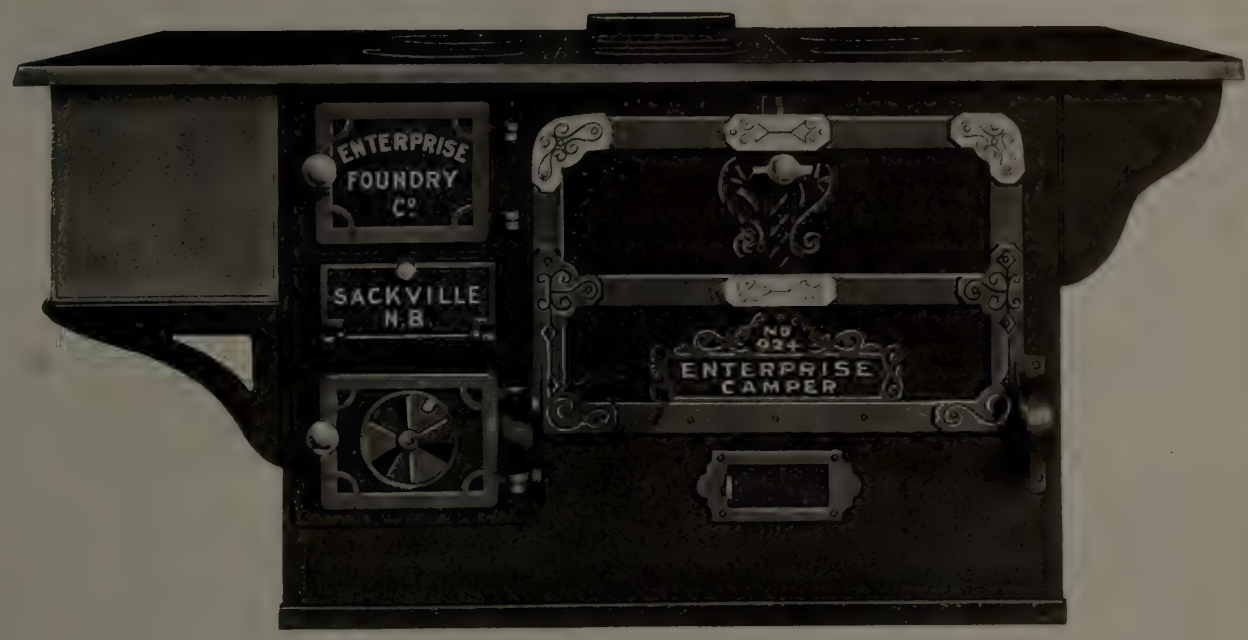
Elm.—A limited enquiry was experienced for first class logs of good sizes and resulted in a very moderate consumption. High prices ruled and the stock, though to the heavy side, is firmly held for all qualities and sizes.

Birch—Logs.—The import was moderate and arrived on a market bare of stock, but the extreme prices required practically put a stop to purchasing and caused the using of cheaper substitutes, such as native elm, beech, etc. Values weakened but are still considered too high by buyers. Stocks are ample. Planks.—A moderate quantity, partly on contract, arrived and was on the whole well taken up. Prices were high and kept steady and retain their firmness.

Deals, battens and boards—Pine.—Arrivals of all descriptions and sizes were largely in excess of the enquiries, so that stocks all round

Buy a Good Camp Range

The Enterprise Camper Steel Range is the result of experience on the part of Lumber Camp men and expert stove makers. Combining their knowledge of what a range should do and how it should be made, the Enterprise is the most satisfactory Camper range on the market today.



Made in Two Sizes

Burns coal or wood. Fire box takes stick of wood up to 32 inches long. Oven extra large and fitted with strong, well braced door, opening level with oven bottom.

Will cook for 60 to 100 men without any crowding or inconvenience. Made of highest quality Bessemer steel and fitted with exceptionally heavy castings.

No. 9-24—Top measurements with reservoir and shelf 61 in. x 33 in. Oven 24 in. wide x 25 in. deep and 15 in. high.

No. 10-30—Top measurement with reservoir, without shelf 62 in. x 33 in. Oven 30 in. wide x 25 in. deep and 15 in. high.

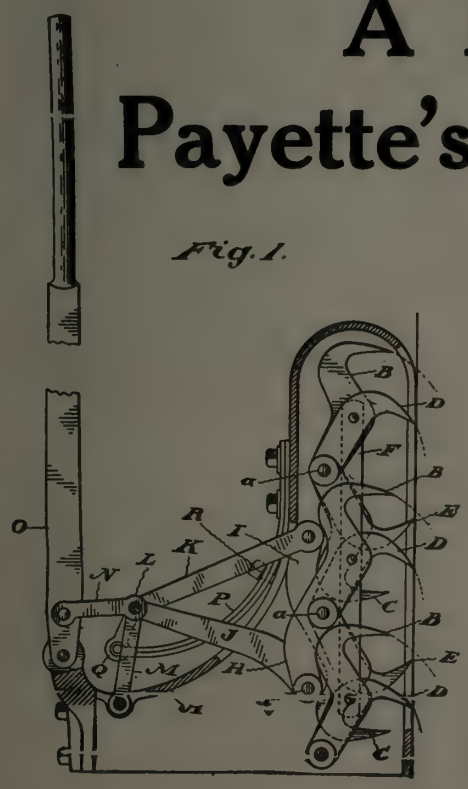
We can supply detachable copper reservoir and large waterfront when required.

Write for our illustrated circular and prices to lumbermen.

Enterprise Foundry Co., - Sackville, N.B.

A Boon to Lumbermen
Payette's Famous Patent Mill Dogs
650 Sets already sold

Fig. 1.



BECAUSE

(1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves, Five different classes and styles of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

P. Payette & Company

Engineers and Machinists

Penetanguishene, Ontario

are too heavy. Values, affected by the absence of demand and the fall in freight rates all over weakened, but are now somewhat steadier.

First quality.—For broad deals 12 inch and up by 3 inch only occasional enquiries were received, and transactions were difficult to carry through owing to the high figures wanted and also the competition with the cheaper Siberian wood. Regulars and undersizes were not wanted.

Seconds.—For all sizes there was no demand, the import and stock remaining practically untouched.

Thirds and Fourths.—Experienced a very moderate enquiry, chiefly for the regular sizes 11 inch by 3 inch.

Red pine.—Was seldom enquired for and could only be moved at a low figure. Stocks are ample, especially in view of the limitations of building construction, except for munition purposes.

Spruce arrivals were too heavy and the demand very disappointing. Buyers in the face of the falling market purchased lightly and only for immediate requirements and consequently stocks show a large increase. The competition of cheap Swedish deals and box shooks was keenly felt. Under pressure to sell values showed a substatntial reduction, but are now considered to have about touched bottom, and the tendency is towards steadier prices. Stocks are ample and a lessened import would help to regulate values. The demand at present is not strong.

Spruce Stocks Heavy on Glasgow Market

Cant & Kemp's, Glasgow, in their timber market report, under date of October 2nd, write as follows:—There is little change to report in the position which developed in the latter part of the previous quarter. Buyers are showing no desire to make extensive purchases and seem quite content with the "hand to mouth" system of buying which has been a feature for some months, while the fall in freights was no doubt the primary cause of this policy, other factors have influenced its continuance. The considerable imports of spruce, for instance, coupled with the fear of a much lower rate of consumption, have given buyers the impression that they will be able to get their needs supplied whenever necessary without much difficulty. The recent rises in the freight from Sweden, which had reached a low level, compared with earlier in the season, will probably have a firming influence on spruce. Yellow pine deals have met with a poor demand and there is ample stock unless there is some unforseen development.

The full effect of the prohibition of various hardwoods and fancy woods is now apparent and no further lots are likely to get forward. In spite of this fact, the demand is very trifling, and there are still some parcels in first hands for sale.

Shipbuilders are still mainly employed on government work. There has been a little more enquiry from this source, but until they can get ahead with merchant work there can be no great volume of business.

Quebec waney and square pine.—The stock is lower than usual but appears ample for the demand.

Quebec red pine.—The stock of timber is "nil." The stock of deals is sufficient for the small demand.

Quebec oak.—The stock is considerably increased and meeting with a fairly ready sale at good prices.

Quebec elm.—The stock is lower, and prices keep firm, though the demand is not very active.

Ash.—The stock is not heavy but quite ample for the demand, owing to the competition of home ash. Quotations are—5s 6d to 7s for first class parcels of logs and from 4s 6d to 6s per cubic foot for planks and boards, according to quality and specification.

Birch.—The stock is increased but the demand is very disappointing. Quotations are—4s 6d to 5s 6d. Planks 3s 6d to 4s per cubic foot.

Quebec yellow pine deals, etc.—The stock is much heavier, and the demand is restricted. Quotations are—Firsts—Broads, 6s 7d to 7s. Regulars, 6s to 6s 3d. Undersized, 4s 9d to 5s. Seconds—Broads and Regulars, 5s to 5s 6d. Undersized, 4s to 4s 3d. Thirds—Broads and Regulars, 4s to 4s 4d. Undersized, 3s 7d to 3s 9d. Fourths—Broads and Regulars, 3s 9d to 4s. Undersized, 3s 5d to 3s 6d. Good Sidings, 5s 6d to 6s 6d,—all per cubic foot, according to specification.

Quebec spruce deals.—The stock has greatly increased and prices have fallen. Quotations are—9 inches and up, 3s 6d to 3s 9d.; 8 inches and under, 3s to 3s 3d per cubic foot.

Lower port pine and spruce deals.—The stock is considerable. Quotations are:—9 inches and up, 3s 4d to 3s 7d, 8 inches and under, 2s 11d to 3s 1d per cubic foot.

New Brunswick North Shore Operations Increasing

Lumbermen on the North Shore of New Brunswick are preparing for a larger cut of logs on Miramichi waters this winter than last winter, according to a report by J. M. Scott, of Fraser Limited, Fredericton, N.B., who recently visited a number of the manufacturers. Last winter the cut on Miramichi waters was 68,200,000 superficial feet. This winter's cut is sure to be much larger, and at the present the estimate is that it will be over 90,000,000 feet. Fraser Limited, will cut 12,000,000 feet on the Clearwater for the mill at Nelson, N.B., and about the same quantity for the Victoria mill at Fredericton. Lumbermen on the St. John River are not yet certain about the extent of their operations during the coming winter as they have to face a serious problem in connection with the shortage of labor. It is considered likely that a large number of French Canadians will be taken to New Brunswick for woods operations this winter.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending September 30th, 1916, is furnished by H. W. Lightburne and Company, Liverpool, and their St. John, N.B., representative, John E. Moore and Company, Limited:

Barbados Market Report

S. P. Musson, Son & Company, Bridgetown, Barbados, report under recent date as follows:—Lumberstuffs—White pine—No arrivals have taken place during the fortnight, and as there is a good enquiry we would recommend later shipments which should sell well. Spruce—The Schr. "Ainslie" from Gaspe has brought a small lot of 30,000 feet which have been sold at £31 duty paid. Supplies are wanted. Shingles—The Schr. "Ainslie" has brought 847,000, of which 640,000 are cedar laying, and these have been sold at $2.50 duty paid for Extra No. 1's, and $2.10 for No. 1's. The remainder of 207,000 are Long Gaspe, and these brought $6.00 duty paid. Shingles of both descriptions are wanted for later shipment. Wood hoops—No receipts. Shooks—The S.S. "Cratheus" from Mobile has brought a small lot of 521 bdls. shooks.

Important Improvements at Port of St. John

The Canadian Pacific Railway Company is laying plans for another record season at St. John, New Brunswick, during the approaching winter. It will be remembered that all records for the port were broken last year by an export valuation of 24,000,000 sterling, as against £8,600,000 in the previous year. The Canadian Pacific Railway's programme of improvement, which has already been entered upon, calls for additional trackage space sufficient for 350 cars in their west-side freight yard. This will bring the total yard accommodation up to 1,850 cars. All light rails now in the yard will be replaced by heavier metals; a new coaling plant will be erected, a 20,000,000-gallon fresh water tank installed, and the capacity of the sidings between St. John and Montreal increased. Other concerns are likewise providing for increased demands on their freight and passenger handling capacity.

J. D. Buckley, Newcastle, N.B., has exported 25 vessel loads of lumber and timber during the present year. The last vessel shipped out carried 3,800,000 feet. Mr. Buckley has sent 200 men into the woods for the coming winter's operations. This is twice as many men as he employed in the woods last year.

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company,** of Easton, Md., after giving the "Morehead" system a thorough trial.
Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature—**
—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.
Save **fuel** by bringing the pure condensation directly back to the boilers HOT!
Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.
Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

Canadian Morehead Mfg. Company
WOODSTOCK, ONTARIO

Great Britain Demands More Canadian Wood Pulp

Don't miss this opportunity to increase your profits. Make Wood Pulp. Install a small Soda Pulp Plant to take care of the Slats, Tops, Bottoms, and waste wood around the mill. You can have a long term contract to dispose of all you make, if you desire. We have imported ninety per cent. of all the Canadian Wood Pulp supplied to Europe since 1899. This is a pure profit to you. The cost of the plant is small and the material would otherwise be destroyed.

Write us for details.

Co-operation of Employer and Men

Logging Results Improved by Good Treatment of Men and Mutual Esteem Between them and the Employers

By D. S. Painter, McCloud River Lumber Co.*

There can be no doubt at all in the minds of any who have the control or handling of labor that to obtain efficient results there must be co-operation, at least, between yourselves, the company you represent and the men in your employ. There is great need for the employer and employe to work together, and the present time is particularly appropriate for co-operative effort.

Years ago, when practically everything was done by human hands, labor was plentiful—there was little or no competition—the employer had not personal interest in the welfare of the employe—paid them almost nothing, and the output per man was in proportion to his pay. The education of the masses has changed all this. They are to-day a higher type of man than they were then, and, being such, demand more consideration.

In this day of keen competition and modern improvements in all kinds of machinery the operator must get all he can from the labor he employs. The question is, "How to get the best results, and how his labor must be handled to get these results." The answer is, "Welfare work." Within the meaning of these two words wonders can be accomplished. The constantly increasing disposition on the part of the employer to regard the interest of his employes with the degree of concern that attaches to his own affairs is hopeful. It is not so long ago that the employer believed he had no interest in the person of his employe beyond the door of his mills and factories. He knows now that he owes something more than the opportunity of giving a man a mere job. He knows that if the greatest economy in production is to be secured, the people who make up his organization must live in an environment and under circumstances conducive to highest efficiency.

Camp Improvement Noticeable.

A beginning has been made in practically all of the logging camps and industrial towns already. Compare the vermin-infested bunkhouses and the fly-breeding camps of a few years ago with the sanitary surroundings in which the loggers and mill employes live to-day. This change has been made voluntarily in some instances by the employers, but with others it was necessary to pass laws governing sanitation in camps. Give a man a good place to sleep, good, wholesome food to eat, pleasant surroundings for his hours of rest and recreation and his whole being is more in accord with the management that makes such things possible. A manager who is located a distance from his operation does not come in contact, and therefore does not know his men. His demand is generally "maximum economy and output," which means low wages and as much work as possible. Most all labor troubles have been caused by a mutual misunderstanding. The industrial woods are full of schemes these days to bring together in the spirit of better understanding the employer and employe. Some of these efforts have succeeded admirably, while many have failed. The motive, however, has been in the main honest, and, as a consequence, encouraging headway has been made. What we want are the methods by which a better understanding, which results in more co-operation, can be obtained. One of the best indications of finding the right path through the thicket of industrial misunderstanding is the disposition on the part of both to listen to each other.

The best way I know of to get the employe to listen is by forming a plant organization, which should meet at least once a month—every two weeks if possible. Let the employer be represented by the manager and department heads, a programme of topics arranged that are of interest to the employe—work being done, methods of doing it, comparisons with methods used elsewhere, etc. Each meeting a single topic is taken up, a paper on this is read by an employe and afterward thoroughly discussed by those present. You would be surprised at some of the able papers presented at such meetings.

We tried this at McCloud, and it certainly did a great deal to improve the feeling between the men and the management. At these meetings, after the programme has been finished, anyone present who has any suggestions or criticisms to make regarding anything around the plant, whether for the benefit of the company, his neighbor or himself, is requested to make these suggestions, and he knows that anything he may say, if he is sincere in his statements, will not be held against him. A frank, outspoken man is a good deal more valuable to you than a "behind your back" grumbler.

Publishing a House Organ.

There was a time when a close relationship used to exist between the logger and his employes—when the operations were of small magnitude. Then the employe went directly to his employer with his grievance or his suggestion, and they talked it over, face to face. Now, however, conditions have naturally changed. Some substitute for the old relationship must therefore be instituted in order to supply a safety valve for individual grievances. The method spoken of above I believe to be an excellent one. One of the best guarantees against misunderstanding is publicity. This can be obtained by publishing a house organ in connection with the organization spoken of above. The publishing of a periodical, say, monthly can be made to show not only the correct intention of the employer and employes, but it can be used as a sort of forum through which an exchange of ideas and methods may be discussed. Of course, the direct value of a house organ will depend largely upon the prevailing conditions in the organization using it and the man or men you may put in charge of editing it.

Another idea along these lines has been the installation of suggestion boxes, placed in the commissaries of logging camps and mills and factories of industrial towns. Employes are advised that any suggestion they may have to make or any ideas that might be worked out can be written up and dropped in the box and they will be given due consideration. A committee consisting of camp foreman and two employes, who should be well liked and leaders, is appointed to make periodical collections from these boxes. This establishes a regular means of communication between the working organization and the management. A financial recognition of suggestions or ideas adopted goes a long way toward keeping the interest in this work up.

The establishment of the Y.M.C.A. cars in the camps of the Northwest, from what I can find out, has been a good thing, not only for the employer, but the employe, who is beginning to appreciate that something is being done for him. The scoffers are getting less and less every day. They will soon be eliminated. New ideas and methods will be adopted from time to time, all leading toward the goal of perfection in social and industrial development which can come about only through co-operative effort.

Bonus System An Incentive.

The adoption of the bonus system in logging is receiving more recognition every year. This is another step in co-operation.

The reward of success is large to both sides. To the employe it comes directly in increased earnings. To the employer it comes almost equally directly; for if under the stimulus of wages proportionate to effort the men increase their efficiency the output of the camp is increased without any cost for additional engines or skidders, enlargement of the camp, extension of or additional logging spurs or of any increase of any fixed expense. The cost of production is lowered and the profit per thousand in logs is correspondingly increased. It is a stimulant to individual effort by the incentive of individual reward—without breaking down the men's safeguard of a recognized standard wage rate.

Fundamentally there are but two ways of paying men for their services: One is day wages, where a man is paid according to the time he spends, regardless of the quantity of work done in that time; the other, piece rate, where he is paid according to the quantity of his output, regardless of the time spent. The advanced wage systems in logging operations are combinations of these two principles. Payment of bonus should be for a month's run and not on one day's output, for if paid according to the latter method the entire crew could work hard and efficiently for one day, bring their earnings for that one day far above the average daily earning, then be lax in their efforts the balance of the week. The result would be less output in logs per man for the week, but payment of wages would be more than an average daily wage, so such bonus systems should be paid in the general average on logs for a month's work, or logs brought in on one donkey or skidder setting. Falling and bucking by piece work is also another step along these lines—a system whereby the worker is paid proportionate to his efforts.

Simple Accounting System.

The employer knows just exactly what each operation of his logging is costing him. This brings us now to the method of keeping these costs and the results to be expected of cost accounting. Which is the more important—to know what you have paid out or to receive what you have paid for? Both are of equal importance to the manager and logging superintendent. To know these things you must have a reliable, adequate, and permanent form or system on which these costs are figured. To form any comparison between your operation and ours, your forms, cost sheets, and fundamental records must be made and figured on the same basis—in other words, standardized. We will all admit that in each operation, whether fir, pine, or redwood, the basic principles of getting logs to the mills are the same, but conditions in each operation are vastly different. A primary obstacle in the way of a uniform cost keeping system for all timber operations is in the great diversity of conditions under which the timber is purchased, handled, and transported to the mills. The operation itself, whether by ground or overhead skidders, donkey engines, big wheels, or the latest electrical machines; whether the timber was purchased twenty years ago or bought yesterday, your cutover lands of a problematical value left on hand after your operation, all present phases extremely difficult to adjust to the niceties required by the modern apostles of cost keeping. Nevertheless a standardization of cost keeping of logging operations should be decided upon and adopted.

The Southern Pine Association, consisting of a combination of 74,

* Address delivered before Pacific Logging Congress.

"LIDGERWOOD" PORTABLE HIGH SPAR SKIDDERS

OPERATING OVER

LONGEST SINGLE SPAN

IN THE WORLD

Skidding Logs over 3800 feet

"Lidgerwood" Cableway Skidders have two exclusive and patented features and these are essential to the success of this style of lumbering.

1.—"Lidgerwood" Cableway Skidders have a mechanical slack puller. The buggy is held stationary while the mechanical slack puller pays out all slack required in the skidding line to reach logs lying at a distance each side of skidder.

2.—"Lidgerwood" Cableway Skidders have a two speed device on the engine which returns the buggy to the woods at high speed.

We have paid special attention to the construction of Cableway Skidders required by conditions in British Columbia and the most successful machines now in use in that province were installed by us.

Head Office:—**TORONTO.** District Sales Offices:—**Montreal, Halifax, Ottawa, Cobalt, Porcupine, Winnipeg, Calgary, Edmonton, Nelson, Vancouver, Victoria**

have standardized their cost accounting, and issue a statement to their members each month, showing what the cost of operation has been for that particular month and for the season to-date. Each mill or logging operation on the published cost sheet is designated by a number, without the name being given. Each operating member can then see at a glance how his cost compares with others, and in this way watch closely for any particular part of his operation that may be high in proportion to the others. This all works toward the betterment of those concerned, and is co-operation between yourselves, which is just as important to the industry as that between you and your employes. Taking it all in all, an industry's prosperity depends on the big word co-operation and the little word individual, mixed with a lot of well-directed energy, making a composite effort which spells success.

The Care of Saws

The proper care of cut-off saws is an item in every up-to-date mill where trimmers and gang slashers are used. Much has been written about broken cut-off saws, and highly intelligent information given. A sufficient amount of set should be given cut-off saws. They should be filed or ground square in front, with pitch line to centre, with the back beveled. This makes the best tooth for a cut-off saw, swing or stationary. Each tooth is a cutter and a raker. Experts tell us that large cut-off saws should be left with a little slack on the rim, sufficient not a wave in motion. Again, cut-off saws should be at least one gauge heavier than the standards. Keep the saws sharp. The average reader will be surprised to make power tests of same machine and same kind of stock cut with a dull and sharp saw. Short cracks can be centre punched on each side, which will arrest them. Cracks over three inches long should be drilled.

There are two extreme conditions under which lumber may be resawed to get best results. One when it is green and fresh, and the other when it is thoroughly dry. To resaw it anywhere between, with it partly dry, means excessive warping and checking. It naturally follows therefore that whatever kiln drying is to be done should be done in advance of resawing. This drying out offers an opportunity also for straightening warped and crooked boards. One can resaw boards with curves and crooks in them and get along very well, but if they are warped and cupped, the best thing to do is to make some effort to flatten them out before resawing.

A band saw is as treacherous a thing, when you approach a point nearing its capacity, as anything one can imagine. It may be working fine at 60 feet feed, and push it up to 70 feet and it will begin to make trouble. The result is usually an inferior quality of work, much more than offsetting the gain in quantity. The saw cannot be rushed beyond what it is put up for, to do good work. Neither can the saw be underfed and good results obtained. Either will soon get the best fitted saws to working badly.

To fit up saws to stand the highest test of efficiency, you must carry all the weight consistent with good practice, as well as tension to the highest degree that the plate is capable of withstanding without danger of cracking. In the case of a saw wearing narrower, you can decrease the weight, but do not decrease the efficiency of the saw. On the other hand, with a still wider saw and conditions the same, carrying the maximum tension the saw will stand, if you undertake to increase the weight because wider saws are recommended to carry heavier weights, you are subjecting your saws to fracture from heavy strain.

As to the brazing of band saws. Be sure you cut the blade to a line squared across from tooth edge, as the back being crowned or convex would not do for squaring the ends. After the saw is cut, see that both ends, when laid down on the leveling block, lie flat. This is very essential in making a good braze, as if one corner should not fit down closely you couldn't possibly grind the lap evenly all the way across, which is necessary in making good brazes. After the ends are flattened down properly, joint them until the full thickness is square, or until edges are sharp. Be careful to get all the cold-chisel marks out if you use one to cut the saw, and be sure to keep the ends square.

Always leave the ends of laps the thickness of 26 or 28 gauge. By so doing, when your laps are clamped together, the pressure is all concentrated on the part where it is needed; and the irons don't mark or compress the plate on each side of the lap, leaving an unsightly scar, which won't file out in finishing without making the plate too thin at the point, which would weaken the braze.

After the two ends of the saw have been brazed together the spot will be found to be soft. If the saw is left in this condition it will likely bend and kink at the braze, entailing considerable trouble to put right again. The saw should be taken out of the clamps as soon as the brazing irons lose their color and become black, and the saw should then be allowed to cool rapidly in the air. If this is done at the right moment the saw at the braze will be much harder than if left in the clam until cold.

As frequently happens, the operator is not particularly interested in the machine, its adjustment, care or output. He has merely to put the stock through. In this case, the saw may or may not do good work. Most likely not; and if the filer does not take an interest in it, and the saws do not work right, it immediately reflects back on him.

Every filer should make it his business to see that guides are in proper adjustment. But don't stop at the saw guides; go over the entire machine. Look at the guide support. See if it slides properly on the guide column. Indeed, it pays to look ahead as well as behind.

It has always been an established fact in the minds of practical operators that accurate knife-setting was impossible and now that joining them while in motion has added much to approach the degree of accuracy, they overlook the importance of getting each as near as possible within the cutting circle before they do their jointing.

Too much jointing does not tend to improve the quality of machine work. On the contrary it leaves a heavy heel on the knives and lessens their cutting qualities.

Again, careless setting causes many ills that jointing or grinding cannot overcome. You cannot expect that because you have more knives cutting, it isn't essential to set each one accurately and think that the balance will do the work. It's a bad habit to get into, and it will never get one anything to overlook this feature of practice. Hardwood Record.

France Wants Canadian Wood Pulp

Mr. Philippe Roy, General Commissioner for Canada in Paris, has forwarded the subjoined translation of a report prepared by the Societe des Papeteries Berge at Lancey, whose mills were visited by the members of the Canadian Trade Commission, during their recent tour of inspection in France. It has been requested by the Commerce of Grenoble that the contents of this report should be brought to the attention of pulp manufacturers in Canada:—

The French industry of paper manufacture depends upon foreign countries for its supply of chemical and mechanical pulp.

Its requirements are supplied by the countries producing wood-pulp, Sweden, Norway, Austria-Hungary and Germany.

The imports amounted during the year 1913 to:—

Mechanical pulp	tons	260,000
Chemical pulp	tons	205,000

Valued, according to 1913, as follows:—

Mechanical pulp	Frs.	35,000,000
Chemical pulp	Frs.	60,000,000

Germany and Austria only appear for 26,000 tons of mechanical pulp, but the imports of chemical pulp from these two countries amount to 66,000 tons, of a value of about Frs. 20,000,000.

The increase in imports of German chemical pulp was particularly rapid, indeed from 18,000 tons in 1894, it reaches 66,000 tons in 1913.

The German and Austrian forests cannot now supply in full the pulp mills of these two countries which make up a good part of their needs with lumber from Finland.

Finland, which already has a few chemical pulp mills, can extensively develop this industry.

Canada owns inexhaustible forest resources. She can, like Finland, considerably develop the manufacture of mechanical and chemical pulp.

These two countries can assure all the requirements of the allied countries importing wood-pulp, if they find themselves protected against the competition of the central empires.

We recall below the means which we have indicated to the Canadian Trade Commission as likely, in our opinion, to favor the development of the production of wood pulp in Finland and Canada, as well as in the allied countries.

1.—Enactment of export duties in Finland and Canada on lumber intended for the central empires.

2.—Enactment, in allied countries importing pulp, of special custom duties against pulp coming from the central empires.

We deem it advisable to add that during the first year which will follow the end of hostilities, owing to the high rates of freight, in order to offer an effective protection to the Finnish and Canadian industry against German mills, it seems imperative to establish ad valorem duties. The principle of specific duties could nevertheless be preserved and these specific duties re-established when the position of the world market will have become normal again.

During the last two weeks in October the shipments of lumber to foreign ports from Portland, Oregon and other lower Columbia River points amounted to more than ten million feet, which is said to be the most extensive off-shore lumber trade recorded at Portland in many months. Shipments included 3,500,000 feet to the United Kingdom, 2,500,000 feet to Balboa and 4,000,000 feet to Hawaii and Australia.

The Importance of Wholesome Food

Lumbermen especially need the very best of nourishment all the time. Don't neglect this for a minute. Flour plays a very big part in the diet of every camp, and to get the best possible results always choose wisely from the brand you **know** is reliable and uniformly nourishing and good. Do you know that almost all the large lumber camps in this country stock

Cream of the West Flour

The Hard Wheat Flour that is guaranteed for Bread

Not from price influences or hearsay. These experienced men have tried out our product, and keep to the same brand because it has passed their test and serves their purpose best.

Our horse feed is distinctly good. Bullrush Crushed Oats (best grade Western oats) and Geneva Feed (crushed oats and cracked corn) are both worthy of attention for your stable.

Write us for special prices on shipments of Flour and Feed.

B. C. Industry Enjoying Improved Demand

W. A. Anstie, general manager of the Forest Mills of British Columbia Limited, Revelstoke, B.C., recently visited Vancouver on business. He reports that for some months past the demand for lumber has been exceeding the supply and that the mountain mills are working to capacity in order to fill prairie orders. When the mountain mills shut down for the winter he expects that the coast mills will find a continuous demand for lumber from the prairies and that, as a result, the price of lumber is likely to be well maintained. Mr. Anstie expects the lumber industry in British Columbia to experience a revival in the spring of 1917, and a year hence that it will be in a more flourishing condition than for some years past.

Knock Down Portable House for War Areas

According to a report in the Timber Trades Journal, of London, Eng., Mr. Alphonse Gravel, of New Orleans, who has spent his business life in the lumber trade, has designed a wooden house in knock-down form for the devastated war areas, to be erected immediately on the cessation of hostilities and used until such time as new houses of bricks and mortar can be constructed. Mr. Gravel's house is composed of sections that are all interchangeable, so that there is no necessity for marks to distinguish them, and the sections of one house will fit in all the others. The frame is so designed that only two standard unit sizes of each part, and the two standard insertions will produce any size frame required. The floor and ceiling sections are of three standard dimensions, and will fit a room of any given size. The wall sections are so constructed that when put in place they form with the posts that separate them from each other a dovetailed joint which is securely clamped with bolts and is impervious to the weather, and makes the building stronger than one built in the usual manner. The frame is put together with suitable casting and bolts, which are already fitted before shipment and can be quickly assembled together by any intelligent man with the help of one or two laborers. The building contains no parts which are too heavy to be readily handled by two men. Mr. Gravel was at one time a manager of a large woodworking establishment near Quebec, P.Q.

Music and Movies for Camp Employees

Keeping the employees of a logging camp contented is a big proposition nowadays, but it has been solved by at least one large western company in a simple enough manner. "It will not be necessary for the woodsmen employed by our company to go to the city to see the latest wrinkle in movie theatre attractions, because we are to build a movie house for the men," said the president and manager of this company. "We have decided upon the new diversion in the life of our employees because we feel that they are entitled to amusement and are entitled to the very best. We purpose supplying nothing but the very best class of films and constant renewals of programme. But that is not the only innovation we are introducing among our workers. In each lumber camp, some far from the railroads, you will find the very best of phonographs the company could buy. The company also keeps the phonograph supplied with records. Our boys in the heart of the forest can hear the very best bands, the best orchestras, the best singers, the cleverest chatter of the ablest comedians every evening after they are through with work. We have erected a hotel for our employees. Every man has a room to himself, a bed to himself, and every room is lighted with electricity. The food is first class. We supply this hotel accommodation for about ninety cents a day. We have not a man on our payroll, laborers I mean, who is receiving less than $2.50 per day, and most of them are getting $3 and $3.50. I decided some years ago that if employees are to be made content they must have good surroundings. That is why a large number of our men that we brought from the east when we first opened up are still with us. There has been some talk of threatened labor trouble among the timber workers, in which I do not take much stock, and I will venture right now that there will be no labor trouble in the ranks of this company. A large part of our men stay with us the year around and we kept our hotel running all last winter."

Decreased Timber and Lumber Exports from United States

United States exports of timber during the twelve months ending June were valued as follows: 1916, $4,066,607; 1915, $3,177,976; 1914, $9,172,411. Of thees amounts the shipments to Canada were as follows: 1916, $356,065; 1915, $382,945; 1914, $1,047,441. Exports of lumber, including boards, planks, deals, joists, and scantling, were valued as follows: 1916, $27,912,300; 1915, $25,225,101; 1914, $57,781,467. Canada's portions of these were as follows: 1916, $4,028,636; 1915, $4,653,184; 1914, $10,434,000. The total exports of wood and manufactures of wood from the United States during the twelve months ending June were valued as follows: 1916, $60,707,229; 1915, $49,787,303; 1914, $103,179,640.

High Prices of Lumber in New Zealand

The price of lumber has materially advanced in New Zealand of late, notwithstanding the fact that the consumption has decreased more than 40 per cent. since the beginning of the war, according to a report by the United States Consul at Auckland. This increase is attributed to the advance in freight rates and the rapid consumption of the native supply. Freight rates on Douglas fir to New Zealand are now $36.49 per 1,000 feet, against $6.68 in 1908, and it is difficult to get deck space at this advanced rate. Douglas fir is well received for certain construction work, and there should be a good field for this lumber as soon as reasonable freight rates can be obtained.

The following table gives the prices per 1,000 feet of different kinds and classes of lumber in the markets of Auckland and Wellington, compared with those paid at the beginning of the war.

Kinds	Wellington		Auckland	
	1914	Present Price	1914	Present Price
Rimu: Ordinary building	$33.44	$34.64	$30.40	$31.62
Totara:				
Heart, sawn, building	70.56	76.64	60.82	65.69
Clean	77.86	85.16	65.00	70.56
Second-class	53.53	58.39	30.40	31.62
Kauri:				
Heart, sawn	93.67	97.33	68.13	68.13
Dressed	99.76	103.40	72.99	72.99
Douglas fir:				
Building quality, sawn	55.96	68.13	48.66	60.82
Selected	63.26	72.99	58.39	70.56

The imports of Douglas fir for 1914 amounted to 8,625,595 board feet, but it is generally understood that the imports for 1915 fell far below the above amount. Most of the better furniture and industrial lumber is imported, such as oak, ash, hickory, etc., and comes largely from the United States, United Kingdom, and Japan.

St. Francis Storage Dam

In the annual report of the Quebec Streams Commission, just issued, reference is made to the log slide provided for in the plans of the Lake St. Francis storage dam, now under construction. It is stated that in the basin of Lake St. Francis a great number of logs are cut each year, and are driven on the river to mills at East Angus and Bromptonville. To allow the passing of these logs there was left in the dam an opening 7 feet wide by 15 feet high. To bring these logs from the water level in the reservoir to that in the river below there has been provided a log slide 7 feet wide, 3 feet high, and 56 feet long. This slide will be adjustable for different water levels in the reservoir. This method of sluicing the logs has been criticized by certain parties interested in the log drive. They asked if it were possible to increase the amount of water passing through the log sluice opening so as to create in the reservoir immediately above the dam a current which will draw the logs to the opening. Another scheme has been under consideration, and the question will be settled satisfactorily for all concerned.

Death of G. A. Grier, Montreal

Mr. G. A. Grier, founder and head of the firm of G. A. Grier and Sons, Limited, Montreal, P.Q., died on October 24th at his home in Montreal. The late Mr. Grier was born in Cumberland, Ont., in 1849. He started in the lumber business in 1870 and was successful in it from the very first. At various times he was interested in the operations of a number of important manufacturing plants, but during the last fourteen years he has confined his attention to the wholesale business in Montreal, in which he was assited by his sons.

When Should Birch and Basswood be Cut?

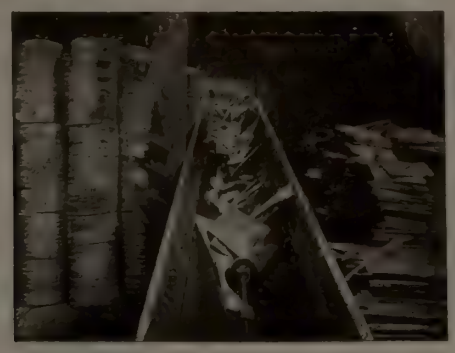
Editor Canada Lumberman:— Huntsville, Ont., October 17th.

Some of the lumbermen who have hardwood limits along rivers are resorting to a practice which, if continued to any extent, will seriously affect our markets for hardwoods, especially birch and basswood.

The practice referred to is to cut down the trees in June, when in full leaf, and allow them to remain whole till autumn, when they are cut into logs. This has the effect of reducing the weight of the wood, so it can be floated, but it also has the effect of destroying all the good properties of the lumber, rendering it unfit for any of the purposes that the natural qualities of the several kinds render them specially adapted for.

The result must be that lumber, sold as birch and basswood, is only such in name, having lost all the qualities of these desirable woods, and a great injury will be wrought to the trade. The practice should be discouraged by all who are interested in lumber, or in the benefits that accrue to our commerce through the manufacture and sale of it.

Anything that can be accomplished to stop this practice before it has caused the loss that it will inevitably cause will be rendering a national service. —A. P. Ebert.



Progress and Success Depend Largely on Economies of Production

LABOR-SAVING MACHINERY figures among the most important of these economies.

JEFFREY CONVEYING MACHINERY for handling Logs, Lumber, Refuse, Pulp Wood, etc., is built especially to Reduce Operating Costs in Saw Mills and Woodworking Plants, Lumber Yards, Pulp and Paper Mills.

If interested in an equipment, send us your specifications for our prices—if in doubt as to the material to use, let us assist you in the selection.

Send for 144-page Catalog No. 160-6 on Saw Mill Conveying Machinery.

147 to 151 Albert Street, Ottawa, Can.

Proper Care of Lumber

The care of lumber after it is cut is as important as proper sawing and grading. Lumber from sap and crooked logs not only springs in sawing, but warps, checks and stains very quickly. The smaller mills cannot afford to dip their stock, so they must stack it right from the saw.

It is astonishing the indifference or carelessness exercised in stacking lumber. The illustrations show the evil effects of poor, also the result of proper stacking. Fig. 1 shows the reckless method of a few; Fig. 2 some improvement, while Fig. 3 shows the correct way. In stacking for dry kiln it is not so important to keep sticks properly set, as there is not the excessive weight to spring the lumber. Fig. 1 shows the flat stacking. Only when lumber is to remain for a short time on sticks should this be resorted to, as there is no drainage. The careless method of placing the sticks ruins a lot of lumber from excessive weight, especially on a high stack.

When permanent stacking is done, it will pay to make good foundations. Concrete is best and will prove to be the cheapest. In Figs. 1 and 2 the ends are exposed; some lumber end-checks so badly as to damage it. The sticks should extend a little over the ends, as shown in Fig. 3; the ends are also better protected from weather. Give about 24-in. slope in 16 ft. All piles should be one width, say 12 feet, then 12-ft. strips can be used all over the yard. These strips can be saved from the edger (the smaller mills seldom make lath or pickets) and should be dry—the wider ones used at each end.

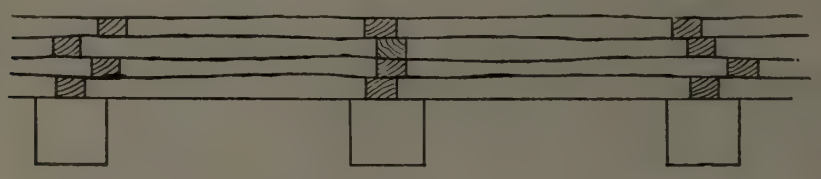

Fig. 1.

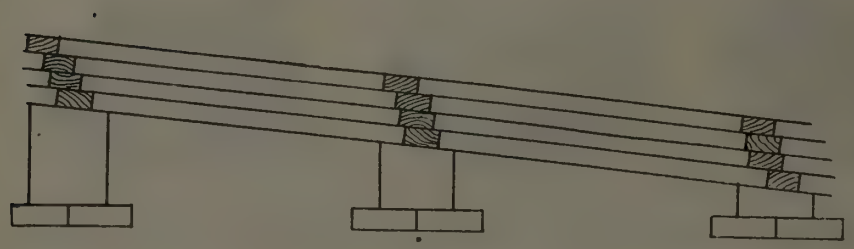

Fig. 2.

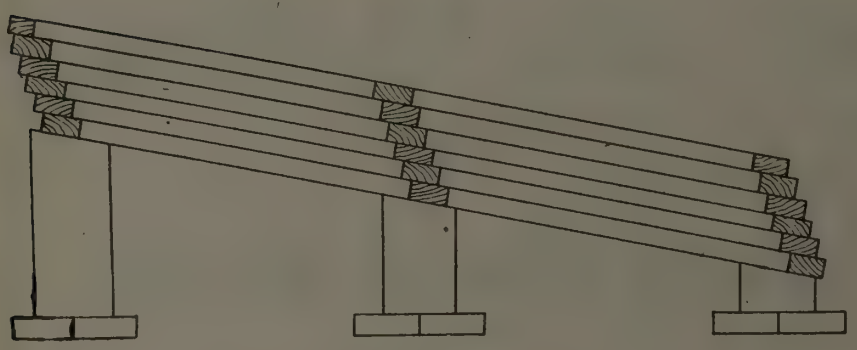

Fig. 3.

Some care must be exercised to get a good foundation. For a heavy or high pile, use 2 x 10 heart, 24 inches long, checked (that is, crossed) then a 12 x 12, cut the proper slope, will answer. Note that neither end of the lumber is exposed. If it does not pass over a trimmer, then the lower end will be irregular and the ends cannot all be covered. Sticks should be not more than 4 feet apart with 1-inch air space between boards.

All sap lumber, up to 4 x 6, should be stacked, and all piles when finished should be covered. Lumber properly stacked and air-dried brings a better price and there is a saving in depreciation of enough to more than pay for the stacking. Less room will be consumed and in case of fire it can be controlled better. There are other methods in use, principally the "X" stacking, but the one here described is in most general use.

A look at some yards pretending to stack properly will often show a few zigzag sticks, warping or springing the lumber. As stated, lumber often springs badly, particularly from crooked logs. Stacking cannot overcome edge springing, but flat springing, when properly stacked, will not deteriorate.—The Woodworker, Indianapolis.

Another Forestry Battalion

An Ottawa despatch states that the 230th (French-Canadian) Battalion has been changed into a forestry battalion, and that it has been decided that the unit will go overseas about December 1st. Lieut.-Col. Allard is chief recruiting officer of the battalion. The officers of the battalion have been notified that the unit will be sent to the south of France to cut timber. A complete reorganization of the battalion is being made. Lieut.-Col. de Salaberry will be in full command.

Miscellaneous Items of Interest to Lumbermen

C. H. Lovell, M.P., Coaticook, P.Q., died recently, after a long illness. The late Mr. Lovell had extensive lumber interests in various parts of Quebec Province.

Geo. Gordon & Company, Limited, Cache Bay, Ont., report that they will go into the woods much more extensively this winter than last winter, and that they expect to take out about 30,000,000 feet.

The exhibit of British Columbia lumber hitherto on view at the rooms of the Montreal Builders' Exchange, has been removed to the Forest Products Laboratories of Canada, 700 University Street, Montreal.

Another member of the staff of the Riordon Pulp and Paper Company, in the person of Mr. Samuel L. William, has joined the 242nd Forestry Battalion. Mr. William, who was head shipper at the Calumet, P.Q., mills of the company, has been appointed a lieutenant.

The Excelsior Lumber Company is the name of a new wholesale lumber firm which has opened offices at Room 44, 33 Richmond Street West, Toronto, under the management of J. C. Leigh. Mr. Leigh is well known to the trade in Ontario, having had long experience as a wholesale salesman.

Practically all the Douglas fir mills in the States of Oregon and Washington have become members of an organization recently formed under the name of "The Douglas Fir Exploitation and Export Company." The company will handle the export business of all the mills represented in its membership.

The barge "White and Friant" arrived at Owen Sound, Ont., on October 20th with a cargo of 500,000 feet of red pine deals from Michigan. The stock was transferred to cars at Owen Sound and shipped to Montreal, for export to Great Britain. The Union Lumber Company, Toronto, who have handled a large quantity of this line of export trade, purchased this stock in Michigan and made the sale to parties in Great Britain.

The Union Lumber Company, Dominion Bank Building, Toronto, have received a cheque for $10,367 from the Royal Insurance Company, Ltd., of New York, to cover their loss upon a stock of red pine deals that were destroyed by fire at Ogdensburg, N.Y., recently. The stock destroyed had been sold for delivery to the allied powers for use as trench timbers and in connection with coast defence works, etc. The cheque was the largest individual amount ever paid over by one company to meet a loss at Ogdensburg.

A. G. McIntyre, former manager of the Mattagami Pulp and Paper Company, Smooth Rock Falls, Ont., has accepted a position as manager of the Committee on paper of the American Newspaper Publishers' Association. His chief duty will be to represent the interests of the consumers of newsprint paper, and endeavor to relieve them as much as possible from the difficulties resulting from the shortage in production. He will practically act as a go-between between the paper manufacturers and consumers, with the idea of encouraging better trade conditions between them.

How Ocean Freight Rates Have Advanced

Interesting statistics in regard to Atlantic freight rates have been prepared by Representative Alexander, of Missouri, in connection with the shipping bill of which he had charge in the United States Congress. Taking Liverpool as a typical port of destination of American export lumber, it is shown that the rate on hardwood lumber ranged from 16½ to 18½ cents during the first half of the year 1914. In August it advanced to 23½ cents and by the end of the year had reached 38 cents. During 1915 it rose steadily and reached 95 cents on December 31. In January, 1916, it stood at $1.10.

Taking London as a port of destination for softwoods the rate is shown to have been 27c before the outbreak of the war, rising to 32c in August, 1914; 43½c in December, 1914; to 65c in March, 1915; to 76c in July, 1915; to 90c in October, 1915; to $1.00 in December, 1915, and to $1.20 in January, 1916. Since January still further increases have occurred.

On the Pacific there have also been large increases in ocean freight rates. According to Mr. Alexander's statistics the lumber rate from Seattle to Hong Kong and Manilla was $10 during 1914, but increased to $12 early in 1915, to $15 in the fall of 1915, and to $17 in January, 1916, making still further advances since that date. During the same period the rate to Sydney nearly trebled. To London from Seattle, the rate was $19.47 in the first three quarters of 1914, $24.33 in the last quarter, $30.43 at the end of 1915 and $54.75 early in 1916.

Bushmen's and Contractors' Supplies

Eiderdown Robes and Bags

LIGHT - DURABLE - WATERPROOF

A robe you can use for a dozen purposes. A robe that has been tried out and in hundreds of cases has proven its superiority over other makes and brands. The biggest value for the money and greater value than you can get for two or three times the price in other makes.

It is a regular occurrence for us to receive letters of this nature:

Winnipeg, Man., Jan. 13, 1914.

Smart Woods, Ltd.,
Ottawa, Ont.

Dear Sirs,—In reference to your Eiderdown Robes, I had one which has been in use for fourteen years in the Yukon and Alaska Territories. I have used it with nothing except a few small spruce boughs to keep it off the snow—in temperatures as low as 50 and 60 degrees in the open, and have felt no inconvenience whatever. I consider it better than a fur robe, as it is lighter, stronger, cleaner, and cheaper. A wolf robe 90 x 90 inches would cost $150 to $200, weigh twice as much, and not last half as long. A Lynx Robe is as warm, probably lighter, but has to be very carefully taken care of. A Lynx Robe of the same size could not be purchased for less than $400.

I don't think any robe can be compared with your eiderdown, and would say, "that by anyone who has ever used them in extreme temperatures they are considered as 'LEGAL TENDER.'"

Yours truly,

R. S. Inkster.

LEVIATHAN OR ANACONDA

A Leviathan Main Drive in constant service for four years at the plant of the Riviere du Loup Pulp Co.—24 in x 6 ply. No cost of up-keep; the belt has never been touched since the day it was installed.

LEVIATHAN and ANACONDA have been sold on a "make good" basis for over thirty years. If they hadn't made good we would have been out of business long ago. The fact that our business is progressing rapidly is ample proof of the merit of this belting.

With every belt we guarantee full value in service, dollar for dollar, horsepower for horsepower, and just as we have figured our tables of horsepower for the best results, just so in making the above statement, we not only expect to give equal service, but BETTER SERVICE, AND MORE ECONOMICALLY.

Why not give us a trial order and let LEVIATHAN or ANACONDA prove itself?

Canadian Wood Products Limited have been incorporated with capital stock of $40,000 and head office at Toronto, to carry on business as lumber and pulp manufacturers and dealers.

Dominion Hardwoods Limited, Deseronto, Ont., will probably proceed at once to rebuild their plant which was recently destroyed by fire. The town of Deseronto has carried a by-law granting the company certain important concessions.

The Hendum Lumber Company, Limited, has been incorporated with head office at Timmins, Ont., and capital stock of $40,000, with power to deal in lumber and operate saw and planing mills. Day and Gordon, Haileybury, Ont., are the solicitors for the company.

The Lincoln Paper Mills Company, Merritton, Ont., have let a contract for the construction of a sulphite plant, comprising a series of buildings, of steel, brick and concrete. The acid towers and digester buildings will be each 100 feet high, the other structures being one storey. The engineers are G. D. Jennsen & Company, New York, and the contractors, the Purdy and Henderson Company, Limited, Montreal.

The Colonial Lumber Company's mill at Pembroke closed down for the season on October 17th. The water situation recently made it very difficult for the company to obtain logs at the mill, notwithstanding the fact that it has many million feet in the water on the way to the mill. The logs in the water and those which they will take out of the woods during the coming winter will assure them of a plentiful supply for next season's operations.

Eastern Canada

The W. H. Kelly Lumber Company, Buckingham, P.Q., recently suffered a loss by fire.

Berthiaume & Sequin, sash and door manufacturers, Montreal, P.Q., have been registered.

J. C. Risteen & Company, Limited, recently lost their woodworking factory at Fredericton, N.B., by fire.

Wm. Thomson & Sons, lumber dealers, Thurso, P.Q., recently lost their planing mill by fire. The loss was covered by insurance.

The plant belonging to the St. Stephen Lumber Company, St. Stephen, N.B., was recently destroyed by fire. The loss is estimated at about $100,000.

The Nashwaak Pulp and Paper Company, St. John, N.B., have obtained a charter to carry on the operation of the plant of the Edward Partington Pulp & Paper Company.

Fire recently destroyed the sawmill belonging to Emile Gagnon, St. Narcisse, P.Q., incurring a loss of about $10,000. The owner will rebuild at once and steam power machinery will be required.

Fire from an unknown cause in Mr. W. A. Warman's lumber mill yard at "Atlantic Siding" near Ninon Station, N.S., destroyed about 1,400,000 feet of sawed lumber recently. The loss is partly covered by insurance.

Jas. A. Outterson, of the Carthage Sulphite and Paper Company, Ogdensburg, N.Y., has purchased 80,000 acres of timberland between Murray Bay and Tadausac, in the province of Quebec, which is estimated to contain over 800,000 cords of pulpwood. The price paid is between $250,000 and $300,000. Operations will be started at once on a large scale. It is expected that it will take sixteen years to clear the tract.

A bankruptcy sale of pulpwood, timber and rossing plant of the Battle Island Paper Company will be held at public auction at an unstated date in the near future. The property to be sold includes a rossing plant, about 25,600 acres of freehold timber property, and about 130 square miles of timber limits held under license, located on both sides of Mars River, Chicoutimi County, P.Q. Interested parties may write to Gannon, Spencer and Mitchell, Syracuse, N.Y., attorneys for the trustees.

Western Canada

The Victoria Shingle Mill, Victoria, B.C., was recently destroyed by fire. Only a small amount of insurance was carried.

The Rock Creek Lumber Company's mill at Waldo, B.C., has resumed operations after being idle nearly all summer.

Work has been commenced in connection with the erection of the McNair Shingle Mill at Port Moody, B.C. A mill will also be erected for cutting logs into shingle bolts.

The new shingle mill erected by Mills and Hamilton at Port Moody, B.C., is now in operation, with two machines. Additional equipment will probably be installed in the near future.

The sawmill of the Jackman Lumber Company at Jackman Station on the Fraser Valley branch of the B. C. E. R., was recently destroyed by fire,

the loss being estimated at about $30,000. The mill was owned by Mr. Sid. B. Smith, of Vancouver.

The Dominion Cedar and Shingle Company are constructing a shingle mill near the Lulu Island Bridge, New Westminster, B.C. It is expected that the mill will be ready for operation early in December.

The Cypress Lumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as timber merchants, sawmill and shingle mill owners, etc.

The mill at Ruskin, B.C., formerly owned by the E. H. Heaps Lumber Company, Limited, has been sold to Mr. Robert Dollar, of the Canadian Robert Dollar Company. The mill has a daily capacity of 100,000 feet of lumber and 500,000 shingles.

The Western Sandstone Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $25,000, to carry on business as timber and lumber merchants, sawmill and pulp mill proprietors, and to deal in lumber and wood of all kinds.

Midway Ranch, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $100,000, to carry on the business, among other things, of lumber and timber merchants, sawmill proprietors and manufacturers and dealers in timber and lumber of all kinds.

Cook's mill at Matsqui, B.C., which was closed down for a month and a half has resumed operations under the management of the British American Mills Company of Vancouver. A new road has been cconstructed to Cruikshank timber limits. The daily capacity of the mill is 35,000.

The Eagle Timber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $25,000, to carry on business as foresters, loggers, timber and lumber merchants, sawmill and planing mill proprietors, and to deal in and manufacture saw logs, timber, lumber and wood of all kinds.

The Pacific Mills Limited, a corporation owned and controlled by the Crown Willamette Paper Company of Portland, Oregon, is building large pulp and paper mills at Ocean Falls, B.C. The plant will have a capacity of one hundred tons per day and is expected to be ready for operation about April 1st, 1917. The chief stock holders in the corporation are H. L. Pittock, F. W. Leadbetter and F. F. Pittock.

An extension of the Hartnell Lumber Company's plant at Port Hammond, B.C., which will practically double its output, is under way. One new dry kiln has already been erected, and another will be started shortly. A new boiler is being installed, and arrangements are being made for extensive yards. The plant is at present working night and day. The company specialize in clear cedar siding, and cut the balance of the logs into shingles.

The Canadian Robert Dollar Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $40,000, to carry on business as lumber and timber merchants, and as manufacturers and dealers in lumber, sawlogs, timber, piles, poles, etc., and as sawmill, shingle mill and pulp mill owners. The company will erect a sawmill on Burrard Inlet, which will have a capacity of from 120,000 to 150,000 feet per day. Most of the output will be exported by the Dollar Line of Steamships, whose headquarters are being moved from San Francisco to Vancouver.

The Vedder River Shingle Company, of Chilliwack, B.C., have purchased from Frank King, of Vancouver, an extensive cedar limit in West Vancouver, which formerly belonged to the Frazer and McNair interests. It is estimated that the limit contains over 100,000,000 feet, mostly cedar of large size and good quality. The Vedder River Shingle Company will move their plant from Chilliwack to West Vancouver. This plant has a capacity of 175,000 shingles and this will be almost doubled. In order to overcome difficulties in connection with securing the timber the company will construct a flume a mile and a quarter long into the centre of the limit. The company will also erect new dry kilns in connection with the plant when it is established at West Vancouver.

Pacific Ocean Freight Rates Advanced

An interesting illustration of the way in which the war has affected Pacific Ocean freight rates is afforded by the case of the schooner Wm. Bowden, which recently took on a cargo for Sydney, Australia, under a charter providing for a rate of 90s a thousand feet, board measure. In April, 1917, the Wm. Bowden will return to the Puget Sound for another cargo for Sydney under a charter providing for a rate of 100s. Late in 1917 she will return to the coast and take on a cargo for Sydney at the rate of 120s, or at a proportionate rate for Adelaide, Australia, or South Africa. For the last two or three months the charter rate from the Sound to Sydney has been 125s per thousand feet, but the Bowden's charters, however, were made before the advance in rates which took place last summer.

A meeting of the Forestry Association of the University of New Brunswick was held recently and the following officers were elected:—Hon. president, R. H. Campbell, Ottawa; president, Prof. R. B. Miller; first vice-president, Geo. Miller; second vice-president, Lee Milburn; secretary-treasurer, P. R. Crandall.

Let Us Supply the Lumber

for that new house, extension or alteration. You will not have to pay us any more than ordinary lumber costs. You will, however, receive from us lumber much above the ordinary in every way. And time will prove our lumber the most truly economical. Come and we'll tell you why.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

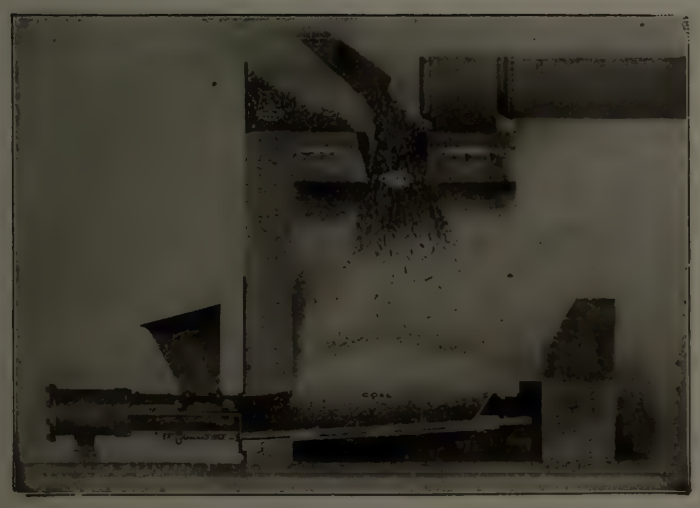
Make Steam and Dollars From Your Refuse



Arran gement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

Burn your saw mill and paper mill refuse in our special Jones Underfeed Stoker Dutch Oven and increase your profits.

Our stokers are installed in many of the most modern pulp and paper mills throughout Canada and the United States using a system combining the burning of mill refuse in conjunction with a small proportion of coal and are giving excellent results. If you have refuse to dispose of or if you depend on coal alone to fire your boilers the addition of a Jones Underfeed Stoker will make an enormous cut in your costs for steam.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

NICHOLSON-KENDLE Furniture Co.

MANUFACTURERS

Bed Room Suits, Dressers & Chiffoniers

Huntington, W. Va.

Feb. 11, 1916.

The Graton & Knight Mfg. Co.,
Philadelphia, Pa.,
Gentlemen:-

You will undoubtedly be interested to learn of the service we have derived from the 24" 3-ply Heart Belt we installed January 7th, 1913. This belt drives our entire factory, it has not been taken up since it was placed in operation, and is still giving perfect satisfaction.

Since installing this 24" Heart Belt, we have found it to our advantage to standardize on your Heart Belting throughout our plant. This will indicate more forcibly than words the satisfactory service we have derived from the use of your belting.

Yours very truly,
NICHOLSON-KENDLE FURN. CO.
C. W. Kendle

CWK/EC

"There's no use arguin' agin' a success."

—Josh Billings.

This bit of homely philosophy explains why the Nicholson-Kendle Furniture Company, and others, standardize on Heart Belting.

Manufacturers to-day are considering as never before efficiency and economy as applied to plant operation, and a belting must be "a success"—must make good before that particular belting is adopted as standard equipment.

In all industries wherever STRICTLY FIRST QUALITY HEAVY belting is required, Heart Brand is the selection, because it is made from the choicest oak tanned leather, tanned in our own tannery, slowly, uniformly, and expressly for belting purposes—because it is made carefully, intelligently, and honestly—because it is graded to a certain specified standard of quality—because it is "a success."

You, too, may place full dependence upon Heart Belting, for "There's no use arguin' agin' a success."

Good Fi
To Use

—To a layman, all files look alike. the skilled mechanic and practica superintendent will tell you they pr work with the "Famous Five" Files.

The steel in them is made from our formulas, which have been proven best after years of investigation and practical experience.

They are nicely balanced.

Their cutting qualities are good.

And then there is such a wide variety of grades, that the superintendent and buyer can select from the line the file he wants for any particular grade of work, and know that it will fulfill his requirements exactly.

You probably are already using them. But it is just as well to specify the "Famous Five" when ordering.

The "Famous Five" are:—

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

32-Inch Edger

Among the details of this sturdy high capacity edger we may mention:—

The two main frames supporting the bearings are built so as to be stiff and rigid, and are well braced with cast iron tie-plates. It is designed for portable or small stationary saw mills. By a slight change this machine can be made right or left hand to suit mill.

The arbor is 2½ inches in diameter, and made of the best machine steel. The drive pulley is 10 inches in diameter and 8½ inches face.

The arbor runs in three bearings, 6 inches long, all of which are lined with the best babbitt, and fitted with covered oil-cups of ample capacity.

There is one fluted feed roll 5 inches in diameter on either side of saws. These are power driven by means of belt and gears. There is a roll on top, in centre of machine, over which lumber can be passed back.

Saws used are 16 inches in diameter and will cut stock 5 inches thick. Machine is fitted with collars for two saws, one stationary and one movable.

The saw shifter casting has a long bearing on the sliding rod, which makes it shift easy. There is a lever jaw casting supplied to connect to saw shifter.

When overhauling your mill ask us about repair parts or new equipment.

Waterous Carriages

Steel Girder and All-Steel—For Every Size Mill

We build Saw Carriages.

Double Girder Carriages
With log openings of 24 in. to 50 in.

All-Steel Rack Carriages
With opening 36 in. to 72 in.

All Steel-Screw Carriages
With openings 60 in., 72 in., and 84 in.

No matter what size your mill or what kind of logs you are handling we have the right carriage for your use.

Our carriage equipment is of the very best. Waterous Dogs will hold the logs in place to stay; Waterous Setworks are accurate and durable; Waterous strength of construction will hold the carriage up to its work under the rack and wear of severe usage longer than most makes.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HAMILTON, ONT.

FOR SALE: Standing Timber, in Large or Small Blocks and Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 30 h.p. Generator, 250 volt.

1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Resaw Feed Works

The mill man who possesses a keen sense of the importance of a well designed Feed Works seldom goes wrong in his selection of a Sawmill Resaw.

He has a right to assume that its builders know, or should know, enough of the principles of band sawing to build a machine that will properly carry the blade and give it the required protection—yet even on that point there is plenty of chance to go wrong. But when it comes to the matter of properly getting material to the saw and keeping it everlastingly at it, he knows that depends entirely on the resaw feed works and the care and forethought with which it has been built. Into

Yates - formerly BERLIN

Heavy Duty Vertical Band Resaws

is built every element of successful feed works construction—*Speed, Power, Activity, Accuracy* and *Ease of Setting,* and a carefully selected range of speeds with *Single Hand Wheel Control.*

Not content with this, we have recently added the new *Yates Selective Yield Set Works* enabling the operator to saw to gauge either side of blade. These are a few of the things that the buyer gets with his Yates Heavy Duty Resaws.

And these are the reasons why users say Yates Resaws meet every operating contingency.

Our new book "Band Sawing Machinery" tells all about these capable machines.

Write for a copy while you have it in mind.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, November 15, 1916 No. 22

A Critical Moment for the Canadian Lumber Export Trade

More than a year ago the Canada Lumberman published a number of articles specially designed to awaken among lumber manufacturers and exporters in Canada an adequate appreciation of the importance of studying the export markets for Canadian timber and lumber which will develop after the war, and even the markets which can be expected to develop during the course of the war. For the time being the best that we could do in the way of stirring up interest was in connection with the trade which then seemed likely to develop first of all, namely, that in ready-to-erect, portable houses. The firms in Eastern Canada that were in a position to take care of such trade did form an association, which went to work systematically upon the problem, prepared plans and specifications, constructed and shipped to France a number of sample houses, and sent a representative to France, who, we believe, has been able to promote their interests with some measure of success.

So far as the general lumber trade is concerned, however, although we believe that individually they are keeping closely in touch with the situation as it exists to-day, and are keeping their ears to the ground to learn of future developments as far as possible in advance, there has been nothing done that we have learned of, in the way of organizing, handling, and developing the business collectively and efficiently. We believe that an organization should be formed immediately with this object in view. Our conviction in this regard is strengthened by the course which has recently been taken by lumbermen in the United States, as reported in the Canada Lumberman of October 15th, an association having been formed for the definite purpose of sending a number of skilled representatives abroad to get in touch with the situation and to develop the demand for United States timber and lumber. The fact that the United States trade and industry are taking this step makes it all the more imperative for Canadians to do the same thing. It is, indeed, a pity that we were not first in the field. Now, however, unless an effective organization is established, the bulk of the trade will go to the United States, and not only that, but the influence of this aggressiveness on the part of our competitors to the south will be of a lasting nature and give them the upper hand in foreign markets long after the abnormal demand growing out of the war has passed into history.

The Department of Trade and Commerce at Ottawa has already done something towards paving the way for the development of Canadian trade in this connection by sending Mr. H. R. MacMillan on a trip around the world to study the foreign markets for lumber and make reports upon them. Regarding the situation, the Department of Trade and Commerce, in its latest weekly bulletin, says:

"Canadian lumbermen in all the provinces of the Dominion should get together and concert measures for the efficient disposal of their products in the wide-opening markets of the world. There will be an immense demand for lumber in Europe during the reconstruction period following the war. Why should not Canadian lumbermen get their share of this trade? In Australia, New Zealand, South Africa, India, China, the West Indies, and South America there are opportunities for the sale of Canadian lumber awaiting organized efforts on the part of the great lumber interests.

"As a result of a conference between the various lumber manufacturing organizations of the United States and representatives of the United States Government, a corps of experts will start for Europe early in November to study the conditions of the lumber market likely to prevail during the reconstruction period following the war. The expedition is being largely financed by the lumbermen themselves.

"Before taking up the question of how to organize the American lumber industry to best secure the great volume of foreign lumber business that must come to the United States even before the European war ends, detailed reports were given of the conditions abroad by the varied interested organizations, as well as from governmental agencies."

After summarizing the conditions in various European countries to-day, so far as the demand for lumber is concerned, and the situation that will develop when the reconstruction period begins, the bulletin says that the enterprise of the United States association will not end with sending experts to report on market conditions in Europe. The lumbermen propose to organize export associations, with foreign sales agencies, to secure and distribute orders for American lumber.

The lumbering interests represented at the conference agreed that American lumbermen of all sections should unite to secure this market, regardless of whether they are exporters or not.

There is still time to work out an organization of this nature in Canada and to get into the field before our Southern competitors have effectively forestalled us. Canadian exporting firms which feel satisfied that they can individually secure plenty of this trade after the war should not look upon the matter from the individual point of view. They stand to profit as much as anyone by the development of an organization formed to increase our share in the business abroad, and they stand to lose enormously if the aggressiveness of the United States is allowed to instill into the minds of Europeans the idea that the best source of supply for them is in the United States.

It will not take long to work out and create an effective export association in connection with the Canadian lumber manufacturing industry if it is gone about in an enthusiastic manner. The expense of sending representatives abroad will be infinitesimal compared with the value of the results or compared with the cost of neglecting the opportunity.

Co-Operation the Foundation of Success

At the annual meeting of the Western Forestry and Conservation Association, which was held recently at Portland, Oregon, a number of excellent addresses were delivered, among them being two that were of special interest to Canadians. Mr. M. A. Grainger, chief of the British Columbia Forest Service, told of what British Columbia is doing to help its lumber manufacturers. Over one-third of the Forest Service staff have gone to the war, and therefore the work suffers to a

great extent; nevertheless much good work is being done. Conditions confronting the industry in British Columbia are similar to those confronting the manufacturers of the Pacific Coast States. The government realizes that forest conservation can only be carried out with the co-operation of the lumbermen and the development of the market for lumber products, as well as through the proper adjustment of production to demand. As market extension presents the only way in which immediate results can be secured, this is the problem the government attacked first of all. The chief efforts of the Forest Service, therefore, were directed towards the markets overseas and those of the Canadian prairies and Eastern Canada. A movement has been planned and is being carried out for increasing the consumption of lumber in the prairie districts, with the co-operation of the government agricultural authorities and the agricultural experts of the farmers' universities. The farmers' experts are anxious to improve farming methods and conditions, and such a movement goes hand in hand with a campaign for increasing the use of lumber which is really necessary in order to promote better and more profitable farming.

The method in which this campaign is being carried out is a practical one. Ten booklets have been published, containing information upon farming subjects, giving complete lists of building materials for the erection of any buildings advocated, and also including detailed plans. Large scale working drawings are also being furnished at the cost of production, namely, from 10c to 15c. In addition to this, the bulletins are being advertised in local and farm papers; travelling exhibits are being sent out in charge of trained men and displayed at all farmers' conventions, fairs, etc. Free motion picture entertainments are also being provided.

The value of all this work depends entirely upon the enthusiasm put into it and the thoroughgoing and effective way in which it is carried out. Similar methods are being followed in Eastern Canada, but the lumber products are being advertised to the general public there, as well as directly to government and municipal engineers, architects, contractors, lumber wholesalers, and the trade generally. The Eastern representative makes a point of being on hand whenever building codes are being revised in a city, or when specifications for big contracts are under consideration, and makes a special point of seeing that the legitimate claims of British Columbia materials are fully considered. The next few years will see many big problems tackled by the united efforts of the Forest Service and the lumbering industry.

A brief address was also delivered by Mr. H. R. MacMillan, former trade commissioner for the Canadian Government, who dwelt chiefly upon one important point. Instead of sitting and preaching optimism, he said, they ought to organize and co-operate to get $2 more a thousand, and thus insure prosperity and happiness for all. He spoke chiefly in the interest of international co-operation, saying that British Columbia had only one-third as much timber as the Pacific Coast states, but that one-third was enough to make trouble for the United States manufacturers for the rest of their lives, without co-operation.

Hardwood Grading Rule Changes Still Under Discussion

The most important discussion of the grading of hardwoods that has occurred for many years was that which took place last June at the annual meeting of the National Hardwood Lumbermen's Association in Chicago and resulted in the changes submitted by the grading rules committee being defeated, leaving the rules practically as they stood. It will be recalled that there was a vigorous fight upon the matter at that time, and that those who desired certain changes, while taking the defeat philosophically, were not disheartened, but determined to keep up the agitation. The Northern Hemlock and Hardwood Manufacturers' Association have held an important meeting to discuss this situation, and adopted a proposed set of changes to the National rules. These changes will be submitted for final approval to the Michigan Association, and then will be discussed once more by the Northern Association, after which the plan is to make a strong effort to have them adopted by the National Hardwood Lumbermen's Association at its next annual meeting.

Canadian hardwood manufacturers, wholesalers, and consumers have become closely allied in their interests with the National Hardwood Lumber Association, many of the manufacturers and wholesalers being of that body. They have watched the grading rule situation closely and jealously, their interests being so intimately affected by the grades established. At the meeting last June, when the changes originally proposed were defeated, the efforts of Canadian members of the association had much to do with the result. They will, therefore, be interested in learning about the move taken by the Northern Hemlock and Hardwood Association, and for this reason we present the proposed changes now adopted by that association, which are as follows:

Hard Maple and Beech.—Selects (new rule): Grade to be made from best face of the piece. Selects must be 4 inches and wider, 8 feet and over long. Four, five, and six-inch strips shall have both edges free of standard defects; pieces over 6 inches wide shall have one edge free of standard defects. Pieces 4 inches wide shall have one clear face; pieces 5 inches wide, 8 to 11 feet long, shall have one clear face; pieces 5 inches wide, 12 feet and longer, admit one standard defect or its equivalent. Pieces 6 inches and over wide shall grade not poorer than seconds on one face. The reverse face of pieces 5/4 and thinner will admit sound defects, and shall be at least 85 per cent. of the grade No. 1 common, and the remainder shall grade not below No. 2 common. The reverse face of 6/4 and thicker shall admit of sound defects, but shall not grade below No. 1 common.

No. 1 Common.—(Changes.) Six feet and over long; not over 30 per cent. shorter than 10 feet. Pieces 3 and 4 inches wide, etc. (no further change).

Hard Maple and Beech.—Nos. 1 and 2 common (flooring stock) shall be graded from the best face; 3 inches and wider, 4 feet and longer. Heart rule does not apply. Percentages of clear face cuttings to be the same as for Nos. 1 and 2 common regular grades; back face of cuttings must be sound.

Ash, Birch, and Sycamore.—Select (new rule): Grade to be made from best face of piece. Selects must be 4 inches and wider, 6 feet and over long. Four, five and six-inch strips shall have both edges free of standard defects; pieces over 6 inches wide shall have one edge free of standard defects. Pieces 4 inches wide shall have one clear face; pieces 5 inches wide, 8 to 11 feet long, shall have one clear face. Pieces 5 inches wide, 12 feet and longer, admit one standard defect or its equivalent. Pieces 6 inches and over wide shall grade not poorer than seconds on one face. The reverse face of pieces 5/4 and thinner will admit sound defects, and shall be at least 85 per cent. of the grade No. 1 common, and the remainder shall grade not below No. 2 common. The reverse face of 6/4 and thicker shall admit of sound defects, but shall not grade below No. 1 common.

No. 1 Common.—(Changes.) Six feet and over long.

Birch.—Nos. 1 and 2 common (flooring stock) shall be graded from the best face; 3 inches and wider, 4 feet and longer; heart rule does not apply. Percentages of clear face cuttings to be the same as Nos. 1 and 2 common regular grades; back of cuttings must be sound.

Basswood, Soft Elm, Soft Maple, and Buckeye.—Seconds must be 6 inches and over wide.

Selects (new rule): Grade to be made from best face of piece. Selects must be 4 inches and wider, 6 feet and over long. Four, five, and six-inch strips shall have both edges free of standard defects; pieces over 6 inches wide shall have one edge free of standard defects. Pieces 4 inches wide shall have one clear face; pieces 5 inches wide, 8 to 11 feet long, shall have one clear face. Pieces 5 inches wide, 12 feet and longer, admit of one standard defect or its equivalent. Pieces 6 inches and over wide shall grade not poorer than seconds on one face. The reverse face of 5/4 and thinner will admit of sound defects, and shall be at least 85 per cent. of the grade No. 1 common and the remainder shall grade not below No. 2 common. The reverse face of 6/4 and thicker shall admit of sound defects, but shall not grade below No. 1 common.

No. 1 Common.—(Changes.) Six feet and longer.

The continued earnest agitation of the Northern Hemlock and Hardwood Association for changes to make the rules more in keeping with the interests of their trade indicate that the subject was not settled at the last annual meeting of the National Association, and that another big discussion is on the boards for the next annual. There are several months yet before that meeting will take place, and it is more than possible that the grading rules committee of the National and the bureau of grades of the Northern Association will be able to hold a series of conferences before that time which will result in something being done to simplify the situation and to meet the wishes of all parties.

Woods Operations in Ontario Reduced

Reports from Manufacturers Show How Labor Scarcity and High Cost of Provisions will Curtail Coming Winter's Output

Stocks Low—Output Small—Demand Increasing.

Marmora, Ont.

Editor Canada Lumberman:—

Lumbering operations in this vicinity during the coming winter will be very limited indeed. The scarcity and high price of labor and the marked increase in the cost of supplies make it almost impossible to carry on logging operations at all. As nearly as we can make out at the present time, we feel that the prices of lumber must advance very sharply, at least 25 per cent., and probably 50 per cent. in some lines, over what they have been during the past summer. We do not expect that our cut will exceed a million feet, and will probably be even less than this, for lack of labor. About one-half of our cut will be hemlock, one-quarter of the balance pine, and the rest will be made up of basswood, ash, and cedar. Dry stocks are getting very scarce throughout this section, and, judging by numerous enquiries from Canadian, as well as United States, firms, dealers are anxious to contract for all they can get, even at considerable advances over the prices that have prevailed this fall. Sales are considerably better than last year, and our stocks are already running low in many sizes.—The Pearce Company, Ltd.

* * *

Twenty-five Per Cent. Reduction.

Thessalon, Ont.

Editor Canada Lumberman:—

We figure on putting in about 12,000,000 feet this winter, which will consist of about 75 per cent. white pine and 25 per cent. red pine. We put in last year about 16,000,000 feet, and it all depends on labor conditions if we put in 12,000,000 feet this year or not. Labor is hard to get; wages are high, as well as provisions and material. We figure that it will cost at least five dollars per M. feet more to lumber this year than last, and the lumbermen will have to get a large increase in the price of their lumber next season in order to meet the large increase in cost of production. It looks to us as though during the coming season there will be quite a shortage of lumber, as most of the operators are decreasing their output, and some are not lumbering at all this winter owing to the high cost of production and scarcity of labor.—Hope Lumber Company.

* * *

Higher Prices Certain for Next Season.

Midland, Ont.

Editor Canada Lumberman:—

Last winter we took out stock approximately as follows: 5,000,000 feet bush scale white pine, 775,000 feet bush scale red pine, 250,000 feet bush scale spruce, 35,000 feet bush scale cedar. Owing to conditions existing this season from the standpoint of the high cost and scarcity of labor and the expensive supplies, we have concluded to reduce this output by at least one-third. What we do take out, so far as classes of timber are concerned, should bear about the same ratio as last winter's output. In view of the substantial increased cost of production and the reduced output, we anticipate higher prices for next season.—Chew Brothers.

* * *

Will Take Out Large Amount on Account of Fires.

Ottawa, Ont.

Editor Canada Lumberman:—

Last season we took out about a million feet of spruce, a million and a half feet of red pine, and about four million feet of white pine. This season our output will be about a million and a half feet of spruce, two million feet of red pine, and about twelve million feet of white pine. We do not know what quantities our neighbgrs are going to take out this season, but we think some of the lumbermen who have had extensive burns during the past season will take out more than they intended; but, in any event, logging operations will be just about double the cost of last year, owing to the very high rate of wages and exorbitant price of all foodstuffs.—Shepard & Morse Lumber Company.

* * *

Doing Nothing This Winter.

Peterboro, Ont.

Editor Canada Lumberman:—

Owing to the scarcity and high cost of labor and supplies for operating, and with the prospect of not being able to get help to saw or handle lumber next summer, we have decided not to take out any logs this season. Last winter we took out two and a half million feet of pine and one and a half million feet of hemlock, cedar, etc., logs, with an advance of 40 per cent. in cost for driving and sawing and no increase in the selling price of lumber.—Estate of Alfred McDonald.

* * *

Output Much Reduced.

Toronto, Ont..

Editor Canada Lumberman:—

We figure on bringing out this year about 2,500,000 feet of hemlock, 250,000 feet of spruce, 250,000 feet of birch, 250,000 feet of pine. In other years our stock ran up around 5,000,000 feet, but, owing to the shortage of labor, last year we did not get this amonut, nor do we anticipate getting more than about 3,250,000 feet this year. Last year we took out 3,000,000 feet of hemlock, 285,000 feet of spruce and balsam, 550,000 feet of birch, 250,000 feet of pine, amounting to a little better than 4,000,000 feet.—Standard Chemical, Iron, and Lumber Company, Ltd.

* * *

Logging Operations Reduced One-half.

Pembroke, Ont.

Editor Canada Lumberman:—

Owing to labor and the price of supplies, we are only putting in three camps this season, about half our usual winter's operations. We will take out probably from ten to twelve million feet. Besides this quantity we have twenty million feet of old logs in the water, not yet sawn. About 60 to 70 per cent. of this winter's operations will be white pine, balance red pine and spruce. The market for lumber at present is exceptionally good, all lines being in demand. Prices have advanced on many lines materially since last spring.—The Colonial Lumber Company, Ltd.

* * *

A Poor Outlook for the Log Supply.

Sudbury, Ont.

Editor Canada Lumberman:—

It is very hard to say how many logs we will take out this season. If we cannot procure labor faster than we have been doing up to date, we will not get out enough logs this year to run our mills on a day shift. Last year we took out about three-quarters of a million pieces, which we have just completed sawing. We would like to get as many this year in order to have work for the mills next season, but the outlook is doubtful, owing to the shortage of labor. We manufacture only pine.—Spanish River Lumber Company, Ltd.

* * *

Expects a General Reduction of About One-half.

Otter Lake, Ont.

Editor Canada Lumberman:—

We are taking out about the same quantity of logs this winter as we took out last, but in our vicinity the cut appears to be reduced by about 50 per cent. Trade conditions are much improved of late. Stocks are scarce and prices firm, with some advances. The cost of operation has increased from $5 to $8 per M., and consequently we must look for a considerable advance in order to continue operating—Hocken Lumber Company, Ltd.

* * *

Not Operating This Winter.

Pembroke, Ont.

Editor Canada Lumberman:—

We are not going into the bush this season. We have about five million feet of logs in the water, which, together with some logs we intend purchasing, will keep our mill running next season.—Petawawa Lumber Company, Ltd.

* * *

Hard to Get Men for Camps.

Owen Sound, Ont.

Editor Canada Lumberman:—

We intended operating four camps in the woods this winter, but as yet have only sufficient men for one camp. Cannot say at present what quantity we will be able to take out.—John Harrison & Sons Company, Ltd.

* * *

No Change in Bracebridge Output.

Bracebridge, Ont.

Editor Canada Lumberman:—

We will have about the same amount of stock this year as last, which was about two million feet, chiefly hemlock.—J. D. Shier Lumber Company, Ltd.

* * *

Cleveland Sarnia Saw Mills Company Not Operating.

Sarnia, Ont.

Editor Canada Lumberman:—

We are not taking any logs out this season.—The Cleveland Sarnia Saw Mills Company, Ltd.

Small Cut for Graves, Bigwood & Co.

Byng Inlet, Ont.

Editor Canada Lumberman:—

We will put in about three million feet of white pine during the coming winter.—Graves, Bigwood & Co.

According to a petition for administration of the estate of the late John Hendry, well known lumberman of Vancouver, B.C., the gross value of his estate was $1,248,829 and the net value $725,783.

The Hardwood Situation in Canada

Good Trade Certain During War—Little to Fear After Peace Comes—1917 Output Sure to be Small

By, A. E. Clark

Early in the year 1916 we had an overwhelming situation to handle, arising out of the fact that in addition to more or less disorganization in the hardwood trade situation in Canada and the United States because of the war, our difficulties were increased by the British War Office refusing to permit the importation of certain hardwoods into Great Britain. The good grain crop of 1915, however, has had a steady tendency to improve the Western trade as well as the Eastern trade, until at the present time the furniture, agricultural implement, and piano trades are in a very much improved state, if not back close to normal conditions. The huge munition orders placed in Canada, with their great requirements of boxes for the consignment of these goods, have eaten into the supplies of hardwood a great deal further than any casual observer would imagine. In all probability, if the situation were thoroughly examined and an estimate made, it would be found that the embargo against Old Country shipments has been practically, if not fully, offset by the consumption of hardwoods for these munition boxes. This, with the improved local condition and the tendency on the part of the manufacturers of lumber to go easy in their production last year, together with a certain measure of shortage of labor, has gone far to place the hardwood situation back upon a healthy basis. At the present time there is possibly less hardwood, both in high and low grades, on the market for immediate shipment than there has been for several years. This applies very particularly to birch, basswood, elm, and maple. We are now facing a condition of good demand, short supply, and very little prospect of relief from our 1917 production. We have a shortage of labor as the main cause whereby it will be impossible to get much more than a 50 per cent. cut. Added to this is the huge increased cost of production, which any cautious manufacturer is inclined to consider seriously before going ahead. Anyone who looks at it from all these points of view must realize that if he is to get any kind of an adequate profit from his operations the increase in price will have to be very considerable.

We have still practically a year to go before the lumber that will be produced in 1917 can be marketable, and the manufacturer naturally asks himself what the condition will be at the end of 1917, when this lumber is to be put upon the market. Will he get his increased costs out of the production, plus a reasonable margin of profit, or will the war be over and a certain measure of demoralized trade be facing him, making it impossible for him to get back the capital he has invested? There are certain reasons for viewing the situation more or less in this light, although any sort of normal conditions at all should surely be able to take care of a possible less than 50 per cent. production. In my opinion, the situation should be approached cautiously, but everything points to a reasonably good market. The slump in trade which naturally will be due us from a good many sources when the war ends should be, in a considerable measure, offset by the demand for export, since there has been no hardwood exported, at least in any quantity, during the year 1916.

The war has no doubt done much for the lumber manufacturer in the way of improving efficiency and showing him where hardwood can be used to advantage in manufacturing articles that he has not thought of previous to war times, and has created a considerable number of markets that will remain after the war. Should the war continue, with its difficulties in the way of securing adequate supplies of mahogany, the field for local hardwood lumber in general, and birch in particular, should be a large one.

I would sum it up that, with war conditions prevailing for another year, the hardwood trade will be exceptionally good, and if the war does come to a speedy end, the hardwood manufacturer should not have very much to fear.

Suggests Eliminating the Primsoll Line

Now that the Dominion Government is taking such an interest in helping the lumber manufacturers to develop foreign markets nothing is being left undone to insure British Columbia exporters as to many advantages to help in securing trade as it is possible for the government to give. As an example of this attitude the present agitation to remove any Plimsoll regulations from British ships carrying lumber to Australia is worthy of notice. At present Australian regulations prohibit British ships entering any Australian port loaded below a certain mark. An American schooner can load lumber at either a Canadian or American port until the water comes half way up the hatch combings and still enter Australian ports, thus allowing the American vessels to carry from 150,000 to 200,000 feet more lumber than British vessels of the same capacity. Thus it is said that the British vessels are placed under a disadvantage. As there is no Plimsoll mark in Canada and ships have to be loaded only to the satisfaction of the underwriters, the question of loading regulations in this country will probably be easily settled, but the question given prominence now is what steps will be taken by the Canadian Government to induce the Australian Government to change its regulations so as to enable the vessels built in British Columbia, and other British-owned boats, to load lumber on the same basis as the American vessels.

As a reason for removing all restrictions regarding a Plimsoll mark for vessels loaded with lumber Capt. Robert Dollar, of San Francisco, Cal., is quoted as having said at a recent hearing on the matter in Washington, D.C.: "Vessels carrying lumber on the Pacific Coast must be free from any load line regulations while carrying lumber, but if they are carrying anything else they must be subject to the same regulations as other ships." Representations have been made to Sir George Foster and other government officials regarding the necessity of placing British-owned vessels on an equal operating basis with those of any other nation, and it is the prediction that before the fourteen ships now being built in British Columbia shipyards are completed—the vessels are to be largely used in carrying lumber from British Columbia to Australia—a perfect understanding will have been reached between the Canadian and Australian Governments with regard to any details affecting the overseas trade.

Contractors Responsible for Loss

The case of the Canadian Spool Cotton Company, Ltd., Montreal, against Peter Lyall & Sons, contractors, Montreal, and Brown & Vallance, architects, Montreal, has been heard by the Court of Review, and judgment has been given confirming the judgment of the Superior Court rendered in April, 1914, condemning the two defendant parties to pay, jointly and severally, $71,120.85, and condemning the contractors, Messrs. Peter Lyall & Sons, Ltd., to pay $4,098.72 additional in damages. This is the well-known case in which the plaintiff company sued on account of the timbers in their cotton mill having developed dry rot a short time after the building had been completed. The contract for the construction of the building at Maisonneuve, P.Q., was let in 1907, at a cost of $218,000. When the dry rot was discovered the floors of the mill were sagging and threatened to collapse. The affected wood was taken out and replaced with new timber, but the defects seemed to increase, and in 1910 all the timbers appeared to be affected. The company protested to the contractors and architect, and finally removed the whole of the timber and substituted steel. Then they brought suit against the contractors and architects for $98,802. The Superior Court found in their favor to the extent of $71,120.85, and this is the judgment upheld by the Court of Review.

One of the chief points upon which the argument in the case centred was whether the appearance of the dry rot in the timber could be considered an inevitable accident. The Court of Review held that this was not the case. Dry rot was not "an act of God" in the sense in which man could not guard against it. Dry rot could be discovered. There was a dry rot germ, and it could be ascertained whether or not this germ existed in the wood. Mr. Justice McDougall, in the course of his judgment pointed out that the conditions of the contract included a provision that Georgia pine, longleaf, straight grain and free from knots, was to be used. The proof established that another quality of timber had been used. The defendants had pleaded that it was impossible at the time to get the grade specified. This plea had not been borne out by the evidence, which was that Georgia pine of the grade specified in the contract was on the market. It was very expensive, and the contractor, Mr. Justice McDougall said, "not wishing to go to this expense, sought a cheaper grade and put that into the mill. The concensus of opinion, as expressed in the evidence, was that this second quality, or lower grade pine, is more liable to dry rot than the higher grade timber. In using it the contractor took the risk, and, as dry rot set in, the court comes to the conclusion that the builders are responsible."

The claim against the contractors alone for $4,098.72 for repointing brick work was held by the court to be a matter of specific performance, "and as it was not executed in accordance with the specification, the contractors are bound to pay the costs of having the work done over again in the manner called for."

Eastern Lumbermen's Association Organized

The organization of lumbermen of the Province of New Brunswick and the State of Maine, which has recently been formed, is to be known as the Eastern Lumbermen's Association. At the last meeting twenty-five members were enrolled, and the following officers were elected: President, R. H. McWilliams, of Stetson, Cutler & Co.; vice-president, A. W. Brown, of the St. John River Lumber Company; secretary, William H. Cutler, of Bangor; treasurer, W. A. Finnigan, of Bangor; executive committee: Samuel H. Boardman, of the Guilford Manufacturing Company; William H. Murphy, of Old Town, Me.; George Merrill, of Patten, Me.; Mr. Cobb, of Calais; John Rainey, of Portage Lake; John Morrison, of Fredericton, N.B.; S. J. Hinch, of Danforth, Me. There were about fifty lumbermen present at the meeting, and all were enthusiastic as to the future of the association. Operators, manufacturers, and wholesalers in the Maritime Provinces and Northern New England are eligible for membership. It is believed that this is the first international organization of the kind.

Nova Scotia's Revival in Shipbuilding

Click of the Caulker's Mallet Again Heard—Great Quantities of Timber Consumed in Vessel Production

By Elihu Woodworth

Necessity is the mother of shipbuilding in Nova Scotia. This means that among the early settlers of this province the need of vessels became so imperative that men with no knowledge of the art of building ships were induced to attempt their construction. At first the early settlers devoted their energies to the destruction of the forest, and millions of feet of prime lumber and thousands of cords of excellent fuel were burned on the ground to clear the land and prepare it for cultivation. In course of time the landowners began to realize that burning their timber was not the best method of getting its value, and, consequently, they tried to discover a more profitable way to dispose of what was left. They soon learned that there was a demand for ton-timber in England, and that spruce deals and boards could be sold at paying prices at some of the provincial ports. They had excellent material for ton-timber and knew how to manufacture it, and they had an abundance of spruce timber ready to be converted into merchantable lumber, but they had no facilities for getting their goods to market. Their urgent need was ships, and ships of any kind they were unable to get. But they were a resourceful people, accustomed to overcoming difficulties, so when they could not get by other means the vessels they so urgently needed, they resolved to build them for themselves. Accordingly they commenced ship-building, and, as they did not know their trade, they learned it as their work went on. Probably the first vessel they turned out would not compare very favorably in finish and appearance with those built in the same localities to-day, but they were staunch and strong, and admirably adapted to the purposes for which they were built. At first the number of shipbuilders was limited, but when their ventures proved successful many others were eager to engage in the business. Sturdy brigs were built and loaded with ton-timber, and sometimes when they reached the English market both the vessel and cargo were sold. Small schooners were built for the coasting trade, and sawmills with a single saw, which were erected on nearly every stream and known derisively as "jackknife mills" supplied cargoes of deals and other lumber. Shipbuilding soon became a large and profitable industry. Larger and better vessels were built, and found plenty of employment, and the time soon came when Nova Scotia ships were to be found on every sea. Builders who did not care to employ their own ships could sell them at remunerative prices, and the shores of the province were spangled with shipyards.

Decline of the Industry.

A change was inevitable, but its approach was so gradual that it found many unprepared. Shipbuilding had undoubtedly been somewhat overdone, and the result of the keen competition that ensued was low prices for ships and greatly reduced freight rates, but the final blow was struck with the advent of the tramp steamer. Then freight fell to figures which would not pay a sailing ship's expenses, and the demand for large sailing vessels ceased entirely. Practically all the shipyards were closed, and fine vessels registering from 1,500 to 2,500 tons were sold for a tithe of their value and converted into barges for carrying coal or gypsum. The only sailing vessels for which any work was left were coasting schooners of moderate tonnage and a fleet of small schooners engaged in the fisheries. A very few builders still had faith in wooden vessels, and turned off an occasional tern schooner to trade with the West Indies and South America, and a few small vessels had to be built every year to replace the schooners lost on fishing cruises, but the general concensus of opinion was that wooden shipbuilding was dead, never to be revived again. Then came the great war, the undreamed of scarcity of bottoms, and the consequent sharp advance in freights. Every available tern schooner was requisitioned and loaded with lumber for the United Kingdom, although many claimed they would be failures as ocean carriers. When these vessels made successful voyages and proved superior to the few "square-riggers" that could be obtained, there were indications that a revival of shipbuilding was coming, but the revival did not fully materialize until the present year. Take, for instance, Parrsboro Shore, which was formerly a famous shipbuilding district and which has never gone entirely out of the business. Last year Parrsboro Shore turned out a fine four-master of over 500 tons register, but this season three fine vessels have already left her shipyards—one a tern schooner of 425 tons, another a four-master of 528 tons, and a second three-master has 418 tons to her credit, while four others are still on the stocks, only one of which will register less than 400 tons. More than that, each of the five shipyards will build at least one vessel next year, some of which will be larger than this year's output.

Activity at Many Points.

On the south shore of Nova Scotia there is great activity in the shipyards, and some builders are forced to decline further orders. Shelburne is building nine vessels, but some of them are fishing schooners of about one hundred tons each. The same is true of Lunenburg, with eight vessels, and of Liverpool, Mahone, and Conquerall Bank, with five each to their credit. In a dozen or more places where only one or two vessels are being built scarcely any are under two hundred tons. Strangely enough, the revival has not yet spread to all the places formerly noted for shipbuilding. The south side of Minas Basin was once dotted with shipyards and swarming with shipwrights, but now, with scarcely an exception, the shipyards are silent and deserted, and the click of the caulker's mallet is no longer heard.

The revival of shipbuilding has not only greatly enlarged and increased the facilities for marketing our lumber, but is putting to profitable use an unbelievable quantity of raw material. Nobody unacquainted with the shipwright's art can form any adequate conception of the quantity of lumber of various kinds that must be used in building a ship. If such a one could see in one pile the timber required to build a vessel of any specified size he would be sure the pile contained enough material not only to build the ship, but to furnish a cargo for it after it was built. Some of the timber used is too crooked to make merchantable lumber and is worth little for any other purpose, but it becomes extremely valuable when used as part of a ship. To give it that value, however, it must be supplemented with a vast quantity of the best lumber the forest can supply, and the profitable disposal of that lumber is only one of the advantages afforded by the revival of shipbuilding.

War a Boon to Wooden Shipbuilding Industry

Mr. A. B. Mackay, of Hamilton, Ont., who was recently in Toronto, gave an interesting interview to the Globe, in which he spoke of the development of the shipbuilding industry in Eastern Canada. "The high price of steel," he said, "has been responsible for the return to the lakes of wooden sailing vessels, which had become almost obsolete when the modern steel craft made its appearance a few years back. Since the outbreak of the war the building of steel vessels for the merchant trade on the Great Lakes does not warrant the outlay of a large amount of money by shipowners. Consequently several marine transportation interests which contemplated adding to their fleets have hesitated about placing orders on that account."

At Meteghan, N.S., a four-masted schooner is being constructed for Mr. Mackay, which he expects to have launched about the middle of this month. On its maiden trip it will carry a cargo of lumber from Yarmouth, N.S., to Montevideo, South America, a distance of over 6,000 miles. The vessel is being constructed of hardwood frames and spruce planking, and will cost about $75,000, which is said to be the highest price ever paid for a vessel of this type in Canada. Mr. Mackay stated that he has already placed orders for six more schooners, at a cost of almost $500,000. The present cost of construction, he says, shows an increase of about 75 per cent, as compared with the cost fifteen years ago.

"The war has been responsible for unusual activity in the wooden shipbuilding industry in different parts of Nova Scotia," added Mr. Mackay. "Before the war many of the shipbuilding industries had practically gone out of business with the gradual disappearance from the lakes of the wooden vessel, the great bulk of which were built in the Maritime Provinces. At present there are between thirty-five and forty wooden sailing vessels under construction within a radius of ten miles, and there would be many more if labor was available. The most of these vessels are for transatlantic service."

Extensive Operations in Northwestern Ontario

Reports from Fort Frances, Ont., state that the Shevlin-Clarke Company now have seventeen camps in process of formation, which, when completed, will give employment to 2,000 men. These camps are scattered from Rainy Lake east to Atikokan. The report also states that the company will take out the largest cut of logs it has taken out for some years. Labor is scarce and wages are running from $30 to $40 per month and board. The company expect, however, that when threshing has been completed in the West the supply of labor will be more plentiful. Altogether between the Shevlin-Clarke Company and others there are expected to be some 2,700 men engaged in the woods east of Fort Frances this winter.

As the price of pulpwood has advanced, it is expected that at least 100,000 cords will be taken out in the above district this winter. There will probably also be about 1,000,000 ties, poles, and posts taken out in the same locality.

New Manager for Knight Brothers Company, Limited

J. H. Cole.

Mr. J. H. Cole, whose portrait we publish herewith, has resigned his position as secretary-treasurer of the Magnetawan Tanning and Electric Company, of Toronto and Burk's Falls, in order to take the position of manager for the Knight Brothers Company, Ltd., of Burk's Falls, Ont.

Mr. Cole was born in Georgetown, Ont., and educated there. He joined the staff of the Knight Brothers Company in 1899, acting for them as shipper and lumber inspector, and later as cost accountant, until the spring of 1904, when the company's plant was destroyed by fire. Then he took charge of the office of the Magnetawan Tanning and Electric Company at Burk's Falls. In 1908 he was transferred to the head office at Toronto and appointed secretary, both of that company and of Tobey, Ltd., whose tannery is located at Collingwood. With the exception of about six months spent in Cleveland, Tenn., he has been associated with the above companies only. Mr. Cole's experience has been sufficiently varied to give him a good idea of modern business methods, and we bespeak for him a successful career in the important position he is about to take. His duties with the Knight Brothers Company, Ltd., will commence about December 1st.

Will Prairie Trade Again Go to the United States?

Editor Canada Lumberman: Grand Forks, B.C., Nov. 4th.

The lumber industry of British Columbia is now in a prosperous condition. The former over-production has disappeared and the prospects point to a severe shortage of lumber during 1917.

A number of the mills will not operate next year for many different reasons. Several of the larger plants suffered largely by floods, while others are cut out of their available timber. Others are out of business owing to over-capitalization.

The farmer on the prairie, although having 25 per cent. less crop, is receiving about 75 per cent. more for it. All through the provinces of Manitoba, Saskatchewan and Alberta, the retailers have allowed their stocks to become depleted, hoping for a reduction in prices. The retailers all want to buy lumber, while the stock in the hands of the mountain lumbermen is sixty million feet less than this time last year, and in the hands of four of the largest mills.

The forests of the States and Eastern Canada are being rapidly depleted of their supplies, and when the war is over and times get normal there will not be sufficient lumber to take care of the orders that will flow in.

There are several lumbermen in Ontario who own timber and mills in British Columbia, lying idle. Some of them own very valuable timber and very accessible. It is quite possible that they are not in touch with the industry in British Columbia and do not understand that the opportune time to operate has arrived. If the British Columbia mills cannot supply the demand for lumber it will naturally drive the business to the mills in the United States, and especially to those lying along the borders of the prairie provinces. If the retailer is forced to buy his lumber in the United States this money will be lost to Canada forever. The provincial government has assisted and will assist in keeping the money within the province, and it is quite possible that, if the true state of affairs were known to the Ontario lumbermen, they would decide to operate and assist in keeping the market for British Columbia and the money in Canada.

Needless to say, the mills now operating to any extent, from a selfish point of view, are not pointing out the above facts.—W. Mark De Cew, President and Manager, Western Pine Lumber Company, Limited.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the supervistor of cullers, Quebec, P.Q., under date of November 6th:

	1914—Cu. ft.	1915—Cu. ft.	1916—Cu. ft.
Waney white pine	593,080	397,280	143,400
Red pine	1,040	.....	.....
Oak	343,240	110,120	336,240
Elm	305,240	46,840	72,160
Ash	680	840	1,680
Butternut	.....	.....	40
Birch and maple	50,800	48,880	46,880

From the Canada Lumberman of Thirty-five Years Ago

A New Lumber Industry: A correspondent, writing from British Columbia, includes in a recent letter some interesting information in regard to the lumber and logging business of the province. The point from which he writes is New Westminster, located at the mouth of the Fraser River, and very near the boundary line between that province and Washington Territory. It is the largest manufacturing point for lumber in British Columbia, and will, no doubt, become the centre of one of the most important producing districts on the Pacific before many years. The country adjacent to it is rapidly settling up, and we are informed that the business of turning the timber wealth of the country into cash already occupies a large proportion of the people. The forests are the continuation of those immense timber tracts that have made Oregon and Washington Territory famous, and the trees contained in them are similar in size and other respects to those found there. Speaking of the remarkable size that the timber attains, this correspondent says: As the trees in the woods through which we passed, on the Hastings Road, were such monsters, I was curious to know how they could be cut down and hauled about. Miles upon miles of timber exists on the inlet, of the Douglas fir species, as well as cedar. Unless one saw these trees he would scarcely credit the fact that such did exist anywhere. In numerous instances they rise a perfectly limbless trunk for 200 feet, and then over another 100 feet above that with small limbs.

About three miles from Granville I saw trees felled that were 320 feet in length and 8 feet in diameter. There were hundreds like these all round. The woodman cuts a hole in the tree, about four feet from the ground, into which he inserts a board having sharp iron prongs. This resembles a springboard. On this he stands while swinging his axe. The axe is the same as is used in the East, but much longer in the handle, generally four feet; occasionally a shorter one is used for the outside cuts. As he enters the tree the resin runs like water, and every blow spatters it in every direction. So soon as the tree is down the woodman attacks another. His business is to lay it on the ground. Following him come the sawyers, who cut it into the required lengths; then the "barkers." Every inch of bark is peeled off before leaving the spot where it fell, to enable it to be moved round conveniently by the teams. In this camp an ox team of twelve oxen is employed to bring the logs to the road on which the traction engine runs. Strong pulleys, with endless chains, are used to get the log so the team can get a haul on it. Come away it must. Scarcely a word is uttered to these dumb brutes. The driver is merciful on the score of shouting, and uses a goad. He stands in the middle of the team, has a long pole, in the end of which is inserted short spikes. A few dabs of this into the hide of the bullock has the desired effect, and off they go, pulling all together for dear life as it were. They take to the "station ground," on an average, logs that will manufacture into 8,000 feet of lumber. The road on which the traction engine runs is constructed of split cedar, and hewed down perfectly level. In the centre of this roadbed, at distances of seven feet apart, are placed concave blocks of maple, on which the logs can ride. As they move along the "greaser" applies dog-fish oil to each one. The log being free of its bark, the oil takes effect, and along it glides, apparently with perfect ease. The engine makes four trips a day to and from the water, into which the logs are rolled, and thence are towed to the mill by a tug. Following the logs to the mill, we saw them hauled up the gangway and placed upon the carriage; two circular saws in very short order take off the slab, one saw being suspended and revolving over the other. The lumber cut is taken on board a vessel lying at the wharf, loading for Hong Kong.

British Columbia Forest Scale for September

The timber returns for the month of September, issued by the Forest Branch, show the total scale of sawlogs for the province to be 105,795,387 feet B.M., in addition to 423,412 lineal feet of poles and piling, and 23,551 cords of ties, shingle bolts, posts, etc. The returns according to forest districts are as follows: Vancouver, 73,556,121 ft. sawlogs, 144,275 lineal ft. poles, etc., and 16,755 cords of bolts, ties, etc.; Cranbrook, 13,086,889 ft. sawlogs, 40,962 lineal ft. poles, etc., and 3,351 cords of shingle bolts, etc.; Island, 11,461,412 ft. sawlogs, 3,080 lineal ft. poles, etc., and 465 cords of bolts, etc.; Vernon, 4,948,294 ft. sawlogs; Prince Rupert, 1,750,219 ft. sawlogs, 24,567 lineal ft. poles, etc., and 1,687 cords of shingle bolts, etc.; Nelson, 758,355 ft. sawlogs, 87,545 lineal ft. poles, etc., and 1,082 cords of bolts, etc.; Hazelton, 135,097 ft. sawlogs and 94,776 lineal ft. of poles and piles; Fort George, 99,000 ft. sawlogs; Kamloops, 20,250 lineal ft. poles and piles; and Lillooet, 7,957 lineal ft. poles and piles. Timber sales recorded during the month of September cover an estimated total of 9,444,224 ft. sawlogs, 37,100 lineal ft. of poles and mine timber, 3,550 cords of shingle bolts and cordwood, and 6,000 ties, estimated to produce revenue amounting to $21,334.

Plants of Vancouver Lumber Co., Ltd.

Fir Mill at Vancouver and Cedar Mill at Roche Point—Splendid Equipment for Handling Export, Local and Eastern Canada Trade

Mr. Chas. Plant, Toronto.

The recent opening of an office in Toronto by the Vancouver Lumber Company, Ltd., in order to take care of their trade in Eastern Canada was an event of much interest to the lumber trade, both in the East and in the West, and is an indication of the fact that the market for British Columbia lumber products in Eastern Canada, which has been more or less spotty in the past, has developed of late into one of sufficient extent and variety to warrant the special attention of British Columbia manufacturers.

We have drawn considerable attention to the increasing interest taken by the trade of Eastern Canada in the lumber products of the Pacific Coast, and we are pleased to have an opportunity in the present issue of giving our Eastern readers some idea of the facilities for production and shipment of lumber enjoyed by the Vancouver Lumber Company, Limited. Two large mills are operated by this company, the chief one being known as the Vancouver Lumber Company's fir mill, which is located on False Creek in the city of Vancouver. The other mill, at Roche Point, on Burrard Inlet, known as the cedar mill, is operated by a subsidiary company, under the name of the Vancouver Cedar Mills, Limited.

The fir mill has a sawing capacity of 200,000 feet in ten hours, its principal equipment furnished by Canadian Allis-Chalmers, Limited, being one double cutting and one single cutting bandsaw, two resaws, edgers, automatic air trimmers, etc.

A Stetson Ross timber sizing machine is located at the end of the sawmill in a wing, and beyond this wing are the skids to which the timbers are conveyed by travelling chains and rolls. From the skids the timbers are loaded on to cars or barges for export abroad. The sizing machine will dress timbers up to 20 in. x 30 in., and the longest length handled is 94 feet.

The filing room of the sawmill is located on the top floor and machine shops are on the ground floor.

The log pond in False Creek is a large one, and easily carries sufficient logs for such extensive operations as are carried on at this plant.

The power plant consists of an Allis-Chalmers 24 in. x 36 in. twin steam engine, a turbo-generator, Allis-Chalmers-Parsons type, of 750 kw. capacity, using the exhaust steam from the twin engine, and the usual auxiliary engines. The company also has its own electric lighting plant, which supplies current for illuminating the offices and mills. The boilers are fired with sawdust. The surplus edgings and trimmings are conveyed to a large burner, erected by the Muskegon Boiler Works, Muskegon, Mich. This burner is of the double core, water-cooled type.

In connection with the sawmill, the company operate seven "North Coast" dry kilns, with a capacity of 20,000 feet per kiln. At one end of the dry kiln is located a covered shed for cooling, sorting, and regrading the kiln-dried lumber, preparatory to its use in the planing mill or being stored in the main dry sheds, of which there are four, with a capacity of 1,000,000 feet each.

Flooring, ceiling, siding, and all kinds of mouldings are manufactured in the planing mill, located a short distance from the sawmill. The equipment of the planing mill consists of one American, four Woods, one Stetson-Ross, and two Berlin fast-feed matchers and two Woods stickers or moulding machines. The most important piece of equipment in the planing mill is the cedar bevel siding machine. This is a combination resaw and sizer, with a capacity of a carload or 60,000 feet of bevelled siding per day. All the machines in the planing mill are equipped with automatic feed tables; and the entire planing mill is driven by electric motors, which obtain their current from the central power plant.

The loading platform runs parallel with the planing mill and the dressed lumber shed. Two railroad sidings are operated, one running to the sawmill for the loading of timbers and the other running to the planing mill for loading finished lumber and yard stock. These are connected with the British Columbia Electric Railway, which affords connection with every railway running out of Vancouver. The company is thus enabled to make shipment to any point.

Cedar Mill at Roche Point.

The cedar mill operated by the Vancouver Cedar Mills, Ltd., is located at Roche Point, on the north shore of Burrard Inlet, about seven miles from Vancouver, and is one of the best equipped plants in British Columbia for the production of cedar lumber and shingles. It is on a site of about 17 acres, and has over 1,400 feet of water frontage. This site was originally acquired by the Red Fir Lumber Company, Ltd., who erected a substantial mill frame and large hotel building, which were subsequently taken over by the Vancouver Lumber Company, Ltd. Then the mill was remodelled in accordance with the most modern manufacturing ideas. This plant has two log intakes, the main intake looking after the logs that are suitable for manufacturing into cedar siding and other cedar lumber, the other intake being direct into the shingle mill. Shingle blocks are produced from logs entering both intakes, and are conveyed by travelling chains to the shingle mill, where they are cut into suitable sizes for the shingle machines, twelve in number, all upright, made by the Sumner Machine Works. Each of these machines has a capacity of 30,000 shingles per ten hours, and a chute beneath each machine conveys the shingles to the graders on the floor below. There the shingles are graded and packed and the bundles are conveyed by gravity rolls to the entrance to the three shingle dry kilns. When the shingles come out of the dry kilns they are put through a repressing machine, which tightens and blocks the bundles into a neat and symmetrical appearance. Then they are carried by gravity rolls to the water front and loaded in railroad cars on a barge. The lumber from the cedar sawmill is also conveyed to the barges by gravity rolls, and the barges are shipped to the fir plant at Vancouver. There the cedar lumber is manufactured in the planing mill into cedar bevel siding, etc. With the facilities and equipment now supplied by the company it is able to make shipment of its products in mixed or straight carloads, as may be desired by its customers.

The outstanding feature of the cedar plant is the extensive use made of transmission systems and gravity carriers. Wherever possible, the handling of stock is done mechanically, with the result that the operating force required does not exceed 85 men when every department is in operation at full capacity. The equipment of the cedar sawmill consists of log haul, log stop, Simonson turner, overhead

canter, three block carriages with 72 in. opening, one 9 in. single cutting band mill, 10 x 32 direct steam-driven Wickes gang, 8 in. x 60 in. edger, 24 ft. overhead trimmer and slasher, with air lift for saws, and a very complete outfit of live rolls, transfers, etc. In the main line of rolls from the bandsaw and directly opposite the back edger table is loctaed a steam gang lifter for throwing the shingle cants from the live rolls to the transfer chains, which carry them to other live rolls for delivery to the cut-off machine. This machine carries a 60 in. circular saw, for cutting off the cants to the proper lengths for shingles. The filing equipment is located on the third floor, directly over the band mill. The main part of the cedar mill is 46 ft. wide and 152 ft. long. A wing on one side contains the gang cut-off machine, and is 32 ft. wide by 64 ft. long. The engine room is located on this side of the mill, in a wing 32 ft. wide and 32 ft. long. The engine is 18 in. x 24 in. Sumner twin slide valve engine, with balanced valves. It rests on solid concrete foundation, and has ample power for driving the mill at its fullest capacity. On the opposite side of the mill in a wing 24 ft. wide by 30 ft. long is located the lath equipment, consisting of lath bolter, lath machine, lath trimmer, transfers, and conveyers.

Shingle Mill Equipment.

The shingle mill equipment is located in a separate two-storey building adjacent to the north end of the lumber department. This building is 42 ft. x 150 ft. long, and is of heavy timber construction, substantially supported on concrete piers. The shingle blocks are conveyed to this plant by an endless chain from the cant cut-off machine in the sawmill, and by another conveyer from the log cut-up mill.

The shingle dry kilns are located to the west of the mill, a sufficient distance away to afford protection from fire, and are three in number, each being 20 ft. wide and 120 ft. long. They are fireproof, being of hollow tile and cement construction. After the shingles pass through the kiln they enter the cooling shed, where they remain a sufficient length of time to cool gradually. Then they are passed into the storage shed, still in the original load and on the same trucks on which they entered the kilns. This shed is 64 ft. wide and 108 ft. long, and has a capacity of several million shingles.

The steam plant for supplying steam to the engine dry kilns is located in a separate building north of the sawmill and east of the shingle mill. This building is 52 ft. wide and 82 ft. long, and is of heavy timber construction, with crib walls and substantial concrete piers. The steam plant consists of five high-pressure, double-butt strap horizontal tubular boilers, each 72 in. in diameter and 18 ft. long. Three of these boilers are set in one battery and two in another. The battery of three boilers is connected with an induced draft system of the Miller type, and the other battery has natural draft, with stack located outside the building. The boilers are furnished with Dutch oven furnaces, automatically fed with mill refuse by a conveyer from the sawmill. The battery of three boilers is for the sawmill and the battery of two boilers is for the shingle mill, but they are all piped together with the required valves between, allowing either of the departments to operate independently.

The refuse from the entire plant is conveyed a sufficient distance away to avoid all risk, and is consumed in an open fire, the dump being protected by a wire mesh screen 30 in. in height.

The capacity of the cedar plant is about 100,000 feet of lumber and 350,000 shingles in ten hours. It will be readily realized by the trade

in Eastern Canada that with this large output and the output of the fir plant at Vancouver the company are in an excellent position for taking care of the requirements of the Eastern trade, either in straight or mixed car loads.

The timber limits of the Vancouver Lumber Company, Ltd., are mostly located on the mainland and islands, about 100 to 150 miles north of Vancouver. About half are held under old-time leases and the balance are licenses, and the timber on them is conceded to be of the best quality in British Columbia.

The chief markets of the company in the past have been on the Canadian prairies. They have also developed an extensive trade, however, in the United States and in parcel and cargo shipments by water to various markets across seas, as well as a local trade at Vancouver and other British Columbia points. Their extension into the Eastern Canadian trade is a logical development of their successful policy of expansion.

One of the best-known products of the Vancouver Cedar Mills, Ltd., is the "Big Chief" brand of shingles, which are manufactured on upright machines, specially designed for the production of a vertical grain shingle, and produced from the finest quality of cedar grown in the world. These shingles are among the finest that can be found upon any market. The "Big Chief" shingles are 16 in. long, 5 butts to 2 in., and each bundle measures full 10 in. in thickness when dried. They are 100 per cent. clear, 100 per cent. heart, and have 100 per cent. covering efficiency. They contain no sap, and are of random widths, but none less than 3 in. wide. The company are also among the few manufacturers in British Columbia who are authorized to manufacture and sell the "Rite-Grade" shingles, which are now being so extensively advertised. Besides these special brands, the company manufacture

Interior view of Vancouver Lumber Company's shingle mill, Roche Point, Burrard Inlet, B. C.

all the other grades of 5 to 2 (5 x) and 6 to 2 (3 x) shingles that have justly established British Columbia shingles as the best in the world.

The Vancouver Lumber Company, Limited, have their general offices at Vancouver and branch offices in the Excelsior Life Building, Toronto; at 343 South Dearborn Street, Chicago, and at 709 Great West Permanent Building, Winnipeg, Man. The officers of the company are as follows: J. E. Tucker, president, Lon Beach, Cal.; A. L. Clark, vice-president, Dallas, Texas; E. C. Knight, secretary and treasurer; E. S. Sanders, manager; Liggett N. Thompson, sales manager. Mr. Charles Plant is their representative in Eastern Canada, and has charge of their office at 701 Excelsior Life Building, Toronto.

Insurance on Standing Timber

Risks on standing timber against loss by fire have not been considered a profitable line of business by insurance companies in the past. A few exceptions could be mentioned in cases where specially fine risks have been insured, but as a practically general rule there has been no development of this line of insurance business. During the present year, however, policies have been written by the Phoenix Insurance Company of London, England, upon standing timber in Oregon and Washington, with certain restrictions, the rates varying from 1 to 1½ per cent. Risks are taken only upon timber that is accessible to markets and not unduly exposed to fire hazard, and only one risk is taken in each fire zone, or area indicated by the company. No risk is taken for a greater amount than $17,500 in any one such area.

W. R. Brown, in an article on this subject in "American Forestry," goes into some detail in discussing its possibilities. He summarizes the fire experiences within the territory of various fire prevention associations, and his figures include the 22,000,000 acres under the supervision of E. C. Allen in the twelve Western private fire prevention associations which he supervises; the New Hampshire Timberland Owners' Association, with 1,000,000 acres; the Northern Fire Protective Association of Michigan, with 2,000,000 acres; the St. Maurice Valley Fire Protective Association of Quebec, with an area of 8,000,000 acres—the total of four associations being 33,000,000 acres. The expenditure for forest ranging and fire prevention is approximately 1 cent an acre for the first three and ¼ cent an acre for the Canadian organization. In the Western associations the fire loss for the year 1910 was one-half of 1 per cent. In each association since that time it has been much less than that figure, except for 1914 in the Canadian association, when one fire got away and the fire loss of the year was three-fourths of 1 per cent. upon the timber valuation. Taking all four areas together and summarizing the figures for each which Mr. Allen gives, the average yearly losses respectively were as follows: 1910, .005; 1911, .000171; 1912, .0002328; 1913, .0012636; 1914, .00253; 1915, .00427.

The writer concludes from these figures that in such protective areas fire isurance should cost for the loss ratio not over one-half per cent. annually, with another one-half per cent. added for administration cost of the insurance plan. He gives some further experience upon which to base this conclusion. In Minnesota during the last ten years, with its forest wealth of $280,000,000, the average fire loss has been about $100,000, or one-thirty-fourth of 1 per cent. annually.

Fire the Greatest Enemy of the Forests

Mr. Elwood Wilson, superintendent of the forestry division of the Laurentide Pulp and Paper Company, Ltd., Grand Mere, P.Q., appeared before the Dominion Royal Commission in one of its recent sittings at Montreal and expressed the opinion that the next twenty-five years would see the disappearance of the wood pulp supply in Canada unless conservation measures were adopted. He stated that three things were essential, namely: The adoption of a scientific scheme of reforestation; a proper system of fire protection, such as that in use in British Columbia and on the lands under the control of the Laurentide Company; and a system that would do away with the dangerous disposal of waste now prevailing throughout Canadian forests. During the past thirty five years, he said, 30 per cent. of the pulpwood lands of Canada had been burned over and rendered useless for generations to come.

At the same session of the commission Mr. Carl Riordon, managing director of the Riordon Pulp and Paper Company, Ltd., stated that the long haul to Europe and the consequent high freight rates made it almost impossible for Canadian paper and pulp manufacturers to compete with the manufacturers of pulp in Europe, located chiefly in Sweden and Norway. He expected, however, that when the war was over, the higher taxes prevailing in Europe, the higher cost of production, and the higher cost of capital would increase the price of European pulp materially, and enable Canadian manufacturers to develop these markets more successfully.

Mr. R. H. Campbell, Director of Forestry for the Dominion Government, stated that the annual loss by forest fires in Canada might be placed conservatively at an average of $5,000,000. He considered that fire prevention was of greater importance at present than afforestation.

Transportation of Big Logs by Flumes

Economies Secured and Efficiency Promoted as Compared with Railroad Logging—Quantity of Water Required Remarkably Small.

By W. D. Starbird*

The advantages offered by the use of flumes in the transportation of logs are becoming better known and more appreciated by loggers all over the country as they have greater opportunities to familiarize themselves with their operation and observe the satisfactory results that are invariably being obtained with them.

The first flume ever constructed for the exclusive purpose of transporting logs and long timber, so far as I am informed, was that built for the Milwaukee Land Company, on Rochet Creek, Idaho, some six years ago. It proved a success beyond expectations, and demonstrated the value of this means for making accessable timber that could not be taken out at a practicable cost by any other method now in use. Since its construction several other flumes have been built at various points in the Inland Empire and British Columbia. The owners and operators of all are well pleased with the results they are getting, and wherever one has been used new friends and enthusiasts for the logging flume are being made.

In a paper read at a meeting of this organization shortly after the flume for the Milwaukee Land Company was completed I endeavored to give, in a general way, some idea of the many advantages of flumes in the transportation of logs and described in considerable detail their engineering, design, and construction. Since then I have written several other articles, all of which have been given publicity through the columns of the lumber journals. In all of these papers I have tried to convey some idea of the many important advantages to be obtained by the use of flumes in connection with logging operations and how readily they may be adapted to almost every condition and requirement of log transportation whenever there is an available supply of water to draw from and a descending grade.

It is with special reference to the question of water supply that I will deal in this paper. I have repeatedly stated in other articles written on this same general subject that much less water is required in the successful transporting of logs through a flume than is generally understood. I am confident that flumes as a means of transportation are being overlooked or discarded in connection with many difficult logging chances on account of lack of information or misinformation on this very important point, when their use would convert an unprofitable operation into a money-maker.

Flume Transportation for Large Logs.

This is no doubt especially true with reference to the handling of large logs here on the coast. Many loggers operating in coast timber probably assume, without investigation, that a flume is not practical for handling their timber on account of its large diameter and the length of logs cut. Knowing that a flume must be of large size to carry such timber, it is mistakenly concluded that an extremely large volume of water is also required. This is not a fact, however. The successful fluming of any log in a triangular flume box only requires sufficient water to slightly more than fill the space underneath it, when resting on the sides of the flume.

For example, take a log six feet in diameter. To flume such a log will require a flume box having sides 72 in. high, measured along their surface, setting at an angle of 45 degrees from perpendicular. To float it the flume must be completely filled with water.

Water is commonly measured in cubic second feet, which is the number of cubic feet flowing past a given point in one second. The velocity at which it will flow depends on volume as well as grade. The quantity of water necessary to fill completely a triangular flume box, with sides 72 in. high, would, if the flow is unobstructed, have a velocity of about 16.75 feet per second on a 1 per cent. grade, and the volume would be about 300 cubic second feet. Such a large volume of water would not be available in many instances, where the conditions in all other respects would be favorable for a flume, and its use advantageous.

It has been fully demonstrated, however, that no such large amount of water is necessary for successfully operating such a flume in transporting a log six feet in diameter. When a log of this diameter lies in a triangular flume box, supported by its walls, on a 1 per cent grade, the space under it will only allow 11.33 cubic second feet of water to pass through. The log will operate as a dam to hold and accumulate in the flume all the flow of water in excess of this quantity until a sufficient head to float it is raised. This head will continue to be held with the log as it is carried forward, except for a small wastage underneath, due to its not moving as rapidly as the water.

Effect of Velocity and Momentum.

As the grades get steeper, logs will attain a constantly increasing velocity and momentum, which will add to their buoyancy to such an extent that a much smaller quantity of water, in proportion, will be required to keep them in motion. For this reason the amount of water that will carry logs over a 5 per cent. grade will usually be found sufficient on all steeper grades, unless they are being loaded into the flume on a heavier grade than 5 per cent., in which event more water will be necessary. Double the quantity of water that will pass under a log of the largest diameter to be handled, on the steepest grade up to 5 per cent. over which the logs are to be shipped in the flume, will be found ample for satisfactory fluming, and ordinarily one and one-half times what will pass under the log will be sufficient.

Therefore, the fluming of a log six feet in diameter over a 1 per cent. grade will require 11.33 cubic second feet of water, plus 5.67, one-half of that amount, making a total of 17 cubic second feet, or at most 22.66 cubic second feet, which is double the quantity that will pass under it when lying in the flume. This is only a little more than one-twentieth in the first instance and one-fourteenth in the latter of what is required to fill the flume full when the flow is unobstructed

by logs. To flume the same size of log over all the varying grades from the flattest to the steepest that are practicable will require, at the most, about 50 cubic second feet of water, that amount being double he quantity required on a 5 per cent. grade to fill the space in the flume under a log of the size specified. This is not a very large stream of water, but it will suffice for the purpose of fluming these logs, as well as 300 cubic second feet, except for a little loss in shipping capacity, on account of the slower movement of the logs.

To give a more comprehensive idea of how small a stream this amount of water will make, it will fill a triangular flume box, on a 5 per cent. grade, to a height of slightly over 27 inches, measuring along the surface of its walls. To fill a 72 in. box on a 5 per cent. grade will require 673.74 cubic second feet of water. Note the difference between this amount and what is actually required for successful fluming.

To flume logs eight feet in diameter will require a triangular box 96 in. to 100 in. high, measured along its surface, and on a 2 per cent. grade, taking double the quantity that will pass under it, 70.5 cubic second feet of water, having a flow of about 15 feet per second and 54,000 feet per hour. On a 5 per cent. or steeper grade 112 cubic second feet of water will be required, figuring on the same basis, and its velocity will be, on the 5 per cent. grade, about 24 feet per second and 86,400 feet per hour. On a 2 per cent. grade its velocity will be about 17 feet per second and 61,200 feet per hour.

Great Carrying Capacity of a Flume.

An important factor in connection with the water supply required in fluming logs is the great carrying capacity of a flume, which makes it possible to transport a large quantity of timber in a comparatively short space of time. The larger the timber to be handled the greater this capacity becomes in proportion. Logs might be shipped end to end, if they could be gotten into a flume that fast. Generally speaking, logs are and should be loaded into a flume and started where the grades are flat. This applies to shipping from ponds, rolling in, chuting in, and every other means of getting them started in the flume. If necessary, the grade should be flattened at landing places.

As an illustrtaion to show the extraordinary capacity of a flume, take, for example, one built for carrying logs up to six feet in diameter, over varying grades from 1 per cent. to anywhere above 5 per cent. Let us assume that logs are going to be shipped from ponds and rollways along the line of the flume, where grades will average 2 per cent., which should be a fair average grade from which to start shipments in a flume.

In computing the shipping capacity of a flume we must take the velocity of the water on the flattest grade over which the logs are to be flumed, assumed in this case to be 2 per cent., and to carry them over the steeper grades we must have, say, double the quantity of water required to fill the space under the log on a 5 per cent. grade, which for a 72 in. log has previously been shown to be 50 cubic second feet. The unobstructed flow of this volume of water on a 2 per cent. grade will be approximately 14.8 feet per second and 49,680 feet per hour. Therefore, if logs could be placed in the flume, end to end, and they traveled at the same speed as the water, 49,680 lineal feet, or 1,552 pieces of an average length of 32 feet, could be shipped per hour. After making a liberal allowance for all retarding influences at least one log 32 feet in length could be shipped for each 100 feet of the flow of water in the flume, or 496 pieces per hour, if they could be started at that rate. It is, however, usually impracticable to get logs into a flume that fast, especially logs as long as 32 feet and over in length. Consequently the shipping capacity of a flume is limited to the number of logs it is possible to get into it, and not by the number it will carry.

The number of logs that can be loaded into a flume will depend on the method used. If shipping from a pond, there should be nothing to prevent starting two or three long logs, or as many as five or six short ones per minute, and under any circumstances it should be perfectly safe to assume that one log of an average length of 32 feet can be shipped every minute, or 60 per hour. This would allow 828 feet of water flow to each log placed in the flume, and a space of about 796 feet between logs, which would be unnecessarily slow shipping, as far as the flume is concerned, and should be doubled at least, especially if the water supply is limited. Reports from several flumes now in operation handling short logs state that five to six pieces per minute are being shipped.

Average Scale of Fir Logs.

Logs 32 feet in length, averaging from 10 in. to 72 in. in diameter, would scale, according to the Columbia River Official Log Scale, slightly more than 3,000 feet to the piece, but I am informed that the common run of Columbia River fir logs will scale on an average of from 1,000 to 2,000 feet to the piece. This would give a fluming capacity, in board feet, of from 60,000 to 120,000 per hour, if no more than one log per minute were shipped. Even at that rate, a flume will have such a large carrying capacity that it will transport the entire daily output from almost any logging operation, in from one to two hours. Therefore, a continuous available flow of water supply, equal in volume to from one-twenty-fourth to one-twelfth of what is required while shipping will be all that is necessary for a successful flume proposition, if this supply is held in storage while the flume is not in operation.

In this way, by using storage ponds, a stream of water the continuous flow of which is about four cubic second feet, will be sufficient to supply a fluming head for two hours out of each twenty-four, that will transport at least 120 logs up to six feet in diameter, averaging 32 feet in length and amounting to from 120,000 to 240,000 feet board measure, and 9 1/3 cubic second feet will handle the same number of logs of equal length up to eight feet in diameter. This is allowing a continuous flow, during shipping hours, equal in volume to the requirements, as previously shown, for fluming the logs of the largest diameter specified in each instance. If the extra large logs are sorted out and shipped separately, a much smaller supply of water will give an equal shipping capacity.

Storage ponds can usually be provided in connection with any flume proposition by building a dam at or near the head of the flume, where the required capacity can be secured. Ordinarily some suitable location for such a dam can be found where it can be constructed at a nominal cost, and where it will answer the combined purpose of storing both water and logs.

When for any reason this method of conserving the available water supply is not feasible or practicable, even greater shipping capacity and better results may be obtained from a more limited water supply by the use of a chain of automatically operating locks.

Since it has been fully demonstrated that logs can be successfully shipped through a triangular flume box by a head of water accumulated with the log operating as a dam, when the continuous flow is greater than what is required to fill the space under it, in the flume, it must follow that any other effective means for accumulating the necessary head will operate in a like manner.

Adaptability of Lock System.

When locks are used for this purpose they would consist of a number of small storage tanks or reservoirs, built into the continuous line of the flume at intervals, the frequency of which will depend on

View showing water banked around a large log, being flumed on a one per cent. grade—Crow's Nest Pass Lumber Co.'s Flume– near Wardner, B.C

View showing a very low head of water on a five per cent. rade—Boom sticks and piling that were successfully flumed with it

the amount of water available in proportion to the size of the logs to be shipped and the gradient on which they are to be operated. Their size and the length of each unit would be determined by the same controlling factors. They would be built along the same general lines as an ordinary box flume having a flat bottom and perpendicular side walls, and should be kept on or close to the ground, in order that they may be utilized as landing places in shipping logs. Any size of box, from six feet wide by four feet high to twelve or more feet in width by six or more feet in height, as may be required, will be practicable and can be used. Their length should be at least three times that of the longest log to be handled, and may be as much longer, as the conditions seem to demand.

They should be built on a very flat grade, regardless of how steep the grade may be along the line of the flume, in connection with which they are installed. The different units will be joined together by intervening sections of triangular flume box, the size and construction of which will be equal to the requirements for logs of the maximum diameter to be handled and uniform with that of the balance of the complete line.

These sections will be given enough gradient to take up and compensate for the flat grades of the locks, and may be as steep as are practicable on any other part of a flume line. At the lower or forward end of each lock its bottom will be gradually tapered in to a point and the walls flared outward to a connection with the triangular box, in a manner that will avoid any sharp angles. The connecting triangular flume box will be given a gradually increasing gradient from where it leaves this lock until the maximum necessary to bring it on a level with the next succeeding lock is reached. This gradient will be maintained to a point where it can gradually be flattened again and the triangular box brought to a junction with the lock on a level and gradient uniform with that of the lock. A square end in the lock will be all that is required for joining the two together, which will be done by framing the triangular box into the square end, keeping the top of both on the same level. A gate will be placed where the triangular flume commences at the lower end of the lock, so designed that it can be easily and quickly raised entirely out of the way or lowered into place.

Locks for Rollways.

Each of these locks constitutes a small storage reservoir, and provides the most economical means of getting logs into the flume. If properly built, in proportion to the requirements, logs may be safely rolled into them from skidways provided alongside, and the cost of their construction need not greatly exceed that of any other part of the flume in connection with which they are used. Any number of them at more or less frequent intervals along the line of the flume may be utilized as required, either for loading in logs or accumulating a shipping head of water.

In the operation of a flume provided with a chain of such locks the procedure would be to lower the gate in the one from which shipping is to be commenced. As soon as it fills with water from the supply, assumed to be continuously flowing through the flume, logs will be rolled in, up to its holding capacity, the gate raised, and fluming out of the logs started. As fast as more space for logs is provided in the lock they will be rolled in, and the operation of rolling in and fluming out continued until the head of water is reduced below what is necessary for these purposes, when the gate will be closed until a new head is accumulated.

The gates in all the succeeding locks below the one from which shipping is done will be kept open, as each lock will operate automatically in accumulating a head and discharging it with the logs passing through. This will be accomplished by the water rushing in with and in advance of the logs from above faster than it can discharge through the narrowed mouth at the lower end, the gradient of which is flat and so constructed and arranged that it will operate in a similar manner to the neck of a bottle, only allowing to pass through the quantity of water required to carry the logs of the largest diameter it was designed for handling.

Cost of Locks or Reservoirs.

In considering the cost of locks or reservoirs such as have been described, it must be taken into account that they are a part of the continuous flume line, and each lineal foot of their length replaces that much triangular flume. Therefore, the difference between what it costs to construct a foot of triangular flume and the cost per foot of the locks will be their only actual cost in relation to the complete line. This additional cost will result from the greater amount of material required more than from extra labor, and should not amount to more than $1 to $1.50 per lineal foot, depending on their size. Their length would be from 80 to perhaps an extreme of 200 feet, and two or three per mile of flume would be the limit required. On this basis it would add from $160 to $900 per mile to the cost of the complete line of flume. The cost of a single storage dam might easily exceed their cost in connection with a flume several miles long. It is, of course, impossible to make any definite figures along this line because of the widely differing conditions that may control each separate installation.

In connection with this subject some information and data on the cost of flumes and their operation will probably be of interest. So far as I know, there has not yet been a flume built for handling logs as large as eight or even six feet in diameter, and therefore, no definite figures can be given regarding the cost of constructing or operating them. Taking, however, the actual detailed cost of flumes built for handling logs up to five feet in diameter as a basis for figuring, the estimated cost of engineering and constructing one for handling logs six feet in diameter will be from $8,000 to $10,000 per mile, and that of one for eight foot logs $10,000 to $12,000 per mile.

The cost per thousand feet for handling logs through a flume, including the cost of maintenance, varies according to the volume of shipping and the length of the flume. Reports from several flumes that have been in use for two or more years show that it does not exceed 25 cents per thousand at most, and may be reduced to 12½ cents, or even less when very large quantities of timber are flumed.

Advantages and Availability of Flumes.

There are several features regarding the availability, advantages, and economy of flumes in the transportation of logs that stand out prominently:

1. Their feasibility, wherever there is a water supply and descending grades.
2. The small amount of water actually necessary for their operation.
3. Their adaptability to almost any conditions.
4. Their extraordinary capacity, even when the available water supply is extremely limited.
5. The low cost of maintenance and operation, and, in conclusion, the cost of constructing a flume when built to handle small timber, is much less than that of a railroad, and when built to handle timber of the largest size will not exceed and seldom equals that of a railroad, constructed under similar conditions. The cost of steel and railroad equipment is high and getting higher, while the only cost of the lumber in a flume will be that of logging and sawing, plus the stumpage value of the timber used.

The cost of transporting logs by flume is much less than by railroad. To operate a railroad requires experienced, expert labor, frequently hard to secure and not always dependable. In the operation of a flume no skilled labor is required, and, in fact, very little of any kind, all of which would seem worthy of careful consideration when choosing a means for log transportation.

Canada's Foreign Trade in Wood Goods.

Canada's exports of forest products during the twelve months ending September were as follows: 1916, $53,952,950; 1915, $47,241,070; 1914, $42,191,112.

During the twelve months ending July the imports into Canada included wood and manufactures of wood to the following values: From the, United States, $9,251,617; from the United Kingdom $171,320; total, $9,650,358. During the corresponding period of 1915 the total was $9,986,244.

Exports of wood and manufactures of wood during the twelve months ending July were as follows:

	Twelve months ended July.			
		1916.		
Articles exported.	1915.	Total.	To U.K.	To U.S.
Logs	$1,134,282	$ 996,342	$ 65,448	$ 930,554
Lumber—Deals, pine	1,107,941	1,673,182	1,613,471	35,391
Spruce and other	7,716,382	9,832,764	8,649,532	330,351
Laths, palings and pickets	2,074,066	2,380,327	17,559	2,352,577

Wood blocks for pulp	6,397,389	6,254,717	.....	6.254.717
Wood-pulp	9,205,359	12,931,681	939,525	11,246,765
Wood and manufactures of—Total	$54,004,776	$68,630,154	$16,382,454	$48,272,588

An order-in-council has been passed by the Dominion Government granting a drawback of 99 per cent. of customs duties paid on materials used in the original construction of ships measuring over 500 tons gross tonnage, built in Canada, to be exported for outside registry. The vessels must be constructed so as to obtain a registry in Lloyds satisfactory to the Minister of Customs, and their export upon completion must, in each case, be authorized by order-in-council. Quite a number of vessels on foreign order are now being built in Canada, but in each case arrangements have to be made with the Government for permission to export. Under the general regulations of the War Measures Act the export of vessels to non-British countries is prohibitive, but the Government has power to permit exportation in all cases where conditions warrant.

Are you prepared to supply the inevitable demand of your customers for British Columbia Structural and Finish Lumber, Shingles, Doors and Furniture?

ROOMS

WHERE do we spend most of our lives?

BETWEEN the four walls, floor and ceiling of ROOMS.

DO the nature and appearance of these SIX sides of a room have any influence on our lives?

UNQUESTIONABLY, since they constitute our principal environment from childhood to old age.

WHAT qualities is it desirable the sides of a room should possess?

A FLOOR which you like to walk on. WALLS which form friendly surroundings. A CEILING which is not a monotonous expanse. DOORS and FIXED FURNITURE which are a combination of utility and beauty. THE WHOLE of harmonious, restful colors and agreeable texture, dustless, and easy to keep clean and polished. A PLACE you enjoy being in.

DO YOU KNOW of any material which so completely answers all these requirements as WOOD?

Can anything equal a well laid WOOD FLOOR?

Is there any material which is more permanently satisfying for WALLS than WOOD PANELS?

What can surpass WOOD for a beamed CEILING?

Has any material ever been found which can give the same degree of satisfaction for DOORS and FURNITURE as WOOD?

WOOD possesses a vitality, has a softness and warmth of color and texture which makes it THE MATERIAL to LIVE with. WOOD is strong, durable, tenacious, dustless, sanitary, and easy to keep clean and polished.

A ROOM FINISHED IN WOOD IS HEALTHFUL, COMFORTABLE, COMPANIONABLE, SERVICEABLE, ATTRACTIVE and HOMELIKE

BRITISH COLUMBIA'S forests supply a number of woods, such as **DOUGLAS FIR, WESTERN SOFT PINE, WESTERN RED CEDAR,** and **WESTERN LARCH,** which for finish work are of superior merit, and their **cheapness places wood finish** within the **reach** of **every home builder.** As an architect, or as a dealer or worker in Building Materials, you will want to inform yourself in regard to these woods, which within ten years will dominate the lumber markets of the world.

Equipment new and most modern, including circular log cut-off, power splitter and knee-bolter, also bolt cut-off. Ample power; dry-kiln capacity for night shift. Good bolt supply. Apply Owners, Box 478, Canada Lumberman, Toronto, Ont. 22-22

Valuable Box Factory For Sale

The undersigned will receive offers for the purchase of that valuable property known as the CZERWINSKI BOX FACTORY, situated on Logan Avenue and Tecumseh Street, Winnipeg, Canada. This property comprises what is believed to be the finest box factory in Western Canada, fully equipped with the latest and best machinery for box manufacturing and ready for immediate operation. It also includes the factory site, consisting of about 2½ acres of land close in to the business centre of the city, and possesses unexcelled trackage facilities. Street cars pass the factory door. This is a magnificent opportunity for any person wishing to engage in box manufacturing. The whole may be purchased at a very great bargain.

Further information may be obtained upon application to H. E. DENEEN, Assignee of the Czerwinski Box Company, Limited, 300 Electric Railway Chambers, Winnipeg, Man. 22-t.f.

For Sale

Twenty acres Elm and Basswood, also 40 acres of Virgin Cedar near station. S. A. Price, 71 Lakeview Avenue, Toronto, Ont. 20-23

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, crosscut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.

Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

Miscellaneous

For Sale

One hundred square miles of Pine and Spruce limits well situated on the St. Maurice River, on which at least 400,000,000 feet of lumber will be found. Price $350,000, payable $150,000 cash and the balance in four annual payments, with interest at 6 per cent. For full particulars apply to La Cie des Bois du Nord, 71a St. James Street, Montreal. 21-21

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of December next for the right to cut pulpwood and pine timber on a certain area situated on the Pic River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet, board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for twenty-five thousand dollars ($25,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $25,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.
Toronto, August 28th, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 18-22

Sleighs For Sale

Twenty-five sets logging sleighs, in good condition. The Peterborough Lumber Company, Limited, Peterborough, Ont. 20-1

Teams Wanted

We want to hire six or eight teams for winter haul, with or without teamsters. Work to commence about January 10th, 1917. Write Box 392, Huntsville, Ont. 21-22

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

AUCTION SALE
of
Timber Limits, Mill Property, Etc.

The undersigned will sell by Public auction, on Thursday, the 30th of November, 1916, at the offices of Wm. A. Cole, Auctioneer Hope Chambers, 63 Sparks Street, Ottawa, the following well equipped mill, also timber limits situate at Matts Bay, 31 Mile Lake, about 70 miles from Ottawa.

Limit No. 59, River Gatineau, 3 sq. miles.
Limit No. 483, Grand Lake, Gatineau, 40 square miles.

more or less, under government licenses. These limits contain Basswood, Spruce, Balsam, Pine, Hemlock, Cedar, Red and White Birch, etc., roughly estimated about 24,000,000 feet lumber and 100,000 cords pulpwood.

Plant consists of Waterous 8 ft. Improved Double Cut Band Mill, Jenckes Engine and 2 Boilers, Alligator Boats, Logging Gear, Waggons, Sleighs, Harness, etc., Camping Outfit, Dwellings, etc.

Plant has only been in use some three years and is in condition to start operations at once.

Terms cash. Sale at 10.30 a.m.

For further particulars apply to

A. W. STEVENSON, C. A.,
802 E. T. Bank Building,
22-22 Montreal, Que.

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of February, 1917, for the right to cut pulpwood and pine timber on a certain area situated on the Black Sturgeon River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure, for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for ten thousand dollars ($10,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $10,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Slump in German Woodworking Industry

A Berne correspondent of the Press Association states that Germany's great woodworking industry has suffered enormously through the war. At the end of 1915, in the first sixteen months of the war, no less than 8,300 factories and workshops had been closed out of a total of 20,900 existing before the war.

The home trade was worse than the foreign, since with the call to arms the creation of new homes and households practically ceased. Hence there was little demand for furniture or household utensils. The export trade, which was very great, has also suffered severely. Toys and pianos, and other musical instruments, to the value of nearly 200,000,000 marks, or 10,000,000 sterling, were sent abroad in 1913; last year's total is estimated at less than 25 per cent. of this sum. Unlike so many other industries, the woodworking factories have found little employment in the war. At first they were engaged in making baskets for munitions, and later other employment was discovered for them. One piano factory has been turning out barbed wire, and a furniture factory has been making shells, but for the most part the wood workers have been of little use in the munition field. Every week more factories are being shut down.

Review of Current Trade Conditions

Ontario.

Reports received from a number of lumber manufacturers in Northern Ontario show that the output of logs during the coming winter will be considerably reduced, the decrease varying from 25 per cent. to 50 per cent. at different points. The shortage of labor is the chief factor responsible for this situation. During the summer of 1916 the output at the mills has been considerably less than in former years, also as a result of the shortage of labor for operating the mills. Dry stocks are already becoming scarce in many parts of Ontario. Enquiries from Canadian points and from United States points indicate quite a revival in trade. Apparently retailers have commenced to feel anxious about their supplies, both for next year and for the next few months. Contracts are now being made for stocks at considerable advances over the prices that prevailed early in the fall. The volume of sales is much better than it was a year ago.

There has been a tendency on the part of hardwoods recently to lag in some respects. This can be definitely traced to the fact that in connection with the production of shell boxes the Imperial Munitions Board have been favoring the box with a veneer diaphragm rather than the box with the solid hardwood diaphragm. As the great majority of this veneer stock is imported from the United States, the local hardwood trade suffers to that extent. Otherwise, the hardwood trade has been reasonably good. Factories are busy, but the shortage of labor is a serious drawback, and is preventing many of them from producing at their full capacity. The United States demand for hardwoods is good, with a slight tendency to hold back during the past two or three weeks on account of a certain amount of hesitation caused by the presidential elections. Throughout the producing centres in Canada and the United States available stocks are low, and the same thing applies to yard stocks. The outlook, therefore, is that producers can count fairly definitely on a good demand for their output. The piano trade, the furniture trade, and the flooring trade are all active, and are consuming considerable quantities of stock. This is using up all the lower end and is rapidly eating a hole into the good stocks. A material shortage is reported in 1 in. and 1½ in. first and seconds birch in Canada. Other sizes and grades are also reduced in stock to some extent. With two months yet to go in the present year and any sort of an adequate car supply, the trade will undoubtedly find that their requirements of dry stock to carry them from the beginning of 1917 up to the next sawing season will be very inadequate. The demand for 2½ in. birch for rifle stocks in the United States continues quite strong, and the supply is pretty low. The shortage of foreign cars in Canada is hampering shipments to the other side, and, so far as producers are able to see, it looks as though the situation in this regard will be worse before it is better.

Eastern Canada.

Further advances are reported from St. John, N.B., in the price of deals for future delivery. The allied governments are taking this material for construction purposes in the war zone, and are paying good prices, as high as $30 per M. f.o.b. the wharf having been paid for long deals of good average widths. The demand is improving, and the mills are showing a greater inclination to sell rather than hold out for higher prices. All the mills in the St. John section are sawing English deals. Ocean freight rates are about 275s per standard. Stocks of deals at St. John are not heavy. Good prices for deals have resulted in many rotary mills operating in the woods, and these are getting from $3 to $3.50 per M. for sawing. The high cost of provisions and labor, however, are likely to keep down the profits on such operations. The New England market continues firm at a base price of $28, and it is expected that $30 will be reached before next spring. The spruce board market in New England and the market for cedar shingles are not so encouraging, prices being at best $17 per M. for boards 1 x 4 in. and up at the mills and $3.60 per M. for white cedar extra shingles delivery Boston. Some of the St. John mills will carry over good stocks of logs and others will have none at all. Logging operations are now in full swing.

Continued improvement is reported from Montreal, both in the wholesale and retail lines. Prices have been advancing, and are expected to show further increases, as the demand continues strong. Activity in the export trade has increased with the approaching end of the season. It is expected that the total exports this year will be equal to those of last year.

Boston reports state that buyers are more inclined to come into the market lately than they were a month ago. At the same time the volume of production has decreased greatly, and the result has been firmer quotations. Spruce frames are now steady at $28, according to Boston reports, and $29 is expected during November. Random dimension is also firmer, the range of prices, Boston deilveries, being as follows: 2 x 3, $22.50 to $23; 2 x 4, $23.50 to $24; 2 x 5, 2 x 6, and 2 x 7, $22 to $23; 2 x 8, $27 to $28; 2 x 10, $27.50 to $28; 2 x 12, $28.50 to $29. Spruce boards are said not to be quite so firm as frames, but some improvement is reported, prices being $21 for covering boards, 5 in. and up wide, 8 ft. and up long. Good makes of white cedar extras, according to Boston reports, are bringing $3.60, and fair white cedar extras $3.50. Quotations on clears are from $3.20 to $3.30. Lath are stronger at $4.35 to $4.50 for 1⅝ in. and $4.80 for 1½ in.

United States.

Business in the United States showed no signs of slowing up as a result of the presidential campaign. Now that the elections are over, we can look forward to even greater activity than there has been during the past few months. The reason for the failure of the elections to interfere with business was that the whole country had so much more to think about that was of importance. From all parts of the country reports are received of extraordinary activity, many plants having orders on hand that will keep them running to capacity during practically all of 1917.

In the lumber industry, as in every other line, the car shortage continues to cripple shipments. Even a reasonable percentage of the cars required is not being furnished by the railroads. Efforts are now being made by several of the larger railroad lines to increase their rolling stock. During October orders were placed for over 25,000 cars. More than 30,000 freight cars are now under negotiation. It is reported that the Union Pacific will soon place orders for cars that will require 15,000,000 feet of wood in their construction and that they will specify Douglas fir. In the Eastern States the erection of new industrial plants continues on an extensive scale, a great portion of them being of mill construction, requiring large quantities of heavy timber. Building conditions throughout the country are favorable, and a good demand is reported from all sections. Unquestionably there is an enormous demand for lumber throughout the United States, and, with sufficient transportation facilities, manufacturers and distributors of lumber would have no complaints to make.

The Southern pine trade has felt the car shortage greatly, because of the increased demand and strengthening prices. Many mills have closed their plants and others have withdrawn their output from the market. Still others are restricting the quantity of orders accepted. Retail yards in Southern pine-consuming territory are expecting a good fall and winter trade. There is a good demand for Southern pine timbers for export, and shipments have increased considerably. For the week ending October 28th the West Coast Lumbermen's Association members produced 69,527,740 feet, which is 11.33 per cent. below normal. Orders were 4.19 per cent. below normal production and 7.45 per cent. above actual production. Shipments were 20.99 per cent. below normal production and 10.90 per cent. below actual production. Orders exceeded shipments by 13,171,884 feet, or 17.53 per cent.

Hardwood manufacturers, both in the North and South, report a good demand for all their products and stiffer prices. They find, however, that because of the increasing cost of production the price advances do not yet represent an increased profit. A better demand is reported for thick stock in Northern hardwood, and the trade is finding difficulty in obtaining what it requires. Automobile factories, furniture factories, and vehicle factories are all buying extensively. The monthly stock report of the Hardwood Manufacturers' Association shows a large decrease in stocks of fire and second plain white oak, poplar, and the higher grades of chestnut. Hemlock is in good demand and prices are stiffer, but increased prices have not compensated for the higher cost of production as yet.

Great Britain.

Spruce values have risen considerably of late in Great Britain, especially for the deal sizes, and the prospects are for still further improvements. Eleven-inch spruce deals are worth anything from £30 upwards; 9 inch are quoted at from £27 10s to £29, and 7 inch at from £25 to £26. Merchants are already considering the possibility of prices returning to those of last spring. Unsold stocks are still fairly large in some districts, but it is expected that the end of the import season will soon have an effect upon this situation. There is still an extensive spot business in London, and there are practically no signs of it slackening off at present. Arrivals are up to the average and deliveries are well maintained. A hardening tendency continues in connection with values. Some sizes are confidently expected to run short before spring shipments arrive. This applies particularly to

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

deals, which are not any too plentiful even at present. The requirements of the army in connection with the operations in France and Belgium have been increasing, and are expected to do so during the progress of the great push. At Foy, Morgan & Company's recent auction sale, 3 x 8 and 3 x 7 inch unsorted Quebec spruce sold at £28 5s. Fifth quality 3 x 7 and 3 x 6 inch Quebec spruce brought £24. The way in which buyers are taking up stocks at the auction sales indicates that they are inclined to pay big prices for any goods that can be handled at once.

The spruce situation at Liverpool shows very little change. Higher prices are confidently expected in the near future. First cost prices are expected to be higher, and importers are recognizing the fact that Canadian manufacturers are sharing in the labor difficulty and higher costs that are affecting the situation in Great Britain. In regard to future business, shippers are apparently refusing to consider anything except advances upon spot values, claiming that higher prices are necessary to meet the increased freight rates that are expected, as less tonnage is likely to offer for lumber during the next few months. The Manchester market is rather quiet, on account chiefly of high prices, shortage of men, and absence of building activity. Prices show practically no change. Spruce is not so strong as it has been, the enquiries being very light.

At Glasgow the trade continues on rather a quiet basis. A little more enquiry is reported from shipbuilding sources, and it is expected that this will increase, as there are signs of activity in connection with the construction of mercantile vessels. There is a better enquiry for spruce, and prices are firm. Transactions are reported on a basis of £25 to £25 10s for scantling, £26 to £27 for 7 inch and 8 inch and £27 10s to £29 10 s for 9 inch and wider. Stocks of 11 inch deals are very light, and higher prices are being quoted.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade in Much Better Condition

St. John, N.B., Nov. 8.—(Special to the Canada Lumberman.)—During the last two weeks we have had further increases in the price of deals for future delivery. Seemingly the allied governments want certain supplies for building in the war zone, and are paying good prices. Of course, this is all war prices, and possibly is no criterion of a steady market. Nevertheless, the prices are being paid, one concern having sold long deals of good average widths as high as $30 per M., f.o.b. their wharves. The demand is increasing, and practically all the mills are disposed to sell rather than await higher prices, as it seems too long a risk. No mills in this section are sawing for the American market, all sawing English deals. Ocean freights range around 275 shillings, which is excessive, but not quite so high as in 1915 and the early winter of 1916. Stocks at St. John are not heavy in respect to deals from St. John mills. Many rotary mills are going in the woods this winter, as the prices being offered by the deal merchants are good and at first glance look profitable, but when the high price of provisions is taken into consideration, along with the extreme wages, many will be disapoointed when the spring of 1917 opens and they begin to figure where they stand. Portable mills are in great demand all over the country, prices for sawing ranging from $3 to $3.50 per M. This is much higher than paid previously.

It is to be hoped that the prices now prevailing, along with the demand, will remain steady and not fall off during the coming year. When one looks at the position of the operator it is hard to say that he is deserving of any other treatment than this. Prices in New England are still holding firm at a $28 base price, and it now looks as if a further increase would take place at any time. In fact, it is felt that by spring a base price of $30 will be reached, with a good demand. The only market which is not good through New England is the spruce board and cedar shingles. No fancy prices can be had for either article, and buyers need some coaxing to pay $17 per M. for boards at the mills, IXX and up, or $3.60 per M. for extra cedar shingles delivered Boston rate of freight.

The next month will see about all the mills at St. John idle, as the season is fast drawing to a close. Some of the mills will carry over a good stock of logs and others will have none. No doubt a large quantity of bank logs will be cut this winter, for which good prices are now being offered. With the extreme high prices being offered for both logs and lumber, it is no time to gamble, but it is far better to sell on a safe price.

During the last ten days an association of lumbermen from Eastern New England was formed and a meeting held at Bangor. All the largest and many smaller mills were represented, along with many log operators, and as soon as possible this association will be in full swing, and will no doubt fill a long-felt want, as for a long time it has been a cutthroat business from the manufacturers' standpoint. This association should be successful from the start.

Logging is now in full swing all over the river, and no doubt if we have a good winter and plenty of help the cut will be normal.

Pacific Coast States Report Increasing Orders

The weekly review of the lumber market, issued by the West Coast Lumbermen's Association of Seattle, Wash., under date of November 1st, says: Unshipped lumber orders for transcontinental rail delivery now exceed 9,000 carloads, according to the weekly trade barometer of the West Coast Lumbermen's Association. There has not been a time in recent years when unfilled orders have shown such an accumulation—not even in the severe car shortage of 1907. Last week, in the transcontinental trade, new business taken on amounted to 2,410 carloads, while shipments by rail only amounted to 1,529 carloads. Orders for future rail delivery exceeded rail shipments for the week by approximately 20,675,000 feet, or 35.34 per cent. As a result of the further tightening in rail shipping facilities curtailed production became more marked, 117 mills reporting the actual manufacture of 69,527,740 feet of lumber. That is computed as being 11.33 per cent. below normal.

Temporarily easier ocean tonnage conditions gave impetus to shipping at tide water mills, the week's figures showing the clearing of 10,628,671 feet in coastwise cargoes and 7,818,044 feet in overseas cargoes, making a total of 18,446,715 feet and establishing a record week for the year 1916. Export orders accepted during the week amounted to 6,352,000 feet, while California and Alaskan business fell off slightly, only totaling 3,921,705 feet. All cargo shipments for the week exceeded all cargo orders by 8,173,010 feet.

Montreal Trade Much Improved

Montreal, Nov. 8.—(Special to the Canada Lumberman.)—The improvement in the lumber market recently noted has been accentuated during the last fortnight, and wholesalers and retailers report a decidedly better trade. With the larger demand prices have stiffened, the pronounced scarcity of some lines being a material factor in the rise in values. The buying of lumber for shell boxes is a very important influence in the heavier purchases, and, as the Imperial Munitions Board have, it is reported, just received bids on tender forms sent out for a million more boxes—4.5 and Bethlehem boxes—the demand on this account means that business will continue brisk for some time. The general feeling is undoubtedly optimistic, and wholesalers who quite recently declared there was nothing doing now state that they are busy and that the enquiries are excellent. The furniture factories are full of orders, and, owing to the heavy enlistment for overseas, are unable to give prompt delivery—in fact, have had to refuse business.

The British Government have sent out enquiries for a very large number of shooks, in addition to those now being made in this country for the same account. The shooks are to be of spruce, and the dry lumber required totals 3,250,000 feet of 5/8 in. finished thickness, lumber dressed T. and G. ½ in., and 750,000 ft. ⅞ in. finished. The specifications are so strict that lumbermen declare it is impossible to fill them at the price offered for the shooks. Some go so far as to say that lumber of the description required cannot be obtained, and that it is not grown in this country. It might be possible to secure a certain amount by selecting portions of vast quantities of lumber, but this, of course, is commercially impracticable, especially in view of advancing prices and the disappearance of suitable dry lumber. The specifications were sent from England, and were, it is declared, drawn up in ignorance of the conditions which obtain here. It looks as if the specifications were made without enquiry as to the possibilities on this side, and the experience gained under the few orders for shooks previously placed here warrants the statement that there will be difficulty in placing further contracts unless the specifications are modified.

The British Government have appointed, in Montreal, an agent, who will have oversight of all imperial orders for lumber placed in Canada.

Last month's building permits are valued at $352,942, a decline of $140,344; for the ten months the total is $4,139,934, a decrease of $865,592.

Enquiries from the United States are very good and have lately

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

improved. Some spruce recently sold fetched the highest price received by the seller this year.

Complaints are made of the shortage of cars, particularly on the I.C.R., this naturally delaying trade.

As the end of the season approaches firms exporting to the United Kingdom are rushing their goods to the other side. More space has lately been available, with rates about stationary. The season has proved much better than at first seemed probable, and it looks as if the total shipment will not be behind that of the previous year. Some firms have done comparatively little, the high freights and poor markets, especially lately, having a restraining effect. On the other hand, it is known that some exporters will exceed their former total. The shipping by tramps has, to a certain extent, offset the limited amount of space on liners.

The position of the pulp market remains about the same. Sulphite is still buoyant, and is likely to remain so for a considerable period. Contracts have just been made for delivery next year at very high prices. There is a great scarcity in Europe, which will cause a strong demand on Canadian mills. Ground wood is very firm and scarce. Newsprint continues in great request, and, with the increasing consumption, prices will probably remain at a high level.

Timber Trade of the British Empire

Encouragement of Inter-Imperial Trade—The Tariff Problem—Co-operation Between Practical Man and Scientific Investigator

Under the auspices of the Timber Trade Federation of Great Britain, an excellent address was delivered recently by Prof. Percy Groom, M.A., D.Sc., F.L.S., at the London Chamber of Commerce, his subject being "The Empire's Timber Trade: Its Future and Technology." In his introduction Prof. Green referred to the need for co-operation between the practical man and the technical expert. Continuing, he said:

Great Britain has, I believe, awakened from her apathy. It is now realized that the real trade warfare is between nation and nation, not between employer and employe, nor even among trade rivals of the same country. It is recognized that each industry in the country should organize so as to defeat the foreign trade foe. To accomplish this, fundamental problems concerning the maximum production and adequate supply and transport, with the difficult associated questions of labor, will have to be solved.

In this organized trade warfare of the future several ideas are now more or less widely accepted:

1. That our industries shall be fostered and protected by some kind of tariff duty.

2. That the British Empire shall utilize its resources to the maximum possible. This implies on the one hand promotion of trade within the Empire, and may involve the tariff policy known as colonial preference.

Thirdly, and I wish to emphasize this as much as possible, whether or not tariff changes are introduced, there should be the closest application of scientific principles to industry.

Protection without increased rate of production is a premium conferred upon physical idleness; protection without improved organization and improved application of scientific principles is a premium placed upon a mental lethargy, and in either case protection acts as a narcotic.

In view of the impending changes of conditions of the timber trade the most thorough and complete organization of the timber and wood-consuming industries is a paramount necessity; for the complex problem has to be solved as to how the conditions of these industries are to be changed so as to promote national, and even imperial, interests without seriously disturbing the timber trade. It is obvious that every member of the timber trade in this country should be able to contribute his views and thus should become part of such an organization.

But what are the impending changes of conditions? These are not merely, on the one hand, changes as regards capital available or as regards demands for wood to repair damage done in the war and catch up arrears of work. The mental attitude of our nation and empire is a new one. There is little doubt that definite protective tariffs will be adopted. But, so far as timber is concerned, it is not a mere question of grading the tariffs as regards raw material or manufactured articles. The question will also arise as to the extent to which woods grown within the British Empire shall be given tariff preference. There is little doubt (in fact, I have none) that more than one country of the British Empire will ask for such preference as regards its woods and wooden products. Apart from recognizing the grand response made by the self-governing countries of the Empire in this war, the British nation is generally in favor of utilizing to the fullest the resources of the British Empire. The principle itself is already decided. The questions are the extent to which this principle can be applied to the timber trade, and, if accepted, the means by which it can best be applied. Is the Government, with such advice as it elects to take, to decide this matter as a whole or in detail Or will the timber trade take organized action and prepare its case and advice? Timber merchants have already had experience of the Government's conduct of timber affairs, and will know if they desire this long-lasting and revolutionary change to be dealt with in the same manner.

If the timber trade decide to take action the time seems to have arrived for determining how the facts are to be collected, and the case drawn up to represent the views of all the wood industries of the country.

If it were deemed advisable to form a general intelligence committee to perform this work, such a committee could also deal with the matter of ensuring the fullest co-operation between technical science and the wood industries.

These matters are outside the main subject of this address, because they are beyond the confines of technical science. Yet I venture to mention them because, if science is to be of the utmost service to an industry, it must be in touch with the industry as a whole. That implies organization of the latter.

Science and the Timber Trade.

Now arises the question, How can technical and scientific research aid the timber industry in this country and contribute to the fullest utilization of the timber resources of the Empire?

Here I would like to emphasize the fact that such research would be of commercial value, even if no change of tariff or policy were impending or accomplished.

In reference to the application of science to daily life or industry, one fact worthy of note is the frequent largeness of the commercial return or the great enhancement of value of the resulting product. This fact is illustrated by very varied applications of scientific discovery. For instance, scientific research stamped out Malta fever, and the mere commercial saving on the capitalized expenditure represents a business profit of 30,000 per cent. To take an example provided by Drs. O. Witt and Max Mueller, the value of wood under successive treatment rises as follows:

	£	s.	d.
Cubic metre of wood in forest, value, say..		3	0
Changed to mechanimal wood-pulp		7	6
Changed to chemical wood-pulp		15	0
Changed to paper	1	15	0
Changed to wood-pulp yarn	2	5	0
Changed to artificial silk	7	10	0

In order to gain some idea of the aid that technical science may render to the timber industry and to the promotion of use of the woods of the British Empire it is necessary to glance at our wood imports. In 1913 we imported:

Conifer wood (softwood) logs and sawn, nearly		£23,000,000
Conifer wood (pitwood)	"	4,500,000
Conifer wood (wood-pulp)	"	5,500,000
Oak logs, etc.	"	1,750,000
Additional hardwood	"	4,000,000
Manufactured wood of various kinds	"	4,500,000

or a total of over £43,000,000.

Of this £43,000,000 the country loses much by the inevitable wastage in cutting and preparing the wood. Research is needed in order that this waste material can be utilized to the best advantage.

Another part of the timber is lost by decay and premature destruction, for instance, in coal-pits and buildings. Research is needed to decrease this loss in the most economical manner. For increased preservation of timber involves national saving, but from the timber merchant's point of view tends to prevent the substitution of other material in place of wood.

Our Timber Imports.

A part of the gigantic expenditure on imported timber involves a loss to the British Empire, in that we are importing from foreign countries woods that could be economically replaced by others grown within our Empire.

The British Empire includes within its confines a larger amount and wider range of timbers than is possessed by any other state. Our timbers vary from the softwoods of Canada to jarrah, karri, and other eucalypts of Australia, teak, padouk, and satinwood of India, mahog-

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company,** of Easton, Md., after giving the "Morehead" system a thorough trial.
Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—
—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.
Save **fuel** by bringing the pure condensation directly back to the boilers HOT!
Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.
Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

Canadian Morehead Mfg. Company
WOODSTOCK, ONTARIO

War Time Opportunity

Canada has another big war opportunity. Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc. have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods. The cost of installing plant is small and you make a sure profit from waste material.

WRITE US FOR DETAILS

We have imported ninety per cent. of the Canadian Wood Pulp supplied to Europe since 1899.

Becker & Co.

anies and cedars of West Africa and Honduras, greenheart of Guiana, boxwood of South Africa, and hundreds of less known woods, many of which are valuable and obtainable in quantity. Research is wanted as to the properties and uses of these woods, especially the less known ones. Some will be found useful and valuable, but others often light in weight may be regarded for the moment as useless as timber. Though obtainable in quantity, they represent obstructions to the forester and to the timber dealer. Again there we come to the necessity for investigation of utilization of waste material.

The dominant fact in our imports of timber is the enormous item (more than £30,000,000 annually) represented by softwood. The great deficiency in the British Empire, and this country itself, is in the supply of cheap, readily accessible, coniferous timber. How, then, can we save as regards this item?

Afforestation will do something to fill this gap possibly forty years hence. By checking the decay of pitwood alone we should probably be able to save the import of £1,000,000 worth and a large sum similarly in buildings.

Can we find in our Empire substitutes for some of this coniferous wood? Outside the aid that Canada and Newfoundland can give us, the question may at first sight seem a foolish one, considering the proximity of our supplies of Baltic fir. But I will examine several items.

In 1913 we imported wood-pulp amounting in value to nearly £5,500,000. It may seem a startling statement to make that the world's policy in regard to wood-pulp is a wrong one, yet the statement is partially justified and will be true at least before long. The conversion of cheap coniferous wood capable of use as timber is wrong, because the world's supply of such is absolutely and relatively decreasing, while the consumption (apart from wood-pulp) is rising. For this reason alone only such wood should be used for pulp-making as is a bye-product in sylvicultural operation of growing full-sized timber or is a bye-product of the clearing of the country for agricultural purposes. But another consideration steps in. This material, soon destroyed after conversion into paper, should be grown where production is most rapid. Now, if a plant has sufficient water, its rate of production of material of plant substance, whether this be timber or not, is very greatly increased by every rise of temperature. For instance, one giant thick Malayan bamboo grows a yard in height every day, thus attaining its height of 120 feet in comparatively few days. The place of production of paper material is in the hot country, and particularly of that of cheap pulp should be the moist tropics. Research on the light tropical woods will provide suitable material. Time fails me to deal with the difficulties involved at present, apart from price and transport, and the fact that means must be found to utilize the waste, which is greater than in the case of the coniferous wood-pulp.

While on the subject of wood-pulp, one question appears to me to require answering. That is, why we allow wood-pulp to be imported into England from countries that actually import the wood from which it is prepared. The import of timber direct would give us the useful bye-products of the sulphite industry. A similar question arises in connection with the match industry, for I believe that Sweden imports much aspen from Russia and sends it here in the form of matches. Sweden in 1913 sent us more than £290,000 worth of matches. Among the soft light woods of the British tropics we can probably find some appropriate for match-making, our imports of matches being in 1913 about £500,000. Wood for making pulp must be cheap, whereas wood for making the best matches is costly, so that the exploitation of colonial wood for this purpose is a promisig proposition. Another costly coniferous wood for which a substitute is required is the pencil cedar. In this connection I may mention that the German Government, in its endeavor to promote the use of German colonial woods, compelled certain government departments to use pencils made with a pencil cedar from German East Africa. This is only one case of the general German policy to advertise and promote the use of its colonial woods.

Other examples of enquiries that might be instituted are the substitution of hardwoods for pit-props in deep coal mines or for paving blocks in certain kinds of streets. For instance, on reference to the latter the question arises, Why does the jarrah paving last so much better in Australia than in France or England? Can we improve our methods of paving so as to economically permit jarrah or other hardwoods produced in the Empire to be used more widely in preference to Baltic pine under certain types of traffic

In addition to all these investigations concerning the saving of imported softwood and its possible replacement by imperial-grown hardwoods, investigations and advertisement of the prospective uses of some of the less-known Canadian softwoods are desirable.

But, as a whole, the main question of supplies of cheap softwood can be solved only by afforestation.

Prof. Groom then devoted attention to a consideration of the different varieties of hardwoods secured from various parts of the Empire. In conclusion, he said:

Another important subject for investigation is that of the utilization of waste products, these being in the form of slabs, small fragments of wood, shavings, and sawdust. Those merely engaged in sawing and planing timber will know the resultant wastage; this wastage will be increased if the amount of raw timber imported is increased at the expense of prepared wood, and where the wood is further manipulated the waste products increase. To show the vastness of the amount thus lost, I may mention that I know one establishment which in normal times has an annual wastage representing timber of about £20,000. Now, in reality every so-called waste fragment of wood represents so much power by which we can do work, for so long as the wood can be dried by the sun it can be profitably employed to produce power to drive engines, either by use directly as fuel or by yielding gas and charcoal, or it can be utilized to produce light. These facts are also of significance in forest countries where coal has to be imported from far away. Waste wood can be utilized to produce or help in the production of substances used in the manufacture of explosives such as cordite, acetone; antiseptics such as creosote, carbolic acid, iodoform; solvents such as both common kinds of alcohol and acetone; food material in the form of grape sugar; celluloid and collodion, and artificial silk. It can be moulded in melted wood. Some of these processes are already adopted abroad, and even to some extent in England. Some, such as the manufacture of alcohol, require encouragement by modifications of the existing law. The chemical utilization of wood especially lends itself to co-operative efforts in large towns, and to the cases of unmarketable woods in the tropics where water is obtainable, and even sometimes in this country (for instance, in the case of oak-coppice). Although largely the matter is not one of investigation, for we have much knowledge on the subject, yet in some cases greatly improved methods and improved machinery will follow upon research.

The Wood-consuming Trades Interested.

Moreover, in large towns industries manufacturing small articles, such as boot heels, toys, and the like, could be established.

Any comprehensive scheme of research should include within its purview investigation of the problems concerning industries largely using wood. Such a dependent industry, for instance, is the manufacture of pianos. Pianos to the value of many thousands of pounds are annually imported into this country from Germany, those pianos ranging in quality from the cheapest to the best in existence. I have little doubt that with research conducted by the co-operation of piano makers with a physicist, a steel expert, and a timber technologist we should soon learn the secret of making pianos with the rich yet mellow tone that renders the best German pianos so famous. This is one of the numerous cases in which consultation among representatives of various wood-using industries would be of the greatest benefit, and such consultation may have far-reaching results owing to the close linking of industries. An interesting case I may mention is that of the African bass trade, which before the war was captured by Germany to such effect that, on the one hand, this bass attained a higher price than the superior Brazilian material, and, on the other hand, we import large quantities of bass-brooms from Germany, though the raw bass material is largely from our own colonies.

Laboratories and Workshops.

The question arises, How is this co-operation between the timber trade and dependent industries and technical science to be practically accomplished? How are the problems requiring solution to be formulated and solved?

The investigations require the services not merely of timber technologists, but also of engineers and chemists on the scientific side, and of practical workmen engaged in industry on the other side. They demand not merely laoratories, but also workshops.

As regards the financial aspect of the question, the Government has issued the now well-known White Paper, subsidizing scientific research bearing upon industry. Each industry has to formulate its problems.

An Imperial Timber Bureau.

As a scheme for discussion I might suggest the establishment of an imperial timber bureau, placed in London, and in connection with an institution having not merely a timber department, but well-staffed and equipped chemical, physical, and engineering and fuel departments, as well as workshops. The bureau would be in the closest touch with the various countries of the British Empire, and the timber and allied trades be available for supplying technical advice, conducting investigations, and diffusing information among the trades and professions dealing with wood.

Small works might have to be established, or experiments in existing works might be made with the permission and co-operation of their owners. The working of such a scheme in co-operation with the timber industry, and especially the Timber Trades Federation, would, I believe, lead to the vast increase in the exploitation of woods grown in the British Empire, to the establishment of neglected industries, to the decrease in the amount of waste, and decreased loss through decay.

On the last item alone the saving to the country should annually reach seven figures. The question is how far the timber industry will feel disposed to take advantage of the Government offer and how far it will co-operate in this practical yet technical scheme, whose importance is national and even imperial.

The Market That Will Survive the War

—establish trade with the United Kingdom NOW! The market, once established, will prove your greatest asset!! The demand for Canadian paper of every description—and ESPECIALLY NEWS PRINT—is greater than the supply!!! We are the Largest Paper Makers' Agents in Great Britain, and we are anxious to hear from Canadian Paper Manufacturers and Exporters desirous of MAINTAINING their output After the War.

McLennan's Lath Mill and Bolter

Utilize your unsaleable lumber with a lath mill.

This lath mill and bolter is designed along simple lines with bolted wooden frame, making it inexpensive and substantial.

Capacity 45,000.

Specifications; Lath machine pulley 7 inches diameter x 9 inches face.

Floor space 7 feet 6 inches x 3 feet 6 inches.

We make gang edgers, shingle machines, sleeper machines and barkers, etc.

A Chart for Quickly Determining Belt Slip

We often read about "per cent. of belt slip," without knowing exactly what we are reading about. Now, belt slip is something very definite—so definite that it can be measured with a rule and a watch, and the purpose of this chart is to simplify the effort connected with measuring belt slip.

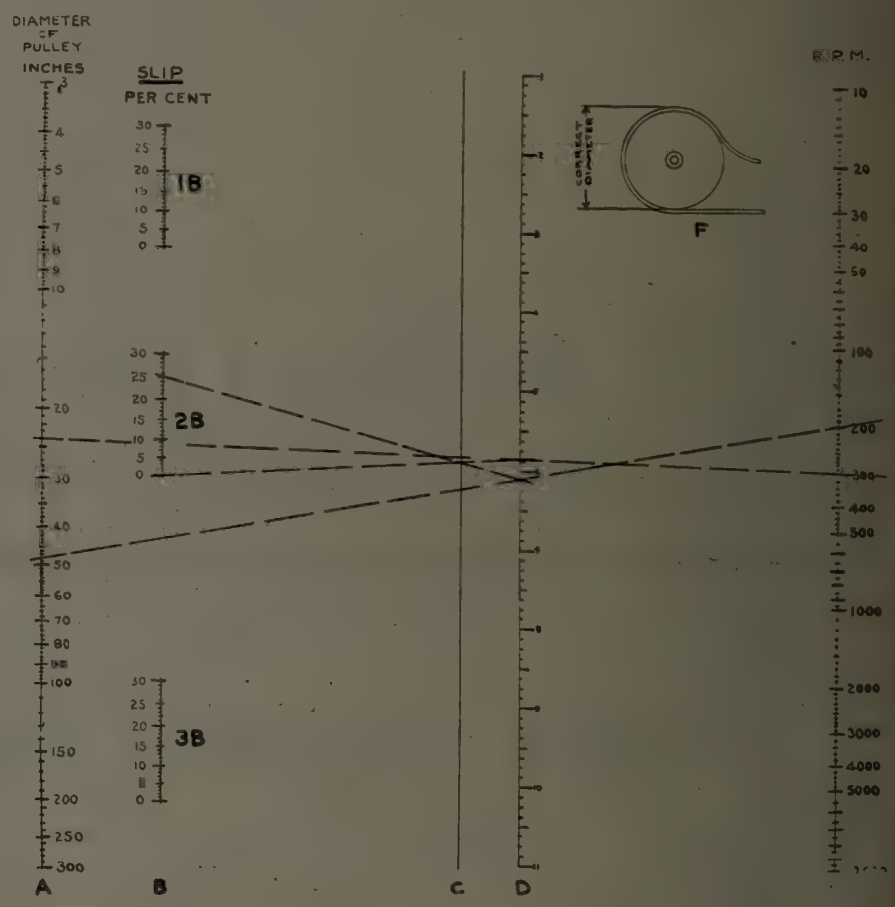
If you want the formula on which the chart is based, this is it:

$$\text{Per cent. of slip} = \left(1 - \frac{d\,n}{D\,N}\right)$$

Where d = diameter of driven pulley in inches;
n = r.p.m. of driven pulley;
D = diameter of driving pulley in inches;
N = r.p.m. of driving pulley.

In the first place, sketch "F" on the chart shows the correct way to increase the diameter of a pulley when a belt is on it. It is the same as measuring from "middle to middle" of belt so far as the result is concerned, but, more convenient.

Unless the belt thickness is considered you may sometimes get some surprising results, and you may say that "there is no such



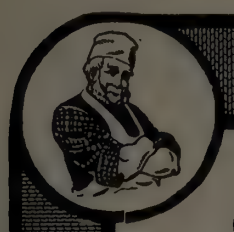
thing" as slip in your belt, and you may condemn this chart as being a "false alarm." So make measurements accurately if you want accurate results.

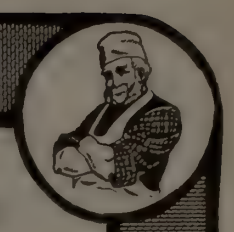
The best way to explain the chart is to give an example, so we will take this exaggerated case: The diameter of a driving pulley is 48 inches, and it runs at a speed of 200 r.p.m. (note the dotted line drawn from 48, column A, to column E, and note where it intersects column D. The point of intersection with column D is what we are after). Next, the diameter of the driven pulley is 24 inches, and it runs at a measured speed of 300 r.p.m. (Note, again, the dotted line between these two points and the intersection between 5 and 6 in column D. This point of intersection is what we want).

Roughly, each little space in Column D represents 14 per cent. of belt slip. Since the two points we have located are about two spaces apart the total belt slip is, roughly, 28 per cent. Actually, according to the above formula, the slip is 25 per cent. To get the exact slip on the chart without doing any computing, draw a line from the "upper point" to "0" of either "1B," "2B," or "3B." I have chosen "2B" be cause it is closest to the points of intersection. Note the point of intersection of this latter line with column C, and through that point of intersection and the "lower point" in column D the last straight line is drawn, and it will be found to cut "2B" at 25. The slip, therefore, is 25 per cent.

I have chosen an exaggerated case for the sake of simplicity. A little experience with the chart and you can tell closely "with your eye" whether or not there is any serious slip, remembering that each space in column "O" represents about 14 per cent. slip, a half space 7 per cent. slip, etc.

If the two main lines between columns A and E intersect at the same point in column D, there is no slip. In this example, if we





GOOD FLOUR FOR YOUR CAMP

The best economy in the world is to buy that commodity which, being good, is the cheapest value on the market. This simply means, when choosing flour, don't be altogether influenced by price, but get a wholesome, nourishing, uniform product that will bake up into appetizing food. That is why we recommend for your camp

Cream of the West Flour

The Hard Wheat Flour that is guaranteed for Bread

For years this flour has been held up as an excellent example of the "pure food" idea, and we are jealous in guarding that reputation. Your men will readily respond to your efforts in giving them good food with more work and cheerful dispositions, which means a big money saving to you.

Our horse feed is distinctly good. Bullrush Crushed Oats (best grade Western oats) and Geneva Feed (crushed oats and cracked corn) are both worthy of attention for your stable.

The Jenckes Machine Co., Limited

Sherbrooke Montreal Cobalt So. Porcupine St. Catharines Toronto Vancouver Nelson

remove all belt slip the driven pulley will run at a speed of 400 r.p.m., the lines between columns A and E will both intersect the same point in column D, and "1B," "2B," and "3B" become useless, of course.

In using this chart you don't have to really "draw lines," at all. Just lay a straight edge across or stretch a fine thread across and note the points of intersection.

It will be noted that the range of the chart is very wide; from 3-inch pulley diameter to 300 inches, and from 10 r.p.m. to 10,000 r.p.m. It therefore will easily cover all ordinary cases.

Widely Known Lumber Trade Journalist Passes Away

J. D. Crary, founder, publisher and managing director of the New York Lumber Trade Journal, and one of the founders of the New York Lumber Trade Association thirty years ago, and its secretary, died on November 1st, at his residence, in Brooklyn, N.Y., after a long illness. The late Mr. Crary was a man of signal ability, and left the impress of his personality upon the lumber trade, with which he was closely associated almost throughout his whole life.

Who Knows About This?

Prince Rupert, B.C.

Editor Canada Lumberman:—

We would like to know if there is a book of any description published for the purpose of estimating the amount of lumber used in boxes of various sizes. If you can give us the name of the publishers we will greatly appreciate it.—Georgetown Saw Mill Co., Ltd.

Are the Forests Worth Protecting

As long as Pacific Coast lumbermen are willing to sell these great yellow fir trees, that took 400 years to grow, for $9 at the mill, I don't see why we should bother to prevent forest fires. . . . The retail price of fir lumber in Australia is $56 a thousand. A difference of $2 a thousand here at the mill they would not notice or bother to change their retail price for. The only change they ever made in their retail prices is to advance or lower them $6 a thousand.—H. R. MacMillan, before the Western Forestry and Conservation Association.

Lumber companies operating in the woods of Northern Minnesota are preparing for one of the most active seasons in the history of that territory. It is expected that approximately 500,000,000 feet of lumber will be cut this fall by nine lumber companies, who will employ more than 10,000 lumberjacks.

Great Britain's Imports of Wood Goods

Imports into the United Kingdom during the nine months ending September, 1915 and 1916, included the following:

	1915.		1916.

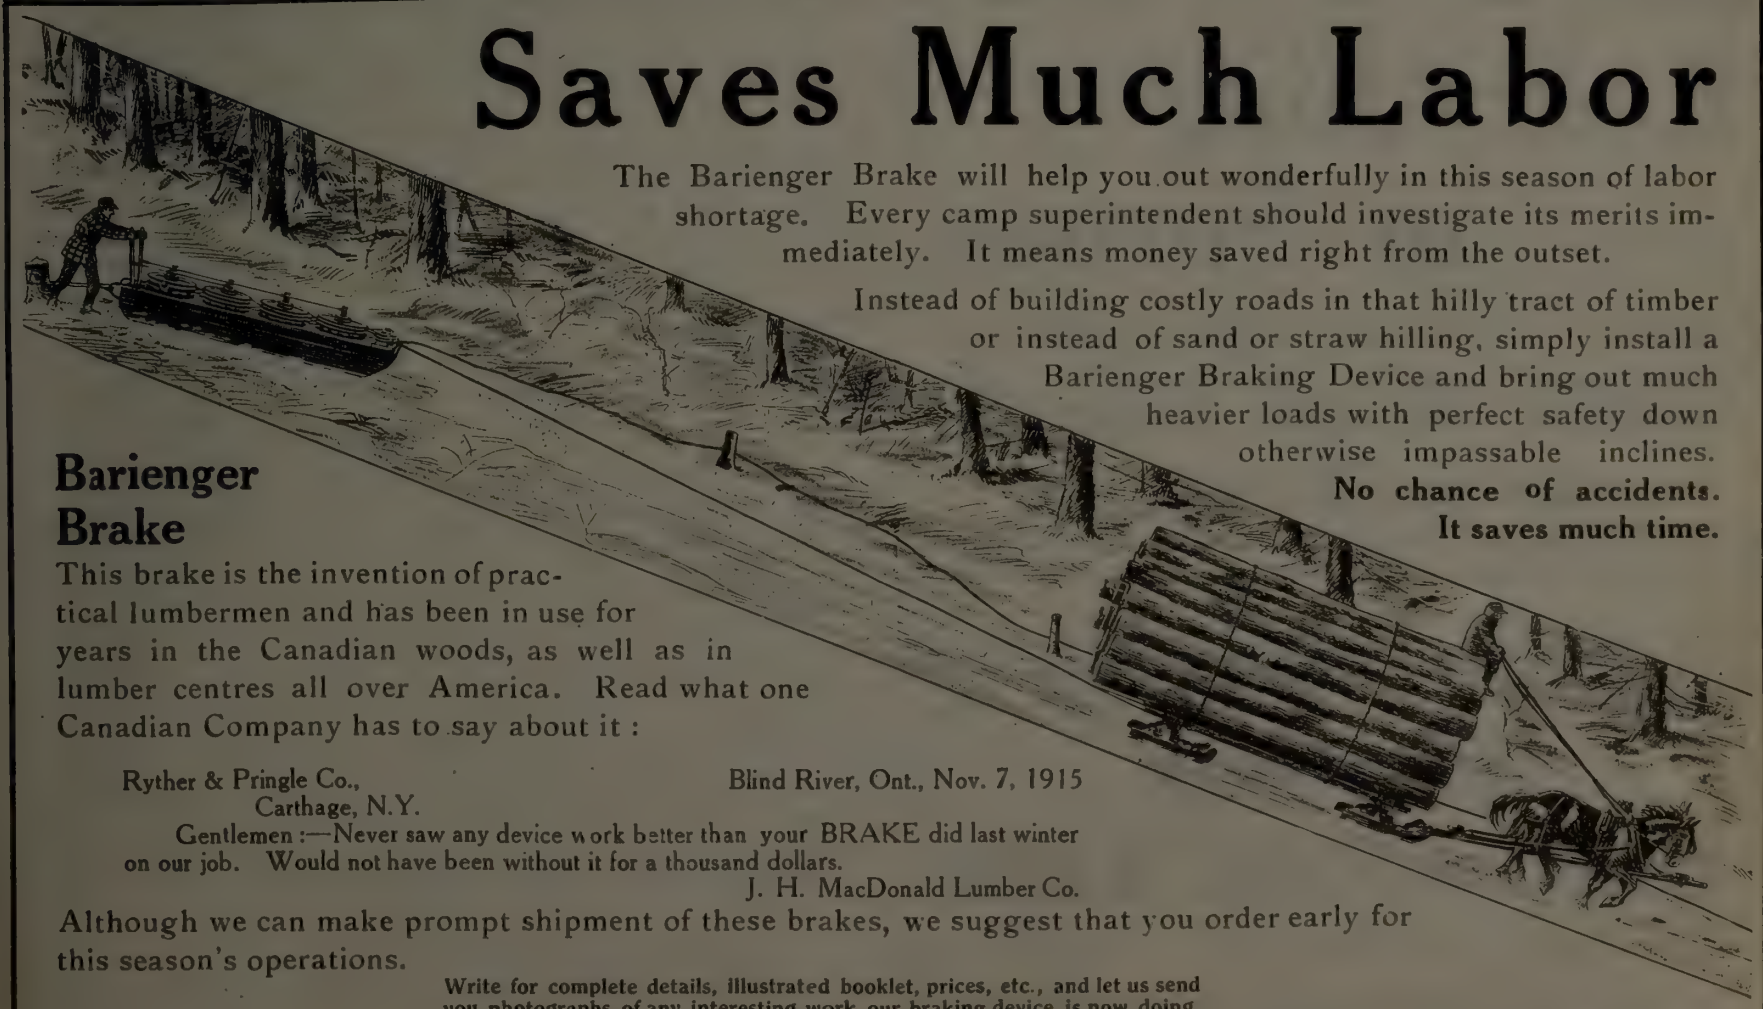
Saves Much Labor



The Barienger Brake will help you out wonderfully in this season of labor shortage. Every camp superintendent should investigate its merits immediately. It means money saved right from the outset.

Instead of building costly roads in that hilly tract of timber or instead of sand or straw hilling, simply install a Barienger Braking Device and bring out much heavier loads with perfect safety down otherwise impassable inclines.

No chance of accidents.

It saves much time.

Barienger Brake

This brake is the invention of practical lumbermen and has been in use for years in the Canadian woods, as well as in lumber centres all over America. Read what one Canadian Company has to say about it :

Ryther & Pringle Co., Carthage, N.Y.

Blind River, Ont., Nov. 7, 1915

Gentlemen :—Never saw any device work better than your BRAKE did last winter on our job. Would not have been without it for a thousand dollars.

J. H. MacDonald Lumber Co.

Although we can make prompt shipment of these brakes, we suggest that you order early for this season's operations.

Write for complete details, illustrated booklet, prices, etc., and let us send you photographs of any interesting work our braking device is now doing.

EDGINGS

Ontario

The Hendun Lumber Company, Ltd., has obtained a charter, with head office at Timmins, Ont.

Work has started on the erection of a planing mill for Hector McLean Orillia, Ont. The building will be one storey, 50 x 90, frame construction, brick boiler house. The owner will be in the market for engine, boiler, and planing mill equipment.

Reports from Port Arthur, Ont., state that a large wood pulp mill will be erected there in the near future. It is stated that the plant will have a capacity of 150 tons of wood pulp per day, in three units of 50 tons each, and that the cost of the plant will be $1,000,000. It will be located in the north end of the city, at Bare Point, where the municipality has given the company 100 acres of land. A large paper mill will be added at a later date.

Heavy rains have resulted in raising the level of the Ottawa River to such an extent that the two pulp mills at the J. R. Booth plant, which were closed down some time ago because of low water, are running again and giving employment to about 800 men. The rain has also swelled the Gatineau River, and thousands of logs which were stranded on sandbars are passing down to the Gilmour and Hughson mills, which have been reopened.

Dominion Hardwoods. Ltd., manufacturers of hardwood specialties, Deseronto, Ont., who recently lost their plant by fire are building a complete factory for the manufacture of broom handles, pail handles, tie plugs, fish boxes, and fish floats. The plant will be modern in every respect, equipped with the latest machinery, and will be in operation about the end of November. The building and equipment has cost between $50,000 and $60,000. The broom handle plant will have a capacity of from 35,000 to 40,000 handles per day. The pail handle plant will have a capacity of 100,000 handles per day. The company are very favorably situated in regard to timber, having an assured supply from option and otherwise for twenty years.

An agreement has been signed by the Ontario Government granting to Mr. J. A. McAndrew, of Toronto, the right to cut timber from 180 square miles of unoccupied lands in the Townships of Hanna, Reaume, Mann, St. John, and Aurora, in the District of Temiskaming, upon condition that large mills be erected within the territory for the manufacture and treatment of timber and wood and wood products, giving employment to 100 hands. The lease of this area was decided upon by the Government early in 1914, when tenders were invited, but Mr. McAndrew's tender was not approved until October 14, 1916. A joint stock company will be incorporated, with subscribed capital of $500,000, to erect the mills. Exclusive of sawmills, the expenditure upon woodworking plants must be $100,000, according to the agreement, and the daily output of these plants shall be the product of 75,000 cords of wood. The lease is for 21 years. It is likely that the plant will be erected in Cochrane or at a point on the Frederickhouse River. A rossing plant will also be erected for the treatment of pulpwood. Articles to be manufactured will include box shooks, cigar boxes, laths, broom and pick handles, wooden spools, doors and sash, and all wood accessories. Plans for the woodworking plant are now being prepared.

Eastern Canada

The reorganization of the Brompton Falls Pulp and Paper Company has been completed.

The Bury Pulpwood and Lumber Company, Hereford, P.Q., have been registered. Those interested are S. E. Watts and T. H. Van Dyke.

George A. Chappell and Claude C. Chappell, Amherst, N.S., have purchased from W. F. Beatty a tract of timberland at Second River, Colchester County, N.S., and are starting to operate upon it immediately.

Edmond Charlebois, whose woodworking factory at Lachute, P.Q., was recently destroyed by fire, has commenced to erect a new building, which will be of brick construction and much larger than the former one.

Plans have been completed for increasing the output of the St. Lawrence Pulp and Lumber Corporation, a subsidiary of the North American Pulp and Paper Company, to 75,000 tons annually. Its present capacity is 37,500 tons of sulphite pulp.

The sash and door factory belonging to Ed. Charbonneau, at Lachute, P.Q., was recently destroyed by fire. The loss is estimated at $15,000, with some insurance. The owner will probably rebuild and will be in the market for machinery for steam power.

The sash and door factory belonging to Adelard Paquette, St. Hughes, P.Q., was recently destroyed by fire. The loss is estimated at $15,000, with $20,000 and the insurance at $10,000. The owner will rebuild, and will probably require machinery for steam power.

T. H. Somerville, St. John, N.B., and H. J. White, Moncton, N.B., have been appointed inspectors in connection with the disposal of the property of the Thomas B. Calhoun Lumber Company, St. John, N.B., on behalf of the creditors. J. F. H. Teed, St. John, N.B., has been appointed assignee. The

Calhouns formerly operated mills at Calhoun, Westmoreland County, and at Gaspe, P.Q. They also operated extensively in Nova Scotia.

The Chicoutimi Pulp Company, a subsidiary of the North American Pulp and Paper Company, will increase its pulp mill capacity to 130,000 tons annually. Its present capacity is 80,000 tons of mechanical pulp. This plant is one of the largest mechanical pulp exporting plants in America.

La Compagnie d'Usinage et Garage de Chicoutimi has been incorporated, with head office at Chicoutimi, P.Q., and capital stock of $20,000, to carry on business as dealers in lumber, etc. Those interested are A. Bilodeau, W. Dufour, H. Bouchard, L. Hudon, and A. Bilodeau, all of Chicoutimi.

The Nashwaak Pulp and Paper Company, which is reported to have taken over the business of the Partington Pulp and Paper Company, St. John, N.B., is preparing to make an extensive cut of logs upon the Nashwaak River during the coming winter. It is estimated that they will take out 20,000,000 feet. This will be an increase of 4,000,000 feet over last winters output.

Savoie & Co., Manseau, P.Q., have recently added several new machines to their dressing mill equipment. They have also increased the power plant in this mill, and now handle on an average two carloads of lumber for dressing in transit daily. The company have also opened two ranges, seven miles long, to colonization, and have built a good road in the middle of the district. They are building a sawmill to manufacture lumber and timber required by settlers, and report that they have already had considerable success, having sold sixty 80-acre lots to settlers.

Western Canada

The Dominion and Western Lumber Company, Ltd., Saskatoon Sask., have been registered.

The shingle mill belonging to P. W. Fau Vel, at Burnaby, B.C., was recently destroyed by fire.

The sawmill belonging to Sidney Smith, Matsqui, B.C., which was recently destroyed by fire, is being rebuilt.

S. D. Trethewey has sold his mill and other property at Clayburn, B.C., to Messrs. Oliver, of Vancouver, and Witson and Sweeney, of Clayburn.

A report from Prince Rupert, B.C., states that a project is under way for developing pulpwood areas on Queen Charlotte Island, to be handled by a mill on the islands, with headquarters at Prince Rupert.

Burrard Sawmills, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $25,000, to carry on business as loggers, sawmill and shingle mill proprietors, lumber manufacturers, etc.

The Coast Central Mill Company, Ltd., has been incorporated with head office at New Westminster, B.C., and capital stock of $20,000, to carry on business as dealers in and manufacturers of timber, logs, lumber, shingles, etc.

The Fraser River Shingle Company Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as shingle and timber merchants and as dealers in shingles, logs, timber, shingle bolts, lumber, wood, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 29th day of November, 1916, for the purchase of license X603, to cut 3,247,130 feet of yellow pine and fir on an area adjoining lot 2089, Trout Creek, Kamloops District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 22nd day of November, 1916, for the purchase of license X695, to cut 11,180 cords of cedar shingle bolts on an area adjoining lot 14, Olson Lake, New Westminster District. Two years will be allowed for the removal of the timber.

A scarcity of logs has resulted in the closing down of the sawmill of the Columbia River Lumber Company, Ltd., at Golden, B.C. The log shortage is the outcome of the difficulty in securing labor in the logging camps. The total cut during the four and a half months' operation at the mill this year has been 20,500,000 feet. If it had not been for the early closing and the time during floods in the summer the output for the season would have been about 35,000,000 feet.

Timber inspector George-D. McKay reports that if the supply of labor keeps up logging operations on the British Columbia coast will probably be maintained all winter. The logging output during October scaled over 70,000,000 feet in the Vancouver district. Very few mills have any stocks of logs in their booming grounds. Nearly all of them are living on a hand-to-mouth basis, using up the logs as rapidly as they arrive. However, there is a great labor shortage, and some of the camps may be compelled to close.

A recent report from New Orleans, La., states that the British Admiralty will furnish a number of vessels for the shipment of a portion of 30,000,000 feet of Southern yellow pitch pine which is on order for Europe. A large amount of this will go to the British Government, and is being sent forward by the Standard Export Lumber Company of New Orleans. The shipments will be made from Gulfport, Miss., and Beaumont, Texas, by January 1st. One steamer carrying 3,000,000 feet of the order has already sailed from Gulfport.

The possibility for fast and accurate production—is the answer

Some of the special features of the "Clark" Horizontal Resaw are—

The method of returning stock through machine, eliminating expensive return system—The use of the lower part of saw blade, this means the resaw sets on mill floor where every part is accessible. Entire table twenty-four feet long raises and lowers—Elimination of sawdust around wheels as all dust and bark passes through frame to conveyor below. Hand or Steam Set-works—Range of thickness from ½ in. to 14 in., made in two sizes, 66 to 84 inches.

Many other special features are described in our Resaw catalog. Mailed on request.

We will introduce Jan. 1st our New Portable Band Mill complete. If interested write us for Catalogue.

BUILT BY

CLARK BROS. CO., Olean, N.Y., U.S.A.

Garlock Packings

Are made in over two hundred styles and combinations to meet every known requirement. We will assume entire responsibility in selecting the proper styles and combinations of our packings to work successfully and economically under any stated condition; and if goods are not wholly satisfactory to purchaser we will refund promptly the cost of same. A card will bring our new catalog which fully describes our various styles of packings.

Style No. 777

Style No. 150

Branches: Toronto, Winnipeg

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9 ft. wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. BRAZEL PLOWS cut 6 in. wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure heaps from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12 inches of loose snow each time the plow passes over.

"AMPHIBIA"

for 40 Years

"AMPHIBIA"

"Leather like gold has no substitute."

The Sawmill Belt

It requires something extraordinary in belting to stand up to the rough, wet and oily service of the saw mill. Amphibia, "The Saw mill Belt," is made for this kind of work. The leather used is specially tanned from choice hides. It is waterproof as a leather, and all the materials used in making Amphibia belting are also waterproof.

Try a sample run of Amphibia belting on the toughest run in your mill—the result will make you our customer.

How Is *Your* Work Going?

"Sit down, Thompson; how's the work going?"

"It isn't going—it's ***dragging***."

"What's the matter—men sore?"

"No! There s no complaint. Grub is good; men seem willing enough—but they don't put their heart into the work."

"Say, Thompson, why don't you get real beds for the men, ***like the one I'm sitting on?***"

"Holy mackerel! I ain't running a Ritz-Carlton Hotel at my camp."

"I don't mean brass beds and Ostermoor mattresses; I mean sanitary steel bunks ***with real springs***. They will be money in your pocket."

"You mean money ***out*** of my pocket."

"No, sir! The trouble with your men is lack of rest. They don't get a good night's rest on those hard, wooden bunks of yours that can't possibly be kept free from vermin; they can't do a day's work. Those old bunks are costing you a pile of money, because they are keeping the men from doing their best work.

"Tell you what, Thompson, rip out the old wooden shelves that your men are trying to sleep on—put in ***'Alaska' Sanitary Steel Bunks***—and you'll find that your men will turn out about 25% more work. I proved it myself, and so did Miller." (***So have many others.***)

Alaska Sanitary Steel Bunks Cost More, But are the Cheapest in the End.
It's Not Too Late to Equip *Your* Camp With Them. May We Quote You?

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

THAT BIG ITEM
TIME

Let the Accurate and Unfailing International Compute it

It is one thing to buy a commodity—another thing to get it, and still another matter to be sure of full measure.

The most elusive raw material that you buy, and the one which represents your greatest investment, is TIME.

Hour-glass methods of time keeping are no longer practical in a modern plant. You need an International to keep an accurate account of the millions of minutes you buy each month.

There are 260 different styles of International Time Recorders. One of them is perfectly suited to your requirements.

A Successful Dry Kiln

Here's what a manufacturer of pianos and organs says of a

Sturtevant Kiln:

Trade Mark

"We have two dry-kilns which are operated in this manner, one along side of the other; one in which we place the green lumber that is shipped us, what is usually called shipping dry. This stock is all steamed before the suction fan is placed on it. The other kiln we use for lumber that has been on stick on our yard for from one to two years, and on this we do not apply any steam, simply running it through in about ten days for immediate use. The green lumber, however, in the other kiln is steamed several days and is put through drying apparatus for about three weeks before it is taken out. We have never had any case hardening using this method, neither have we had any warping, in fact we are perfectly satisfied with the results."

We can quote you dozens of cases where our Kilns are giving excellent service.

Talk it over with one of our drying engineers or get catalog 220-C.

B. F. Sturtevant Co. of Canada, Limited

Montreal Toronto GALT, ONT. Winnipeg Vancouver

Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

"Maple Leaf" Brand

Stitched Cotton Duck Belting

A trial Belt will convince you. Write for prices and samples.

Excels all others in economy, strength, efficiency and true running, whether for transmission of power or conveying. A test recently made at McGill University, Montreal, of a 6-ply **"Maple Leaf"** belt, a light double leather, and a 6-ply rubber belt, showed that our **"Maple Leaf"** Belt stood a breaking strain 50 per cent. greater than the leather, and 25 per cent. greater than the rubber belt.

"Maple Leaf" Main Drive Belts
Are the Best on the Market

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production,	905,442,000 ft. B.M.
Pulpwood,	246,282 cords.
Railway Ties,	5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

"Rogers" Automatic Knife Grinders

TYPE "B"
Full Automatic Feed—Water Attachment

Here is a heavy, substantial, magnificent machine, adapted for all kinds of grinding, from the heaviest to the lightest: grinds fast or slow, straight or concave bevel as desired.

NO VIBRATION—the perfect acting center support and the conical standards at each end have positively eliminated all vibration, producing uniform edges on all knives.

We make a complete line of

KNIFE AND SAW FITTING MACHINERY

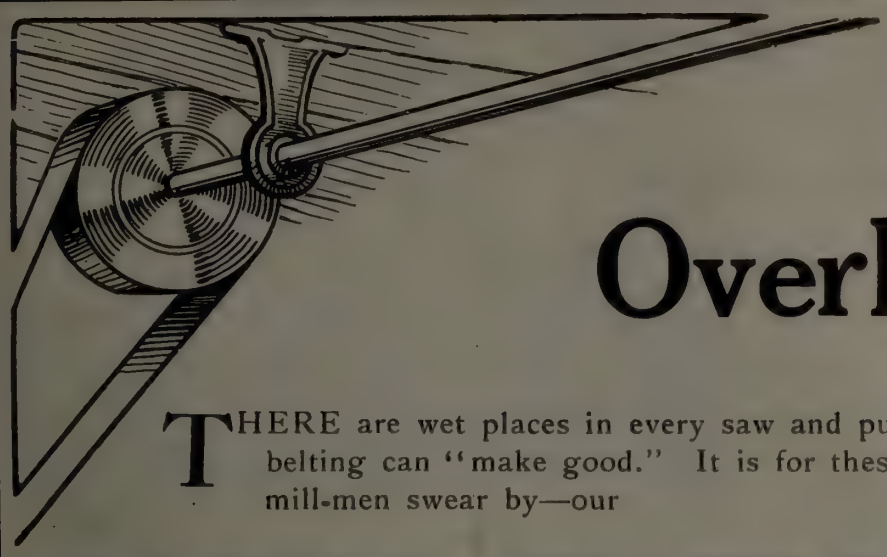
Samuel C. Rogers & Co., No. 18 Lock St., BUFFALO, N. Y.



When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

this belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.
When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

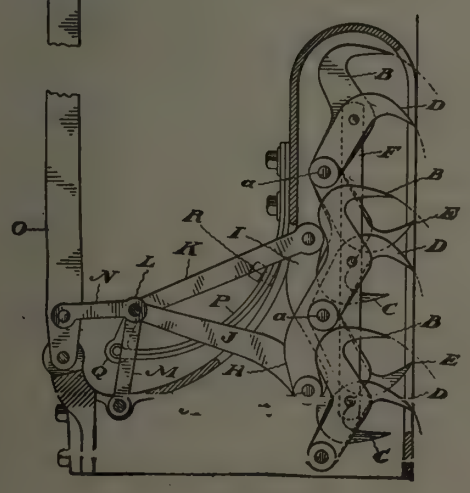
A Boon to Lumbermen
Payette's Famous Patent Mill Dogs
650 Sets already sold

Fig. 1.



BECAUSE

(1) They will dog with perfect ease and safety in any class of timber.
(2) Will dog just as easily, frozen maple or hardwoods of any description.
(3) Will dog the last board, just as easily as they dogged the first one.
(4) They do not tear the board or stock.
(5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves, Five different classes and styles of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.
Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.
Descriptive Booklet and prices mailed free upon request.

EST. 1880 "FACTS FIRST"
James D. Lacey & Co.
EXPERIENCE : RESOURCES : PRECISION

Knowing
vs.
Guessing

Every lumberman knows, of course, that even laboratory care would not make it possible to measure every board foot in a tract of standing trees. Even a LACEY REPORT is, in the strict sense, an estimate.

It is perfectly true, however, that the more elaborate the care and the greater the proportion of actual measurement, the nearer to the actual facts an estimate becomes. The skill and experience of the expert timber cruiser are most necessary, but no amount of skill and experience can take the place of science, care and double checking.

LACEY REPORTS are a compound of the proper proportions of experience, skill and science, and will give you the nearest possible approach to actual knowledge of the quantity, quality and distribution of timber in the tract you think of buying or selling.

Lacey & Co.'s International Files are at your service with the stumpage figures of many tracts now in our hands for sale all over the timbered world. You will do well to consult us concerning any transaction involving standing trees.

Send for our Booklet, "Pointers."

This Valuable Book sent all Belt Users for the asking

THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

IN MANY SUCH FILING ROOMS AS THIS ALOXITE SAW GUMMING WHEELS ARE MAKING RECORDS IN MAKING GOOD

CLEAN, fast, cool, cutting wheels they are, that cut without "protest"—creating no undue heat—cutting without drawing the temper or case hardening the saw—requiring but little dressing and showing long life.

In a Michigan mill, under their conditions, an Aloxite wheel recently worked 129 days—always cutting fast, free and cool and was not dressed once.

Suppose you put in a trial wheel—then ask the filer

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

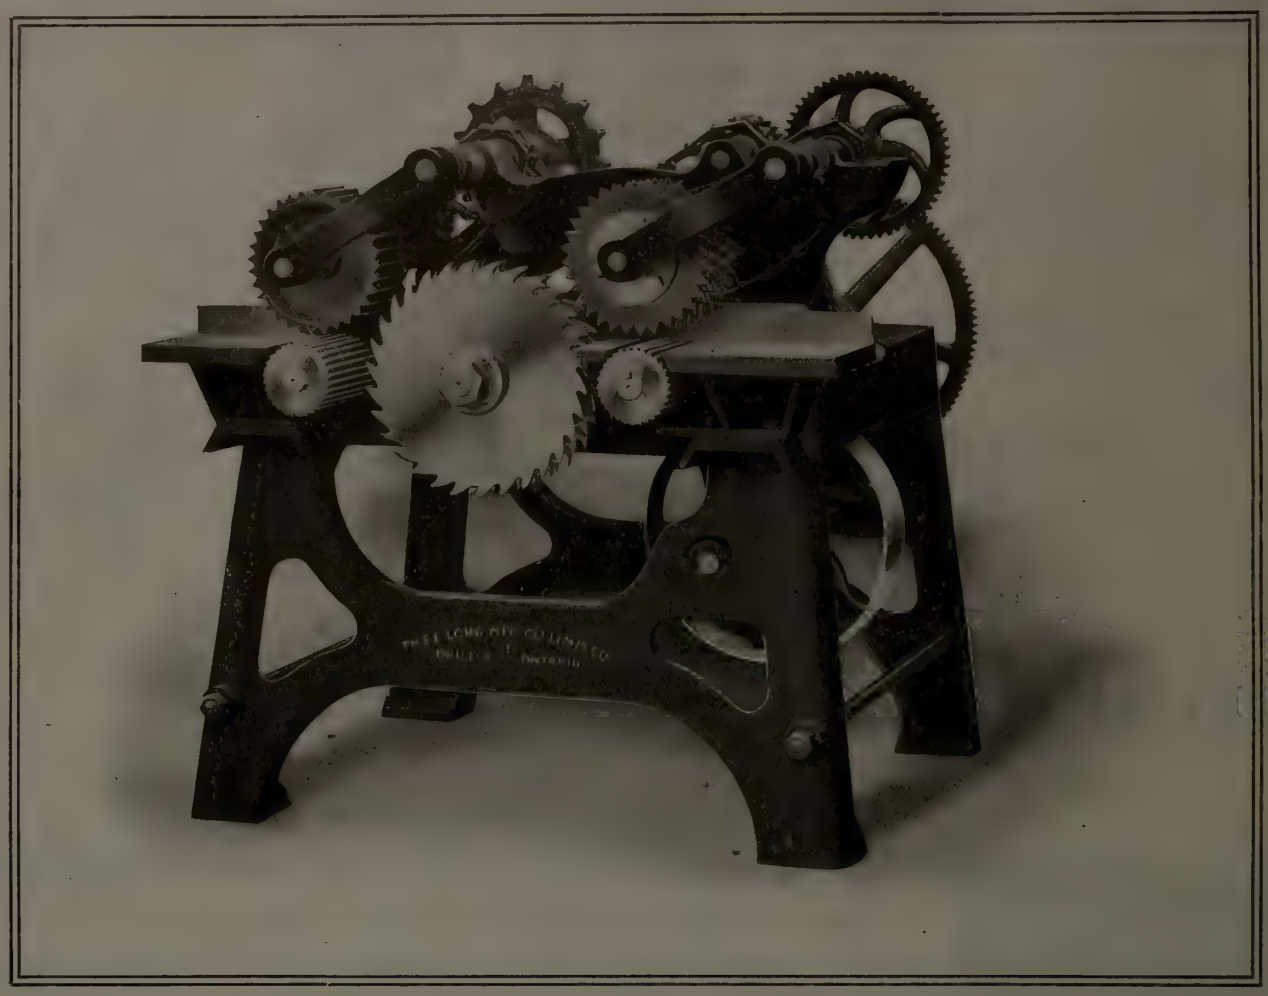
CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. **Get Catalog "H."**

CLIMAX MANUFACTURING CO., 313 W. Main Street, CORRY, PA.
VANCOUVER MACHINERY DEPOT, LTD., VANCOUVER, B.C.



This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

No. 2 Bolter

This No. 2 Bolter is the ideal machine for the mill of medium production using a single band or circular. It will handle **all** the slabs from such a mill with ease.

The frame is of unit construction, the three saws are of 16 inches diameter adjustable for lath, pickets or slats and the feed rolls are power driven.

For a solid substantial machine of ample capacity you cannot beat our No. 2 Bolter.

Ask us for catalogue.

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

The Long Lumber Company

HAMILTON, ONT.

FOR SALE: Standing Timber, in Large or Small Blocks and Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 80 h.p. Generator, 250 volt.

1 80 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Parry Sound Lumber Co., Limited, 26 Ernest Ave. Toronto, Can.

ROCHESTER, N. Y.

SEPTUM and SHORTLEAF

Assume yourself in the consulting room of a nose specialist:

Specialist—"Your trouble is in the Septum."

You—"Is that so. What's a Septum?"

Specialist—"The partition between your nostrils."

You—"Now I get you. You're speaking my language."

Assume a prospective layman home builder in your office:

P. H. B.—"What do you recommend for interior trim?"

You—"Shortleaf."

P. H. B.—"What's Shortleaf?"

You—"Well, Shortleaf — —" then for fifteen minutes you try to explain.

P. H. B.—"Oh yes; well, I'll let you know." (Exits.)

Now assume you watch your step. Enter the P. H. B.

P. H. B.—"What do you recommend for interior trim?"

You—

Arkansas Soft Pine

P. H. B.—"So you handle the Satin-like Interior Trim? I read about it last week in the Literary Digest and House Beautiful. The manufacturers recommend it for stains or white enamel, and I have written for their literature. Let's go out and look at some of it."

You, to yourself, as you go out the side door together towards the shed—"This fellow is already half sold on Arkansas Soft Pine. I'll make him a customer when he sees the stuff."

Look Here, Mr. Dealer.

We are offering you Profits on the Silver Platter of National Advertising. Our stock is known to legions of prospective homebuilders as Arkansas Soft Pine. Trade Marked.

Are you still calling it Shortleaf?
If so—why?

Do you drive a "horseless carriage"—or—an automobile?

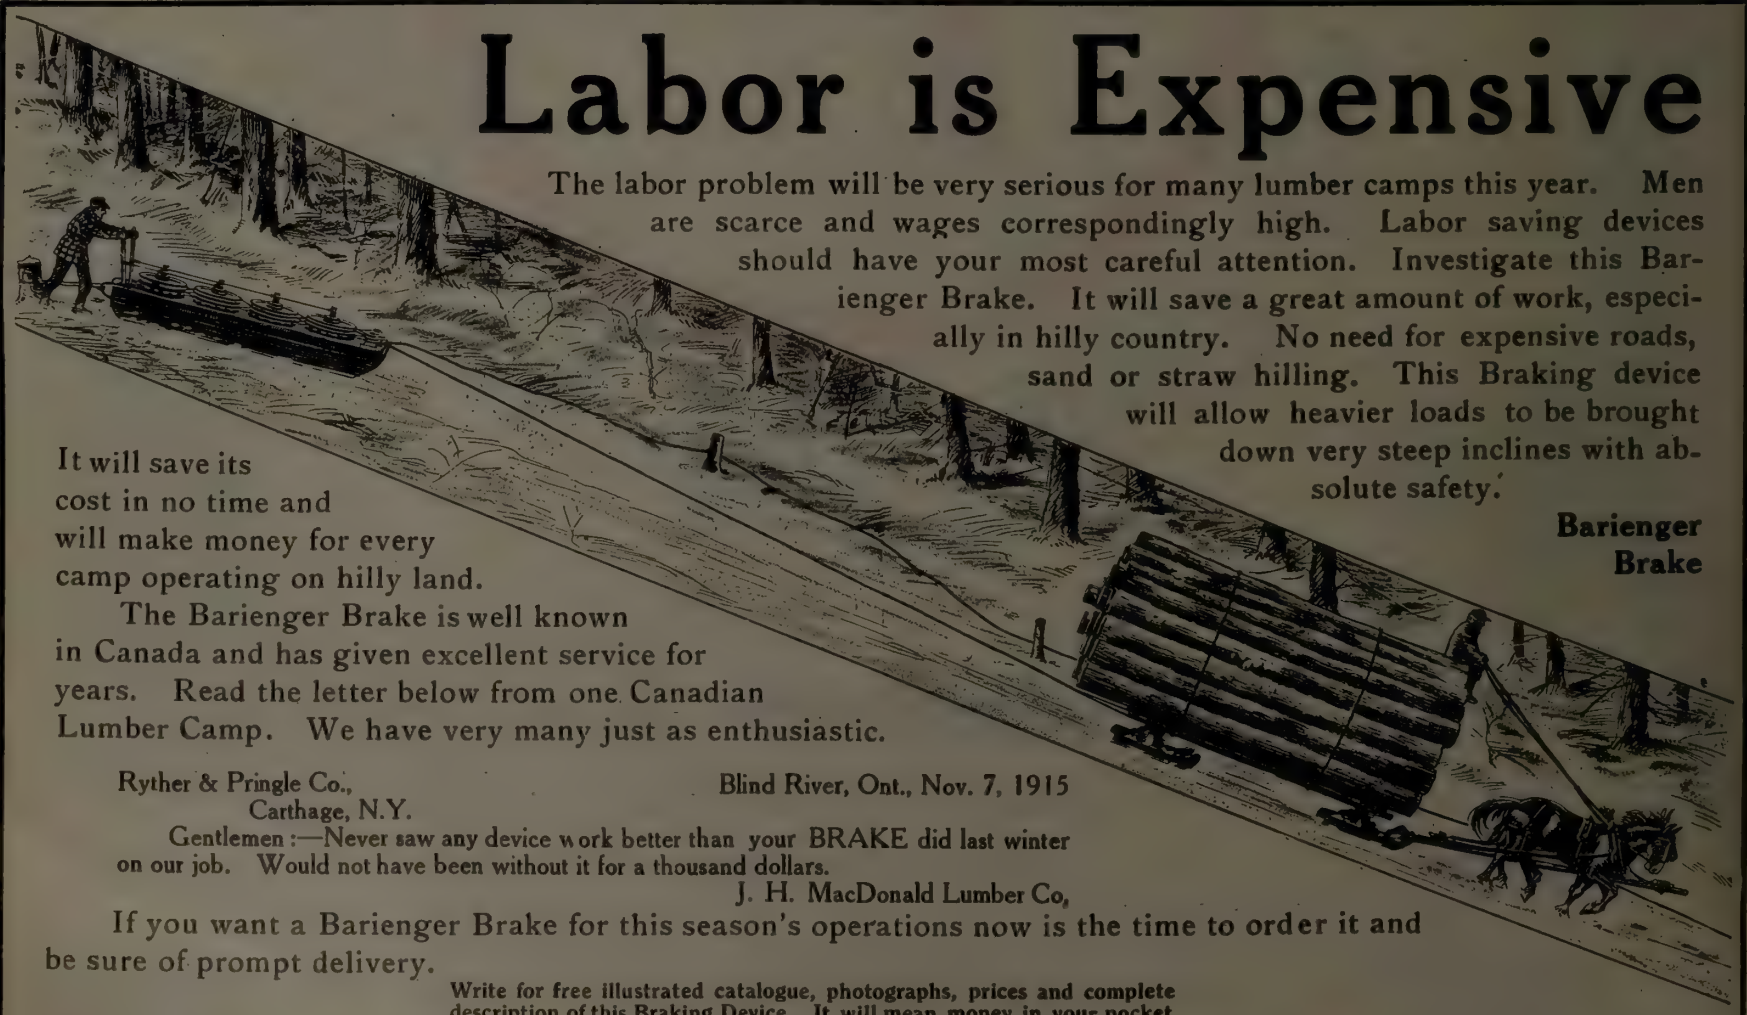
Labor is Expensive



The labor problem will be very serious for many lumber camps this year. Men are scarce and wages correspondingly high. Labor saving devices should have your most careful attention. Investigate this Barienger Brake. It will save a great amount of work, especially in hilly country. No need for expensive roads, sand or straw hilling. This Braking device will allow heavier loads to be brought down very steep inclines with absolute safety.

Barienger Brake

It will save its cost in no time and will make money for every camp operating on hilly land.

The Barienger Brake is well known in Canada and has given excellent service for years. Read the letter below from one Canadian Lumber Camp. We have very many just as enthusiastic.

Ryther & Pringle Co., Carthage, N.Y.

Blind River, Ont., Nov. 7, 1915

Gentlemen:—Never saw any device work better than your BRAKE did last winter on our job. Would not have been without it for a thousand dollars.

J. H. MacDonald Lumber Co,

If you want a Barienger Brake for this season's operations now is the time to order it and be sure of prompt delivery.

Write for free illustrated catalogue, photographs, prices and complete description of this Braking Device. It will mean money in your pocket

Ryther & Pringle Company, - Carthage, N. Y.

SURROUND YOUR BUSINESS WITH NEVER-FAIL BELTING

"Strength of Gibraltar," while not our phrase, aptly applies to the rubber belting made by us and sold under the name "**Gibraltar Redspecial.**"

⚜ ⚜ ⚜

It would be interesting to us if you, as a user of belting, would, before making your next purchase, get a verdict on "**Gibraltar**" from some of your friends.

⚜ ⚜ ⚜

Ask them if a stronger belt than "**Gibraltar**"—one giving more service with less loss of power—can be obtained anywhere; if any other product will survive heavy loads better; and, if, in withstanding the jerky strains consequent on fluctuation of power, any other belt can show a higher quality of friction in uniting the plies than "**Gibraltar Redspecial.**"

⚜ ⚜ ⚜

We have evidence aplenty, in the form of voluntary testimony, which shows that for strength, durability and general service "**Gibraltar Redspecial**" is matchless. In the Biggest Saw Mills, Biggest Pulp and Paper Mills, Biggest Manufacturing Plants, one "driving force" is nearly always in evidence—Dunlop "**Gibraltar**" Belting.

⚜ ⚜ ⚜

For Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work, there is nothing better than Dunlop "**Gibraltar Redspecial**" Belting.

⚜ ⚜ ⚜

And what Dunlop "**Gibraltar Redspecial**" means to users of Transmission Belting, Dunlop "**Samson**" ensures to users of Conveyor or Elevator Belting.

NO LOAD TOO HEAVY

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, December 1, 1916 No. 23

The General Trade Situation

The car shortage which has been handicapping business so greatly in the United States during the past month and for which there seems to be very little relief in sight as yet, has fortunately not been of anything like the same dimensions in Canada in connection with transportation up Canadian railroads. While there is considerable delay and difficulty in connection with shipments from New Brunswick, Nova Scotia and Quebec points into Ontario, on account of the scarcity of cars, the situation elsewhere in Canada is not so acute as is usual at this time of year and the indications are that at an early date plenty of cars will be available for a normal volume of trade. In fact the real trouble today is not so much shortage of cars as shortage of labor for loading and unloading cars at points of origin and consignment. Recently this shortage of labor has given rise in some cases to embargoes upon shipments to certain important markets, such as that which was put into effect by the C. P. R. in connection with shipments into Toronto early in November. If there were a fair supply of labor today there would be reasonably satisfactory loading and discharge of shipments. Of course, the shipment of lumber into Canada from United States points is affected by the shortage of cars in that country, but from a number of reports that we have received from large shippers we are able to state that Canadian shipments are not really suffering from a car shortage, something for which we have to be extremely thankful in these days of general industrial disturbances.

The lumber trade situation in Canada today is encouraging. During the past month or two there has been an unquestionable improvement in all lines. The demand which had been to a considerable extent stationary almost since the outbreak of the war, with the exception of that for shell boxes and other war materials, has commenced to improve. The statistical situation of the industry has been bettered steadily during the past two years. Production has been curtailed to a great extent by natural rather than by artificial causes, and during the present winter it will be curtailed to a far greater extent than ever before. The retail trade have learned of this situation and are now buying stocks, knowing that next year they will be able to sell anything they have on hand at prices considerably in advance of those prevailing today. Large consumers are coming into the market extensively for similar reasons, foreseeing that they will have to pay more next year for their stocks than they are paying today. This situation has been brought about logically by the scarcity of the supply, the high cost of production and the fact that demand is steadily increasing. Today, it begins to look as though the buying movement will reach much greater proportions within the next month or two than it has already attained and that the new year will find most of the yards and consuming industries supplied with stocks to carry them through until spring. For this reason we expect a decline in the volume of trade during the early months of 1917.

The hemlock situation is interesting. At the mills today, manufacturers are asking $19 to $20 for No. 1 hemlock, good sizes. Delivered at Toronto the price comes to about $21.50 to $22, and we hear that some manufacturers are considering the advisability of asking higher prices still. Without wishing to restrict the improvement in the hemlock trade, we cannot avoid expressing some of the views we heard while calling upon the wholesale trade, namely, that manufacturers of hemlock must not overlook the yellow pine situation. Stocks of yellow pine that will take the place of the above stocks of hemlock are being offered today delivered at Toronto for $21.75 to $23. There is practically no margin between the two lines. From past experience the hemlock manufacturers know what happens when the flood gates for yellow pine are opened. Hemlock simply has to take a big drop when this happens. It may be the better course now not to ask higher prices for hemlock unless the situation in connection with yellow pine improves sufficiently to warrant such a step beyond any doubt.

The export trade situation is also interesting today. The latest information we have regarding ocean freight rates is not encouraging. It indicates another extensive increase. A month ago it was possible to get space from east coast points to Glasgow for 260 shillings per standard. Today, very little space is offering, and for it the shipping companies are asking 325 shillings per standard. The course of ocean freight rates during the past year and the present situation in connection with the submarine activity of Germany lead to a general feeling that space will be more expensive next year than ever before. In September, 1915, the rate was about 150 shillings. In November, charters were made from Boston to Glasgow at 180 shillings. Then the rate advanced from 185 shillings in December to 260 shillings in February and "first open water" quotations reached 400 shillings, as compared with 175 shillings to 250 shillings a year ago. No contracts are yet reported for "first open water," 1917, it being still considerably too early for such business.

Metal or Lumber Clad Barns—Which?

A recent issue of the Uxbridge Journal, published at Uxbridge, Ontario, contains an article headed "A Lumber or Metal Clad Barn—Which?" It is interesting reading because of the subtle way in which an attempt is made to convince the farmer that a metal clad barn is more permanent and cheaper than one of wood.

A comparison is made between two barns, each 36 feet wide and 56 feet long, with side walls 16 feet high, and having a gambrel roof. It is assumed that the frame will be of lumber in both cases, and will cost $500. We are next to assume that the farmer will be in a state of doubt and anxiety as to whether to cover the roof and the sides with metal or with wood. In the comparative estimate, the best showing that can be made is that the metal clad barn will cost $155.75 more than the all wooden barn. The metal covering would be galvanized corrugated iron at $6.00 per square.

Without looking into the details of metal prices or checking the accuracy of the lumber costs, the forced arguments in favor of the metal barn are found to defeat themselves. It is stated that the depreciation on the metal clad building, according to the "Valuators Tables of Insurance Companies," (whatever they are), "is never greater than 1¼ per cent. per annum, while on a wooden building it

is not less than 2½ per cent." (it is not clear whether this depreciation figure comes from the same source). The metal clad barn costs $1,282.75 with a depreciation of 1¼ per cent., or $16.03 per year, and would last 80 years before the complete cost was expended in repairs. Now look at the poor wooden barn. With an original cost of $1,127 and depreciation of 2½ per cent. the building would last only 40 years before the complete cost had been expended in repairs.

A wooden barn which does service 40 years is a pretty fair investment; yet many have greatly exceeded this life. If a metal barn has ever been built which lasted this long no one has every heard of it. It will be a sad day for the stock which is sheltered only by what was left of galvanized corrugated barn siding after 80 years, or even ten or twenty years. Not long ago farmers in northern Michigan were beseiged by metal barn covering salesmen, and some of them were persuaded to buy metal covering for their buildings. If the advocate of the metal barn talked to a few of these farmers now he would get a decidedly different impression of its lasting qualities.

We have seen a roof of old fashioned black iron, which by being kept well painted, had lasted 27 years. We have also seen galvanized iron roofing which rusted through in less than ten years. How anybody can talk about the metal barn lasting eighty years and get away with it, is more than we know. Surely no sane farmer will believe it.

Export Timber Trade of Quebec

At a recent sitting of the Dominions Royal Commission, held in Quebec, P.Q., one of the witnesses was Mr. John Burstall, of the firm of J. Burstall & Company, timber and lumber merchants, Quebec. In the course of his testimony Mr. Burstall said that the amount of timber handled in Quebec for export was a very large one, but late years has seen a material reduction. Practically all the pine, oak, elm and birch logs brought to Quebec are for export to Great Britain, though there is at times a fair local demand. The average of five years export, from 1904 to 1908 are given as:—

Pine: 1,447,229 cubic feet, or 28,940 loads of 50 cubic feet.
Oak: 433,904 cubic feet, or 8,660 loads of 50 cubic feet.
Elm: 355,707 cubic feet, or 7,115 loads of 50 cubic feet.
Birch: 179,551 cubic feet, or 3,550 loads of 50 cubic feet.

In 1915 the export was:—

Pine: 346,440 cubic feet, or 6,930 loads of 50 cu. ft. Value $285,221.
Oak: 187,160 cu. ft., or 3,740 loads of 50 cu. ft. Value $139,332.
Elm: 173,040 cu. ft., or 3,460 loads of 50 cu. ft. Value $162,233.
Birch: 273,920 cu. ft., or 5,480 loads of 50 cu. ft. Value $99,391.

For 1916 the figures are not out yet, but will probably show an increase in oak and a decrease in the other lines.

The method originally employed to take the timber to Quebec was to float it down in rafts. To-day, however, the timber is mostly made at points too far away from navigable waters to allow of it being floated, and it all comes by rail. This has naturally enormously increased the cost, especially as some of the distances are great.

To take the most important woods separately:

White Pine:—This comes chiefly from Ontario, and is the finest known wood for deckplank for steamers or for pattern making. It does not split or shake as does Oregon pine, which is sometimes used for the same purpose. The logs have to be of good average, say 20 inches calliper or so, and there is only a percentage of this sized timber in even the best pine forests of Canada. The British Admiralty, the machine makers in the Manchester district and shipbuilders are the consumers of this kind of pine. The war has very adversely affected the consumption of this line.

White Oak:—This wood is largely produced in the northern States, practically all the export goes to the larger railways of Britain. The timber has to be 18 feet and up and 13 inches and up, and runs 55 to 60 feet average cube. The business is generally rendered difficult, owing to the competition in selling with oak which comes from the southern States, and also Odessa and Dantzic. These latter ports are, of course, closed now, and this has had an effect on the oak shipments here.

Rock Elm:—The best of the different kinds of elm is produced in Ontario, Michigan and Wisconsin, and is used chiefly by the British Admiralty, and the shipbuilders. It is usually 20 feet and up and 12 inches and up, and usually averages 40 to 45 feet cube. The war has not affected this market, as the production is limited, and so long as the price, which is now very high, is not unduly inflated, there is a market for the output.

Grey Elm:—A small quantity of this wood is shipped, chiefly for furniture wood.

Birch:—Is manufactured in the district surrounding Quebec, and is the cheapest wood shipped from Quebec. It is an excellent furniture wood, and is today also being used largely in the manufacture of certain shell boxes. It averages as a rule 15 to 18 inches calliper, and runs about eleven feet average long.

The above mentioned lines comprise about all the wood shipped as timber from here.

The timber is brought down in a fairly well manufactured condition, and is placed in the different coves here to be culled, and if necessary butted, and dressed before shipment.

A serious trouble in the timber trade here at present, is the question of licenses to allow of the wood entering Britain. Special licenses are required for oak, elm and birch deals, birch logs being admitted. As oak and elm are required this year for certain urgent work, a certain amount of special licenses were issued. But great doubt exists as to the future, and trees have to be felled many months before they are in the shape in which they are shipped. As elm is absolutely required for shipbuilding, oak for railway work, and birchplank to a certain extent for munition boxes, it may be doubtful if it is wise to do anything to interfere with the manufacture of these woods. It would be unfair not to mention that the Import Restriction Committee have stated they will do what lies in their power to help Colonial shippers, but they are, of course, bound by the regulations.

Canada's Increasing Foreign Trade

The trade returns of Canada for the four months ended July, 1916, when compared with those for the same period in 1914 and 1915, show an increase in the value of merchandise imported and exported. During the period 1916 the value of the grand total of the imports and Canadian exports—taking no account of the movement of coin and bullion—amounted to $600,213,172, as compared with a total trade in 1914 of $288,296,466 and in 1915 of $293,833,137, representing an increase over that for 1914 of $311,916,706, or 108.2 per cent., and over 1915 of $306,380,035, or 104.3 per cent.

The value of the imports of merchandise for the four months ended July, 1916, was $249,867,867, an increase of $79,137,955, or 46.4 per cent. when compared with the corresponding period in 1914, and, compared with 1915, an increase of $115,202,989, or 85.5 per cent.; whilst the value of the total exports of merchandise amounted to $356,410,103, an increase over the exports in 1914 of $224,177,200, or 165.9 per cent., and an increase over 1915 of $185,747,387, or 108.8 per cent.

The exports of Canadian merchandise were valued at $350,345,305, an increase of $232,778,751, or 198.0 per cent. when compared with the four months ended July, 1914, and an increase of $191,177,046, or 120.1 per cent. when compared with the same period in 1915; whilst the exports of foreign merchandise amounted to $6,064,798, a decrease when compared with 1914 of $8,601,551, or 58.6 per cent., and a decrease of $5,429,659, or 47.2 per cent. when compared with 1915.

The part played by our foreign trade in lumber and timber in this expansion of trade is an important one. During the four months ending July exports of wood and manufactures of wood from Canada were valued at $24,900,000. In 1915 the corresponding total was $19,000,000 and in 1914 $17,743,000. The exports of unmanufactured wood during the same four months were valued as follows: 1916, $19,568,000; 1915, $16,179,000; 1914, $14,850,000. The totals given above were for exports chiefly to the United Kingdom and the United States, and the increases were at about the same rate in regard to both countries.

The exports of lumber during the same four months were valued as follows: 1916, $16,470,000; 1915, $13,503,000; 1914, $11,400,000. The exports of spruce deals and other deals, exclusive of pine, during these four months, were valued as follows: 1916, $3,458,535; 1915, $3,303,126; 1914, $1,980,164. Exports of pine deals were valued as follows: 1916, $811,788; 1915, $388,201; 1914, $429,028.

Bathurst Company May Build Ships

New Brunswick Lumber Manufacturers Planning New Venture if Government Grants a Subsidy.

Mr. Angus McLean, general manager of the Bathurst Lumber Company, Ltd., Bathurst, N.B., advises us that his company is considering the formation of a company for the building of wooden ships. The carrying out of the proposition depends upon whether the Dominion Government will provide a subsidy for the industry. The Bathurst Lumber Company, Ltd., have been figuring on this matter for a year, Mr. McLean says, "but under present conditions it is difficult to put the plan into operation. There is an acute scarcity of labor for industries already established, and an entirely new industry would undoubtedly be handicapped by the same cause. The business would certainly require governmental nursing for a few years, until it became established. In fact, we would not care to start a proposition of this kind unless the government offered a subsidy. Any subsidy, of course, would be general. Bathurst has no claim to preferential treatment. The government is being urged strongly to grant subsidies for this object, and I fully believe it will do so during the next session of parliament. If Bathurst gets its share, we will organize a company with local capital, and start building two ships, to be ready for launching in the spring of 1918. Our plans are necessarily in abeyance until we know definitely what the government intends to do. Wooden ships can be built here as well and as cheaply as anywhere. We have an abundance of the main raw material right at hand.

"The demand for new shipping, which is almost bound to grow greater as the war is prolonged, will still further augment the rise in the prices of vessels, and the inevitable result will be that the more ships built the more expensive will shipbuilding become. The world simply must have more ships to make good the shortage, and it is almost true to say that practically anything that floats will be pressed into service. Any less there may be in the comparatively slowness of voyage of the smaller wooden ship will be more than offset by the less amount of interest such a ship will have to earn to cover charges on her working capital. Bunker coal for steamers is certain to maintain a high figure for some time to come, and here, again, the sailing vessel wins out.

"We propose to build sailors of from 500 to 1,000 tons. Nowadays when we speak of 'sailors' we do not necessarily mean ships dependent for their motive power upon wind exclusively. Various types of international combustion engines can be adapted for quite large vessels, as they have been for automobiles, aeroplanes, and launches. We shall probably fit either gasoline or crude oil engines into our ships, and the making of these in themselves may in time become an important industry in Bathurst."

Great Britain Reducing Paper Imports

According to the latest issue of the Weekly Bulletin of the Department of Trade and Commerce, there was a substantial decline in paper imports into Great Britain during the month of September, the quantity being less than in any previous month of the current year and only a little over one-half the total during September, 1915; also 32.8 per cent. less than the total for September, 1914. The receipts during September in the last three years were as follows:

	Cwts.	Approximative.
September, 1916	640,740	$3,262,270
September, 1915	1,118,220	3,231,530
September, 1914	954.559	2,541,105

In spite of the decrease in quantity during September, 1916, the total value records an increase of 28.3 per cent., which illustrates the marked advance in the price of paper. The total quantity of paper on reels imported shows a decrease of 61.3 per cent. The main bulk of the total imports came from Newfoundland, 56.88 per cent. Imports of print paper and writings not reeled fell 35.4 per cent., compared with September, 1914, and there was a decrease of 15.0 per cent. in packings and wrappings. Shipments of strawboard showed a decrease of 17.1 per cent., and those of mill and wood-pulp boards a decrease of 21.66 per cent. compared with September, 1914.

Lumber Price Fluctuations, 1913-1915

According to the report upon wholesale prices in Canada for the year 1915, published by the Department of Labor, Ottawa, there was an almost continuous decline in the price of lumber from 1913 to the end of 1915. In preparing a chart of lumber prices the average prices from 1890 to 1899 are taken as the standard, and the advances or decreases since that time are quoted in percentages, the standard being considered as 100. In the year 1910 the prices of lumber, including all the chief lines of lumber produced in Canada, stood at an average of 160, indicating an advance of 60 per cent. over the prices during the standard period. During 1911 the prices advanced rapidly during the first three months, reaching 167, where they continued during the next three months, then falling to 163 during July, August, and September, and closing the year at 164. During 1912 a gradual advance occurred, with slight fluctuations, until at the close of the year it stood at 170. The year 1913 opened with rapidly advancing prices, which continued throughout the first nine months, reaching 185 at the end of September, and easing off to 184 at the end of December. This decrease, which commenced about October, 1913, was continued practically throughout 1914 and 1915. At the end of 1914 the price was 179 and at the end of 1915 it was 175.

French Market for Canadian Pulp

A recent report from Mr. Philippe Roy, Commissioner General for Canada in Paris, includes a memorandum prepared by the French Epinal Chamber of Commerce regarding conditions under which chemical and mechanical wood pulp are imported from Scandinavian countries, particularly Sweden, into France. It is hoped, the Commissioner says; that Canadian manufacturers may get in touch with the Epinal Chamber of Commerce and learn how to meet the necessary exporting conditions, so as to enlarge the French market for Canadian pulp. The report says:—

According to sellers, conditional terms of delivery vary greatly. Some deliver with a freight guarantee, others without guarantee as to freight rates, unless freight is charged at the rate ruling at the time of shipment. Some adopt the date of departure for the rate of exchange, others the day of arrival. All the demurrage charges are borne by the buyers. In the case of pulp in a dry state, that is to say, absolute dryness with an addition of 10 per cent., prices c.i.f. Rouen current up to the present, demurrage not included, are as follows

Chemical pulp: 72 francs per 100 kilos dry.

Mechanical: 45 francs per 100 kilos dry.

These prices are meant to be c.i.f. Rouen, transit, handling and demurrage charge being at the expense of the buyer. Exchange is in crowns at the normal rate of 72. Average quality is similar to that supplied by Canada. Delivery takes place until the closing of the Baltic ports by ice. Even in average grade, Scandinavian pulp is preferred. The small business transacted with Canada does not increase because Canadian offers were made by brokers without experience (some even taking hundredweights for tons), who gave no details as to accessory conditions which may increase prices from 30 per cent. to 40 per cent. The time would now be appropriate to prepare business for delivery between December and May, when the closing of the Baltic does not allow transportation, unless the Swedish railroads are used to Gottenburg.

The Scandinavian production offers wet pulp at prices from 3 to 3.50 francs lower than the prices previously indicated.

Cumulative Demurrage Introduced by U. S. Railroads

United States railroads have filed cumulative demurrage tariffs with the Interstate Commerce Commission, to become effective December 1, 1916. These tariffs increase the demurrage charges, after the expiration of the free time, to the following rates: $2 for the first day, $3 for the second day, $4 for the third day, $5 for the fourth and each succeeding day. At points where track storage is provided for it is proposed to assess $2 per day in addition to the track storage, but the $3, $4, and $5 charges will apply only when the addition of $2 to the storage rates makes a sum less than the advanced demurrage charge. On behalf of the members of the National Wholesale Lumber Dealers' Association, a protest has been filed with the Interstate Commerce Commission for the suspension of these tariffs pending hearing and investigation.

Flume Builders May Expropriate Where They Please

An interesting and important judgment was given in the Supreme Court at Vancouver recently regarding the power of a timber company to expropriate a right of way through another's property for the purpose of constructing a timber flume. The case was one in which R. A. Olds and G. F. Crocket had applied for authority to expropriate for a right of way for flume through the lands of Mary Jane and Anna Collins. Counsel for the owners of the land in question stated that his clients wished the flume to follow the creek, but the loggers wanted to run it through the middle of their land. "Surely," he said, "his clients had some rights on their own lands." "Not in this case," said Chief Justice Hunter. A man who wanted a right of way to bring timber from Timbuctoo could get it under the act. Like a railway company, they could run their right of way through the other party's front parlor, if they desired to do so, and the only remedy was a claim for compensation.

A handy little booklet about British Columbia red cedar shingles has been issued by the Forest Branch of the Department of Lands of British Columbia. This is a reprint of Bulletin 18, put up in pocket-book size. It contains in brief form a description of the quantities, sizes, etc., of red cedar shingles and information in regard to the best manner for laying, staining, etc.

Work of Canadian Forestry Battalion

Converting English Forests into Trench Timber, Railway Ties, Etc. Splendid Service of Great Value to the Empire.

The operations of the Canadian Forestry Battalion in Great Britain have been the subject of many short articles and news despatches in the press of Great Britain and Canada, but no really extensive descriptions of their work have appeared until quite recently. We are pleased to be able to publish in this issue a couple of interesting illustrations of the work of this battalion and some detailed description of their work, secured from various sources.

Lumbermen in Canada will recall that the first Canadian forestry battalion to go overseas was known as the 224th, and that other battalions of a similar type have followed subsequently, while still another is being recruited and is now nearly up to strength. The latest reports received regarding the work of the 224th Forestry Battalion state that part of it has been working in the forests of the north of Scotland, cutting Scottish pine. One company of the battalion has also been at work in the Royal Park at Windsor Castle and another company in the New Forest in Hampshire. For these operations eight sawmills were sent over from Canada, six being for the 224th Forestry Battalion and two for the Forestry Committee in England, which has supervision over all lumbering operations for the Government during the war. These mills are typical of the Canadian lumbering industry, and resemble what we know in Canada as "portable" mills. They are, however, quite a novelty to the people of the British Isles, and their remarkable efficiency has attracted favorable comment wherever they have appeared. The capacity of these mills is from 15,000 to 20,000 feet per day each, and they include edger, slash saw, saws for making railway ties, etc., in addition to the 56-inch circular saw. Power is furnished by 40 h.p. locomotive boilers.

The Method of Operation.

A London correspondent, describing these operations, says:

"Not even in the days of the Armada and the wooden walls of England was there such a tree felling as is now going on in Great Britain. In every wood the sound of the axe and the saw can be heard, and lumber camps as picturesque as any on the Missouri are to be found as far apart as the Scotch fir woods and the Windsor and New forests, where the Canadian lumbermen are working. Behind the statement of Mr. Acland in the House of Commons, that the Home Grown Timber Committee had been successful in securing supplies, there lies a story of one of the best efforts that has been made by any government department to meet the present war emergency.

"The emergency work of the committee has included not only the importation of Canadian lumbermen, but the importation of Irishmen, and even of Portuguese, who are now employed in cutting pit props to supply the Welsh coal fields.

"By an order-in-council, under the Defence of the Realm Act, the committee has been empowered to commandeer all the timber resources of the country, but so far their action has been limited to negotiation with the land-owners, who, Mr. Acland says, 'have met them most fairly.' This step was rendered necessary by the fact that the Government had no large supply under its own control. Britain was not alone in failing to anticipate the consumption of timber which war would entail. In none of the belligerent countries, not even in Germany, had a proper estimate been made of the demand that would arise for ash wood for wagons, for fir for trench work, for woods for hutments, and for the thousand other needs of the army.

"There remains, however, this difference, that Germany and the other countries had their supplies at hand in the best possible condition of storage—in their forests—while the British even now, when tonnage has become so important a factor in the war, are importing some six or seven million cubic feet of timber each week. If in these circumstances the German submarine warfare had been more successful, there would have been necessary a wholesale destruction of British forests which would have laid England bare for a generation.

"Now much is being done to use Britain's own natural resources, and much more will probably be done during next winter, if the war lasts as long. Some definite plan must at once be laid down for afforestation after the war, and the three essential things the Government at that time must be certain about are where to plant, what to plant, and whether they have got the plants to carry out the scheme. Of these three the last comes first.

"The plants must be ready when the labor released after the war is available, and here a little war time discovery on the part of the committee is worth mention. They have discovered that Scotch fir makes better railway sleepers than imported pitch pine."

Regarding the work of the 224th Forestry Battalion from Canada in converting the standing timber of Great Britain into war material the London Times, in a recent issue, says:

"The lumber camp is all Canadian—men, machinery, and methods. The men, who are drawn from all parts of the Dominion, have the bronzed, healthy look and the easy, confident swing which we have learned to look for in Canadians. The khaki under their blue overalls proclaims them soldiers; they draw military pay and they know the rudiments of military drill; but first and last they are woodsmen, with

224th Canadian Forestry Battalion Operations in England—Scene at one of the Sawmills

their craft at their finger-tips. Every man knows his task and does it with an enviable independence of orders or instructions; yet from the first stage to the last the work proceeds smoothly and harmoniously. Let us follow the process, under the guidance of the officer in charge and the sergeant who is 'foreman of the bush.'"

Then follows a description of the actual felling of the trees and their conversion, in the portable mill, into such widths, thicknesses, and lengths as are required. To all intents and purposes these operations are similar to the operations on Canadian timber limits, the details of which are well known to Canadian lumbermen.

Canadian Portable Mills.

Describing the mill, the London Times says:

"The mill itself is a stoutly-built structure, made of timber cut and prepared on the spot, the saws and engines coming from Canada. It is practically a raised platform, covered by an iron roof, but open at the sides. A log to be sawn is rolled into position on a 'carriage,' which moves backwards and forwards to carry it through a circular saw. Two men, standing on the carriage, control its movements and the position of the log by a number of levers. Opposite them stands the most important man of all—the 'sawyer'—whose trained eye sees at a glance what can be made of this or that log. The hum of the engine and the screech of the saw would drown his voice, so he gives his decision by signs. As the carriage brings a log back through the saw with the bark removed, he will hold up one finger or two, and the 'setter' on the carriage, by movement of a lever, adjusts the log so that the next cut shall be one inch or two inches thick.

"It is all done without a pause. For hours the saw screeches and throws off a spray of sawdust as it slices up the logs that a short while before were splendid living trees, and all the while other saws, trimming the edges of the boards and cutting off the ends, join in the chorus. Is it surprising that the daughter of the keeper of the wood was reduced to tears when she stood by the mill?"

An interesting reference to the uses of timber at the front and behind the lines is contained in a recent issue of "Country Life in England," which says:

"War has turned out to be a great consumer of lumber. Passing by for the moment the wooden huts and wooden carts for lodging and transport, the miscellaneous crowd of wooden boxes, cases and implements fashioned for equipment, how dependent on wood is the soldier when he takes the field! It did not take him long to learn that in a country like Flanders, with modern guns pointing at them, trenches must be deep to be of the slightest use, and that if they were deep would not stand wet weather unless propped with wood. Conjure up a vision of the wood being employed in the trenches, not of one army only, but of many, and it will be understood that the timber-swallowing power of the coalpit as compared with that of the trench is as the swallow of the minnow compared to the swallow of the salmon. And yet the trench represents only a feature of the total, especially in these days when military science orders that front line trenches should only be lightly held. Behind are the much more elaborate dug-outs. In the original trench the danger experienced was that of rain bringing on a landslip. The occupant in more than one instance was buried up to the shoulders in earth, and shot by the enemy before he could be extricated. In the early dug-out many lives were lost by shrapnel and splinters. From these they are now fortified by a roof built of heavy beams laid side by side. Let it be realized what a consumption of timber this means. Yet, practically speaking, there is no choice as to material. Steel is possible, but is in too much demand for actual fighting stuff. Cement has been tried, but will not do.

"On the road behind the lines there is an immense employment of heavy timber, without which the present advance, for example, would not have been possible. When the great guns used by the Germans at Verdun and by us to demolish their trenches between the Ancre and the Aisne have to be got forward, the only way to do it is by temporary railway lines. Hence the demand for sleepers. And every sleeper signalizes that a large tree has been felled. Any intelligent student of the daily war news will be able to imagine without difficulty what a prodigious quantity of timber is being used up for this purpose alone. Nor can there be much need to enlarge on the other military demands for wood. It has been used freely, not only in bridge building across rivers, but to make a bridge or passage over roads that in the fearfully wet weather would otherwise have been impassable to heavy military traffic. The army is like a monster which has to be fed continuously on great shiploads of timber. The Home Grown Timber Committee is in this sense a great destructive agency, since it exists for the purpose of feeding this tremendous appetite as far as this can be done from home. Portugal, Spain, and France have contributed a vast share. The demand is almost exclusively for softwood, which is so much easier carried, manipulated, sawn, nailed, and so on, than hardwood."

The illustrations accompanying this article give a good idea of one of the sawmills used by the 224th Forestry Battalion. This mill was built by the Canadians on the spot. The men shown in the illustration are rolling logs to a point from which they will be hauled up by mechanical power to a platform where they are loaded on to the circular saw carriage; on the other end of the mill the timber comes out squared and ready for use. The other illustration shows timber which has passed through the mill being piled, ready for shipment when required.

Alexander MacKay MacLean, who is known to practically every lumber manufacturer and logging camp operator in the Ottawa Valley as the capable and genial representative of Hunter and Company, Limited, wholesale grocers, Pembroke, Ont., was married on November 1st to Laura Pearl McDowell, daughter of Thos. McDowell, at Shawfille, P.Q. The Canada Lumberman joins with "Sandy's" host of friends in wishing him every happiness.

224th Canadian Forestry Battalion Operations in England—Piling the Timbers Preparatory to Shipment

One Hundred and Twenty-four Years

Old Eckardt House, Unionville, Ont., Built of White Pine —Home of Early Ontario Lumbermen

One of the most interesting and historic houses existing in Canada to-day is shown in the illustration of a log house, published herewith. This is the old Eckardt home at Unionville, Ont. The building is constructed of white pine timbers and was erected in 1792. It is still occupied by a family (numbering no less than thirteen), and is visited by large numbers of people from Toronto and elsewhere who are interested in such a remarkable relic of the early days of Ontario. To lumbermen the building is doubly interesting on account of the fact that it is associated with the early lumbering industry of the province.

The original Eckardt to come to America was one Philip Eckardt, who settled in Philadelphia and came originally from Bruges, in Belgium. He followed his trade as a millwright and carpenter, and built several saw and grist mills on the Schuylkil River. Philip Eckardt had three sons—Philip, Abraham, and Gottlieb. The son Philip followed his father's trade as a millwright and carpenter, and moved to the northwestern part of New York State, up the Genesee Valley, and built a number of mills, some being near Lockport, New York. When at Lockport this Philip Eckardt was approached by a representative of the British Government with a proposition that he should form a colony in Canada. The result was the settlement at Unionville of some sixty families. Each of these settlers had to have a trade and be thoroughly conversant with pioneering. The government made them certain grants of money annually for ten years and gave them a considerable grant of land. These settlers arrived in the fall of 1792, and selected the Township of Markham for their land grant. They had a difficult time at first, as the land had not been surveyed, although the government had promised them that this would be done in advance. As a result they put in a trying winter, during which they had to put up with great hardships in the way of scarcity of food.

Philip Eckardt immediately commenced the construction of saw and grist mills at Unionville. The sawmill was placed on one side of the river and the grist mill on the other side. These were known as the German mills, and the place goes by that name to-day. The mills were located about 2¾ miles east of Thornhill and three miles west of Unionville. Some of the oak timbers of the old mill are still on the ground at this place and are in a remarkable state of preservation.

The settlers came across Lake Ontario on their way to Canada, bringing their stock of animals, household belongings, mill machinery, all in one load, and landed a little way up the Don River, about where Queen Street now crosses it. The river was a much larger stream in those days than at present, and the surrounding country was all forest. Flat-bottom boats were built, and the mill machinery, women, children, and furniture were sent up the north branch of the Don to the site of the mill. The horses and cattle went up old Yonge Street, blazing a service road as they went. The British Government formed a number of colonies of this sort at various points in the present Province of Ontario, such as Kingston, Unionville, Dundas, Newark (Fort Niagara), etc.

A great deal of valuable information regarding the life of these early pioneers is available, which we regret that we have not space enough to reproduce. A few more points of interest, however, may be mentioned. For instance, the debt that the Province of Ontario owes to such people is in a measure indicated by the fact that they were the first people to settle and cultivate the land, to establish various lines of trade and industry, and to lay the foundations of future growth and prosperity. In connection with the sawmilling industry at Unionville

Standing on an oak timber from Ontario's earliest sawmill at Unionville, Ont.

it is interesting to note that this mill turned out all the timbers and lumber then used for the erection of houses for the new population. In the building of houses and public buildings at Little York (now Toronto), considerable quantities of the product of these mills was consumed. Of course, the output of a mill in those days was very small compared with the output of modern mills. It is even said—partly, we suspect, by way of a joke—that the owner of the mill would start sawing a log and then go home to dinner. Upon his return he would find the log pretty nearly finished.

It is of further interest to learn that the Eckardt house shown in the accompanying illustration was the birthplace of a family of no less than sixteen children, and that all the sons stood six feet and over, some of them being six feet five inches. The house originally had a lower and an upper veranda. The holes above the first floor windows show where the upper veranda beams projected. The interior layout of the building is also interesting, and indicates the methods of life of our Ontario forefathers. Nearly all houses built in those days were similarly planned. On the ground floor there is a large dining-room and two bedrooms—one for the parents and one for the minister, who presumably lived with his flock, changing homes from time to time. The kitchen was generally in an adjoining room, frequently under a separate roof. The first floor was one large room, and was occupied by all the girls of the family. The top flat was also a single large room, and was occupied by all the boys. The lower part of the outside wall of the Eckardt home has been boarded in, but the old timber construction still exists behind the boards.

Our other illustrations show, one a picture of Mr. A. J. H. Eckardt, to whom we are indebted for the information published above; Mr. Alexander Fraser, Ontario Archivist, and his secretary, all standing upon one of the oak timbers of which the sawmill was constructed. The other picture is of another interesting old building in the same neighborhood, that of Webber's Hotel, at Hagerman's Hill, about a mile and a quarter south of Unionville. This also is of white pine, and was built about the same time as the Eckardt homestead.

Mr. A. E. Eckardt of the R. Laidlaw Lumber Company, Toronto, is a direct descendant of the original Philip Eckardt who is referred to in the above story.

Historic Ontario home built of white pine 124 years ago and still occupied.

Webber's Hotel, Hagermans Hill, Ont., over a century old and still well preserved.

From the Canada Lumberman of Thirty-five Years Ago

Sale of Timber Limits: Ottawa, September 20, 1881; The announcement of extensive sales of timber limits on private account brought together a large assembly of lumbermen at the Grand Union Hotel this afternoon. The following limits were disposed of:—The R. C. Campbell limit on the Front Lake branch of the Petawawa River, 39 square miles, sold to Wm. Moore, of Tarbolton, en bloc, for $29,500; Fraser & McDougall limit, berths 164 and 169 on Big Lake, River Des Moines, Quebec, 100 square miles, sold to W. G. Perley, Ottawa, for $90,000; Fraser and McDougall limit, berths 165 and 168, 100 square miles, to Alex. Fraser, Westmeath, $59,000; Fraser & McDougall limit, berth 167, 50 square miles, to E. B. Eddy, $15,500; berth 4, Deep River, 14½ square miles, to E. Moore, $4,200. The following were offered, but not sold:—Sir Francis Hinck's limit, 50 square miles, between the Coulonge and the Des Moines River, $110 per mile bid, limit withdrawn; Brannen limit, so called, offered on account of Mr. McMaster, Toronto, being berth No. 4, Kippewa, 50 square miles, $485 per square mile bid, withdrawn; berths 23, 53, and 51, Nipissing, 26 square miles each, were withdrawn, notwithstanding bids of $75,000 for the three and 50,000 for one berth. The Nipissing limit, berth 168, was offered and withdrawn. Several limits were offered for sale by Mr. Brewer, auctioneer, alternately with Mr. Tackaberry, but after spirited bidding they were withdrawn. The prices realized and offered were good.

The following limits were disposed of by Mr. Tackaberry in addition to those above mentioned: Fraser & McDougall limits, berths 164 and 169, to Perley & Pattee, for $90,000; berths 165 and 168, 100 square miles, and berth 166, 50 square miles, to A. Fraser, for $59,000 and $36,000 respectively; berth 167, 50 square miles, to E. B. Eddy, for $14,000. Deep River limit, berth 4, 14½ square miles, to E. Moher, for $4,200. Buck and Stewart limits, 13½ square miles, to Perley and Pattee, for $3,700. The following limits were offered for sale, but were withdrawn owing to the bidding not being sufficiently high; Brannen limit, on the Kippewa, fifty square miles, $495 per mile offered and refused. Lake Nipissing limits, berths 23, 43 and 51, 108 square miles, $75,000 offered for lot, and $50,000 for berth 23 and refused. Mattawa limit, license 168, sixty square miles. Kippewa limit, berth 63, 50 square miles. Mr. Brewer also offered for sale several limits, but as they did not bring the reserve price, they were withdrawn.

Resources of the Upper Ottawa

Great as are the better known resources in timber and water powers of the Lower Ottawa region, comprised within the area drained below Lake Temiskaming, they do not excel the 10,000 square miles of undeveloped country in the Upper Ottawa region, extending from Lake Temiskaming to the Grand Lake Victorian Basin.

Whilst the Lower Ottawa has for generations been pouring out its wealth of pine timber to the world's markets the Upper Ottawa has remained untouched because spruce and not white pine has always been the predominant forest there. To-day there remains very little white pine in the Lower Ottawa, or indeed anywhere in Canada. Spruce there remains in abundance, but in localities where pine has been so plentiful, as in the Lower Ottawa, the spruce is naturally not growing in such pure luxurious stands as in the regions where pine has never predominated.

Thus we find to-day the Upper Ottawa Valley, which was never much of a pine country, a rich virgin spruce forest abounding in water powers, great and small, and ready to offer up its resources at a time when the pulp and paper industry is preparing to take a world lead in Canada.

To anyone who has not cruised inland from the rivers of the Upper Ottawa the wealth of spruce is unbelievable. Casual observers of the morbid pessimist class have been known here as elsewhere to cry calamatiously, like the car window observer, because the whole timber wealth of the region did not roll out to the river banks for inspection. If the natural resources experts want to see timber, and especially spruce, it is necessary to leave the car window or canoe and get inland, usually a quarter of a mile at least, for the spring floods which overflow the banks of rivers and lakes prevent the maturing of large spruce in any quantity along shore. Besides, winds contribute towards restraining a heavy growth to the water's edge. And along railroads the laxity of control in burning right-of-way cuttings has often been responsible for long strips of burn both sides of the track. Once inland beyond the influence of these agencies the density of growth in the north country becomes evident.

In the Upper Ottawa I have found black spruce in thick growth in areas of over a hundred square miles, which, when followed in their more or less irregular outlines, will average 10 to 15 cords per acre. Some sections of 10 to 25 square miles will yield 20 cords per acre, and many localities of 100 to 600 acres contain 30 cords per acre on small sections, the number of black spruce trees of 7 inches upwards on such sections being as high as 520 to the acre.

The operating facilities of this whole region are particularly attractive owing to the possibilities of steamboat natvigation in stretches of 50 to 75 miles on lakes and rivers. The whole region of some ten thousand square miles can be reached with comparative ease, and that active operations may soon be looked for in this section is quite probable considering that some thirty million cords of spruce, exclusive of several million cords of poplar, stand ready for the axe.

All this wood may be cut, floated down and delivered, for a cost of $3.50 to $5.00 a cord, at the great water power sites of the Quinze River, situated near the Temiskaming and Northern Ontario Railway, and one hundred miles nearer markets than pulp and paper mills now operating with eminent success.

In a distance of fifteen miles from Quinze Lake to Lake Temiskaming the Ottawa (or Quinze) River can develop powers aggregating 250,000 h.p. up. Besides this, several other water powers farther up the main Ottawa can develop 5,000 to 20,000 horse-power each.—R. O. Sweezey, in the Canadian Forestry Journal.

Southern Pine Manufacturers Expect a Prosperous Year

One of the Southern pine manufacturing firms, in a recent letter to its salesmen advising them of an advance of $1 per thousand feet, to go into effect at once, expresses the conviction that 1917 will be an ceedingly active and successful year for the Southern pine industry. In order to account for these assertions the company gives the following reasons:

"First—Decreased lumber outputs:

"(a) Owing to the scarcity of labor in the North, many manufacturers have stopped the operations of their plants, and we are reliably informed that, on account of the scarcity of labor, the logging operations of many Northern manufacturers will be so crippled during the winter that there will be enforced curtailment during the entire year of 1917.

"(b) The present car shortage is also forcing a curtailment in lumber production throughout the South and Northwest. Many manufacturers have, from necessity, been forced to shut down, while most of the larger ones are pursuing a policy of curtailment necessitated by their inability to secure equipment necessary to take care of their output.

"Second—High prices of competitive materials:

"The high price levels reached during the past year by steel, cement, and other substitute materials have forced the use of Southern pine for structural purposes so that the interior demand for lumber is unprecedented. This will, without doubt, result to our benefit for years to come, as an opportunity has been afforded to put the proper grade of select structural material to test which will prove convincingly that heavy wood construction is economical, practical, and lasting.

"Third—Present prosperity of country at large:

"The present prosperity of the country guarantees civic business and individual improvement and expansion. Railroad earnings are such that carriers are now in a financial condition which will permit of immediate necessary improvements, increased terminal facilities, and increased equipment. Within the last week the Michigan Central Railroad has placed orders for 6,750 cars, approximating an expenditure of $9,000,000. The Great Northern Railway has also come into the market for 2,000 all-wood box cars. These are only two of the signs indicating that the railroads, the largest consumers of lumber, are again becoming active purchasers and consumers. Ship yards which have lain dormant for years are now running to full capacity, and have firm business in hand to take care of their output for the next year and a half to two years."

The determination of the Quebec Government to prevent the careless setting of fires in the forest was illustrated at Mont Laurier recently, when Judge C. B. Major inflicted fines and imprisonment on four settlers who had defied the permit law requiring them to obtain a written permit before burning their slash. Fines of $30 and costs, $25 and costs, and $25 and costs, or terms of 24 days and 15 days' imprisonment, were imposed upon three settlers, who chose to pay their fines. In the fourth case a fine of $25, or 15 days in jail, was imposed, and the settler chose the term in jail. These prosecutions were all commenced by the Lower Ottawa Forest Protective Association.

The 230th Forestry Battalion, which is now comfortably located in winter quarters at Brockville, Ont., is receiving new recruits daily from all parts of the country. This battalion will be sent to France to cut lumber, and will relieve soldiers now engaged in similar work, thus permitting them to go to the front. The 230th will not be sent to the firing line.

Preservation of Fir Stringers and Ties

Coal Tar Creosote Penetration of Douglas Fir Secured by Special Methods Without Injuring Strength of Timber

By O. P. M. Goss*

The creosoting of Douglas fir on the Pacific Coast has been practised for more than twenty-four years, and has proven an unquestioned success. Douglas fir is a difficult wood to creosote, and for this reason it has been necessary to give it special study in order to get the results which are possible to-day. It has been necessary in treating this wood to modify methods of treatment which have been successfully used throughout the eastern portion of the United States.

Both the boiling and steaming processes have been used in creosoting the various forms of Douglas fir. These methods have given excellent results in the treatment of piling and other forms, in which a loss in strength of the wood of from 30 to 40 per cent., due to the treatment, is not objectionable. The greatest objection to these treatments has been the loss in strength which they have caused when treating such forms as bridge stringers, ties, or other similar forms in which it was necessary to retain practically the full strength of the wood after treatment.

The United States Government began a series of tests about nine years ago to determine the effect on the strength of creosoting Douglas fir bridge stringers by the boiling and steaming process. Results of these tests are published in United States Department of Agriculture Bulletin No. 286, and show that the loss in strength in these forms, due to these treatments, ranged from 33 to 35 per cent., based on the modulus of rupture.

It is well known among those familiar with Douglas fir that it is a structural timber of the very highest merit. It has been used for construction work for practically every conceivable class of construction, and, because of its wide application, it is particularly desirable to develop processes of creosoting which are thoroughly effective and which do not cause any material loss in the strength of the wood.

The tests above referred to, which were made by the United States Government, showed the necessity for concentrated study on the subject of creosoting Douglas fir. This matter was taken up by the Association of Creosoting Companies of the Pacific Coast and by the West Coast Lumbermen's Association, and a large amount of experimental work has been conducted in an effort to develop the most satisfactory treatment for this timber. Acknowledgement is made of the co-operation given in this work by the Forests Products Laboratory, Madison, Wisconsin, and the Seattle Timber Testing Laboratory, both of the United States Forest Service and the University of Washington, Seattle, Washington.

High Temperatures Injurious to Strength.

Results of past experiments have indicated that the application of high temperatures was unquestionably one of the causes for the loss in strength in creosoting Douglas fir. In the application of the old boiling process the temperatures commonly ranged from 230 degrees F. to as high as 260 degrees F., and the seasoning period lasted approximately 24 to 36 hours. The application of these high temperatures for such long periods of time was unquestionably injurious to the strength of the timber. Briefly, the old boiling process was applied about as follows:

"The timbers were placed in the retort in a green condition and boiled in creosote oil under atmospheric pressure for 22 or more hours, at a temperature ranging from 230 to 260 degrees F. This boiling period was used to season the timber and properly prepare it for receiving the oil. When the boiling period was completed, pressure was applied, rising from zero to as high as 145 to 185 pounds per square inch. The pressure was continued over a period of four to six hours, at a temperature of approximately 200 to 230 degrees F. By this method 10 to 14 pounds of oil per cubic foot was injected into the wood."

The steaming process of creosoting requires higher temperatures than the boiling process, but they are applied for a shorter length of time. The following description gives some idea regarding the various operations involved in creosoting Douglas fir by the steaming process:

"The timbers were placed in the retort in a thoroughly green condition and steamed at a pressure of approximately 90 pounds per square inch for a period of four to seven hours, at a temperature ranging from 325 degrees to 335 degrees Fahrenheit. A vacuum of approximately 20 inches was then applied for 18 to 20 hours while the temperature ranged above 220 degrees Fahrenheit. At the end of the vacuum period creosote oil was introduced and pressure applied, ranging from zero to 160 pounds per square inch. This pressing period continued for two to four hours, at a temperature of approximately 208 degrees Fahrenheit. By this method 10 to 14 pounds of oil per cubic foot was injected into the timber."

* Consulting engineer for the West Coast Lumbermen's Association.

In both the boiling and steaming processes the temperatures applied are high enough to injure to some extent the fibre of the wood. These processes when applied to piling or other forms in which some loss in strength is permissible have given good results where the treatments have been applied in accordance with the best practice. In such forms, however, as ties and bridge stringers, in which it is necessary, in order to get the best service from the timber, that it retain practically its full strength, these processes have not proven entirely satisfactory. Because of this fact special efforts have been made in order to develop a treatment which would be effective and which would not prove detrimental to the strength of the timber.

Boiling Under a Vacuum.

Experiments were made on material creosoted by the Barry process, which involves heating the timber in a partial vacuum for the purpose of seasoning before the oil is introduced into the cylinder. This treatment did not involve the use of high temperatures, and consequently resulted in but a very slight loss in strength of the timber. It did not seem, however, to prove effective in uniformly seasoning a large charge of material. Apparently the transmission of heat through the partial vacuum was not effective, and the results in general seemed to indicate an ununiform seasoning of material. The material which was placed adjacent to the heating surface was unusually well seasoned and received a good oil penetration, but that taken from the centre of the charge would not seem to receive anything like the same degree of seasoning. These experiments indicated that the medium used for transmitting the heat as would naturally be expected was not effective. The next logical step seemed to be to season the timber under the same low temperatures used in the Barry process and to introduce some medium which would transmit the heat directly to all surfaces of the material being treated. In an effort to accomplish this result the boiling under a vacuum treatment was applied. This treatment is a slight modification of the old "Boulton Process," and has given excellent results in the treatment of bridge stringers or other heavy timbers subjected to cross-bending tests. This method has for some time been practised by the Colman Creosoting Company, of Seattle, the only difference being that the boiling was done under a low vacuum of 10 to 12 inches, which is less effective than the higher vacuum. This treatment is now applied at the various plants on the Pacific Coast about as described below:

Boiling Under a Vacuum Process.—The timbers are placed in the retort and creosote oil introduced at a temperature of 160 to 180 degrees F. Heat is applied and the temperature of the oil gradually raised to 190 degrees and held at this temperature for from five to six hours, a sufficient length of time to warm the timbers through. When the timbers are thoroughly warmed a vacuum of 24 to 27 inches is drawn on the oil, still maintaining a temperature of 190 degrees F. This vacuum is drawn through an overhead pipe extending from the top of the retort 36 feet vertically into the air and returning to the condenser. The purpose of this pipe is to prevent the creosote oil from boiling over into the condenser during the vacuum period. This vacuum is started at approximately 18 inches and, as the timber seasons, is gradually raised to 24 to 27 ins. The full period of vacuum is 12 to 16 hours. It is continued until the rate of seasoning of the timber is 1/10 of a pound of water per cubic foot of wood per hour.. After this finished rate of seasoning is reached the vacuum is broken and pressure

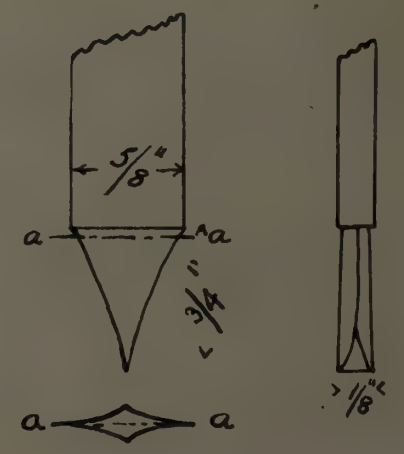

Fig. 1—Tool for perforating ties before treatment.

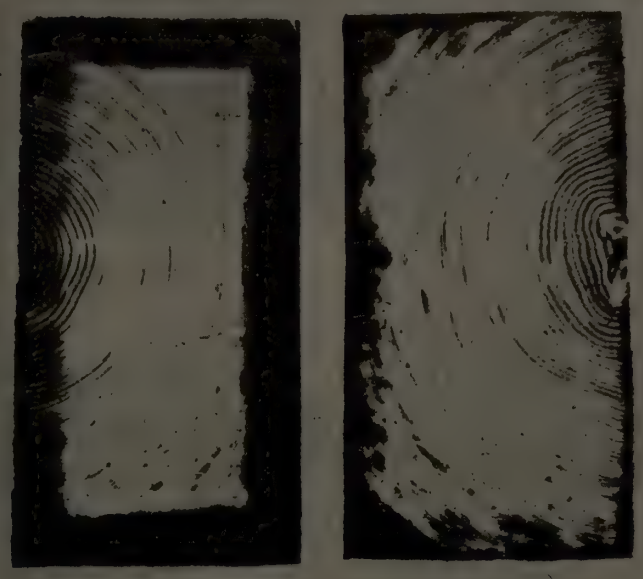

Fig. 2—Creosote oil penetration in perforated (left) section and unperforated (right) section of Douglas fir ties.

on the oil started, which rises as high as 120 to 135 pounds per square inch and continues over a period of four to six hours. The temperature of the oil during this pressure period drops from 190 to 180 degrees F. By this process 10 to 14 pounds of oil per cubic foot may be pressed into the wood."

Bridge Stringers.—In order to test out the efficiency of creosoting by the boiling under a vacuum method two shipments of green bridge stringers were selected and creosoted in four different charges. These stringers were shipped to the Bureau of Standards, City of Portland, for test. The stringers were selected in long lengths and were cut in the centre, one half being creosoted and the other half tested in its natural condition. The two halves of the stringers were as nearly equal in quality as it was possible to obtain. The results showed practically no loss in strength in the creosoted material.

Railway Ties.—The large volume of lumber used for railroad ties has seemed to warrant a very careful study of this subject. Accordingly, the lumber and creosoting associations have devoted considerable study to this subject, and have made a large number of experiments, both independent and in co-operation with some of the railroads, in an effort to develop the most satisfactory method of preparing and creosoting Douglas fir ties.

An untreated tie in the track is serviceable only up to the time when it develops weaknesses due to decay. From this time on it becomes worthless very quickly. This is largely due to the fact that a tie in the track is subjected to very heavy stress under normal traffic in compression perpendicular to the grain. The mechanical life of a Douglas fire tie untreated is probably at least fifteen years under normal railroad traffic. Such ties, however, in service last only six or seven years, due to decay, which eventually entirely destroys the tie. Douglas fir has the required strength to give long life in the roadbed when used as a tie, provided it is possible to prevent the development of decay. The experiments which have been made to date have aimed at two principle objects:

Machine designed to perforate Douglas fir railway ties before creosote treatment.

1. To prolong the natural life of Douglas fir ties by preservative treatment.

2. To apply the preservative treatment effectively without material injury to the wood fibre.

If the above points are accomplished it is certain that a greatly increased length of life will result from the use of Douglas fir ties.

Perforation of Railway Ties.

In investigating this subject an effort has been made to take advantage of the fact that creosote oil enters wood along the fibre with very much greater ease than in any other direction. The idea was, therefore, conceived by the writer to perforate the timber to provide a means of controlling the distribution of the creosote oil. This same thought had come to others, and Mr. B. Kuckuck made some tentative experiments in co-operation with the St. Helens Creosoting Company, of Portland, Oregon, about 1913. The perforations used were made by means of a drill, which bored a small hole about 1/16 inch in diameter.

It has been found that more satisfactory perforations may be made by punching the holes rather than boring, and by making perforations at short intervals it is possible to get a thorough penetration of oil in the timber equal to the depth of the holes without subjecting it to a severe treatment. A tool which seems to give good results is shaped as shown in Fig. 1. It seems necessary to cut the fibre of the wood in order to get complete distribution of oil with a mild treatment.

A machine was designed and built by the Columbia Creosoting Company, of Portland, Oregon, for perforating ties. This machine runs at a speed of about 70 per minute, and will perforate ties as rapidly as it is possible for laborers to handle them. The vertical rolls perforate the sides and the horizontal rolls the top and bottom faces. (See illustration.) The ties should, of course, be bored for spikes before treatment.

A good spacing for the perforations arranges them so that it is only necessary for the creosote to pass along the grain a distance of 3½ inches and across the grain about 1/16 of an inch from each perforation in order to give complete penetration on all faces of the tie to a depth equal to that of the perforations. The size of the perforations is approximately ⅛ inch across the grain.

The question as to the effect of perforating upon the strength of the wood came up immediately for consideration. For the purpose of securing reliable data on this subject strength tests were made on ties in both the natural and treated condition.

Thirty-one air-seasoned ties were selected for carrying out these experiments. The ties were of the ordinary grade, and were selected so that all tests were made on clear material and in such manner as to eliminate entirely the influence of defects. These ties were all tested in compression perpendicular to the grain. A steel plate 6 in. x 10 in., 1 in. thick, was placed across the face of the tie, covering an area equal to 60 square inches.

A section three feet long was cut off one end of each tie and tested in a natural condition. One half of the remaining section was perforated to a depth of three-fourths of an inch on all faces, in accordance with the spacing referred to above. This six-foot section was then placed in the retort and the following creosote treatment was applied:

The ties were heated in creosote oil under atmospheric pressure at 170 degrees F. for four hours. Approximately 100 pounds pressure per square inch was applied on the oil for three hours, at a temperature of 170 degrees F., after which the oil was drained off and a final vacuum of approximately 24 inches was drawn for one-half hour.

After treatment the ties were tested by the writer. These tests showed that there was no loss in strength, due to the creosote treatment, as shown by the average results, and also that the perforations made in the ties before treatment had no detrimental effect upon the strength. Fig. 2 shows the effectiveness of the perforations in securing uniform distribution of oil in three of the ties. Perforated sections show a uniform penetration to a depth slightly deeper than the depth of perforations, while the unperforated sections show very slight and ununiform penetration in comparison. These results indicate the possibility of gaining marked increased efficiency in the use of railway ties when creosoted by the method above indicated. The principal reason for the fact that no loss in strength occurred is that by means of the perforations it is possible to secure an effective penetration and distribution of the oil without the use of a severe heat or pressure treatment.

A good method for preparing railroad ties of Douglas fir is as follows:

Cut ties in winter and early spring. Perforate and openpile for air-seasoning, taking advantage of the summer months. The ties may then be creosoted in the early fall and winter or at any later date. Handling ties in this way will insure an absolute protection against decay, and will enable the wood to be creosoted without loss in mechanical strength. These two points will insure the greatest value possible in the way of service from this form of material.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Wanted to Buy

Maple Squares 18 inches to 48 inches long; 1 in., 1¼ in., 1½ in., 1¾ in., 2 in. and 2¼ in. squares.—Apply to A. K. Hansen & Company, Quebec. Que. 20-t.f.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted

Wanted 600 piles, 50 ft. long, 6 in. tops; 200,000 feet log run basswood; 150,000 3-inch spruce to be shipped during the winter. Will pay cash as soon as cut or will advance money to make the cut. H. V. BERRY, Fort Plain, N. Y., U.S.A. 22-23

SPRUCE MILLS

Inquiries for next season are coming in. I have market for your sawing of 1917. All or any part. If interested write me fully.

EDWIN D. HOWE,
P.O. Box 384 Valatie, N. Y.
23-2

WANTED

Large quantity of maple, black birch or hickory plank cuttings, 6 in. x 6 in., also 7 in. x 7 in., all 1¾ in. thick, must be dry and sound.

Also several carloads maple, beech or birch squares, 1 in. to 1¼ in. x 3½ ft. to 4½ ft. in length.

J. FINLAY & SONS CO.,
23-4 Norwood, Ont.

For Sale–Lumber

For Sale

Pine, Birch, Spruce, for Sale, suitable for shell box manufacturing. Apply The Office Specialty Mfg. Company, Limited, Newmarket, Ont. 22-24

For Sale

Two cars 1½ in. and two cars 2 in. White Pine, good sidings, extra widths and lengths.

KNIGHT, WHALEY CO.,
23-23 Guelph, Ont.

For Sale

CEDAR POSTS—Ready for immediate shipment. 2,000 sound Cedar Posts, 3 in. to 6 in. diameter tops, 9 ft. long, unpeeled. Inquiries solicited.

BARTRAM BROS., LIMITED,
22-23 Ottawa, Ont.

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
875 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale–Machinery

Logging Tractor

For sale one Gasoline Lombard Log Tractor, four cylinder engine. Low price. Randolph & Baker, Limited, Randolph, St. John Co., N. B. 23-24

For Sale

Goldie & McCulloch Corliss Engine, 16 x 38, 150 horse power; Berlin Matcher, No. 90, good as new; Grand Rapids Engine and Generator for 150 lights.

R. LAIDLAW & CO.,
22-2 Toronto, Ont.

For Sale

Fifty H.P. Waterous Boiler (Locomotive type) with 11 in. x 12 in. engine mounted on same. In first class shape and ready for immediate shipment. Apply to Peterborough Canoe Company, Limited, Peterborough, Ont. 23-2

Machinery Wanted

If you have any machinery for sale right here in this column is the place to advertise it. Every man who reads here is looking for a machine—if you have that machine you can do business. Let us quote you on an ad. 20-23

MACHINERY FOR SALE—One pair carriage sett works, with shafts and spring, Wm. Hamilton make. One Lath Mill. One Bolter. All in good condition and cheap.

Papineauville Lumber Co., Ltd.,
2[illegible]-1 Papineauville, P.Q.

FOR SALE

1—Wicks Gang.
1—Ideal Engine, 13 in. x 12 in.
1—Plain Engine, 16 in. x 24 in.
1—Plain Engine, 5 in. x 7 in.
1—Boiler, 72 in. x 16 in.
1—Boiler, 54 in. x 12 in.
2—Upright boilers.
1—Cookston water heater.
Several steam pumps.

CHAS. PEDWELL,
16-t.f. McVicar, Ont.

FOR SALE

We have the following second hand machines to offer, ask us about others not listed, if you are interested.

1 Egan 30 in. 2 drum sander.
1 McGregor Gourlay 30 in. 2 drum boss sander
1 Jackson Cochrane 36 in. 3 drum sander
1 Egan 42 in. 3 drum sander
1 Cowan 42 in. 3 drum sander
1 Cowan 48 in. 3 drum sander
1 C. M. C. 8 in. 4 side sticker
2 Ballantyne 12 in. 4 side stickers
1 Egan 36 in. single surfacer
1 Harper 26 in. single surfacer
1 Cowan No. 220 24 x 10 single surfacer
1 McGregor Gourlay QY 15 in. planer and matcher
1 McGregor Gourlay QY 9 in. planer and matcher
1 Jackson Cochrane 54 in. band resaw, 5 in. blade
1 Jackson Cochrane No. 165 rip saw

P. B. Yates Machine Co., Limited
Hamilton, Ont.
19-t.f.

Wanted–Machinery

Lumber Trucks

Wanted twenty-five, more or less. Must be in good condition. Iron wheels, 40 inches in diameter; 5-inch tires preferred.

Apply, E. D. McCallum, Drummondville, Que. 23-2

Machinery Wanted

1 Tongue and Grooving Machine.
1 Butting Swing Saw Machine.
1 Swing Shingle Machine.

All for heading mill.

C. B. Janes & Company, Limited,
23-t.f. Orillia, Ont.

Dutch Ovens Wanted

Wanted two Dutch Ovens, suitable for boilers 60 in. x 16 ft., or two boilers of about 75 to 100 H.P., equipped with Dutch Ovens. State price f.o.b. cars.

Trenton Cooperage Mills, Limited,
23-2 Trenton, Ontario.

Burner Wanted

Wanted, Secondhand Standard Steel Burner, 20 to 25 ft. in diameter. Must be in good condition. Give full description with price, and state where same could be delivered in case of purchase.

FRASER LIMITED,
21-24 Fredericton, N. B.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

A YOUNG MAN wishes to make a change. Buying or Sales force preferred. Fifteen years in inspection work. Both rail and water shipments. Box 476, Canada Lumberman, Toronto, Ont. 22-24

MARRIED MAN, THIRTY YEARS OLD, ten years' experience in office work as Accountant, speaking both languages, desires to change, best of references. For particulars write to P. O. Box No. 69, Three Rivers, Que. 16-24

Practical woodsman and millman wants position. College education, both languages; seven years' experience, last three managing mill, seventy-five men. Best of references. Will go anywhere; salary dependent on results. Box 481, Canada Lumberman, Toronto, Ont. 23-24

ONTARIO LUMBERMEN owning Timber and Mills in British Columbia. Now is the time to operate. B. C. Mills cannot supply the demand. Prices highest and going higher. Manager large company in Interior B. C. will be available February 1st; twenty-five years' experience; will get results. Not operating on account of death of owner. Address 479, Canada Lumberman, Toronto, Ont. 22-23

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED — TROROUGHLY COMPETENT MANAGER to take charge of mills and limits in province of Quebec. Must be able to speak French and English and be thoroughly capable, from stump to mill. State fully experience, present position and salary required. Address Box 475, Canada Lumberman, Toronto. 22-t.f.

SALESMAN WANTED by large British Columbia shingle mill, to sell shingles on a commission basis. Must be able to handle large output. Apply Box 477, Canada Lumberman, Toronto, Ont. 22-23

Business Chances

For Sale

Twenty acres Elm and Basswood, also 40 acres of Virgin Cedar near station. S. A. Price, 71 Lakeview Avenue, Toronto, Ont. 20-23

For Sale

Planing Mill and Lumber Yard in Town of Sudbury, Ont. Electric power, 40 h.p. motor, planer and matcher, surfacer, rip-saw and dado saws, sticker, circular resaw, cross-cut saw, turning lathe, mortiser, tenoner, borer, sander, sash and door clamp, shaving baler, automatic knife grinder, fan and blowing system, knives, etc. Mill now running, dressed lumber buildings, barn. No better location in town. Splendid rail facilities, and no doubt the best thriving town in Ontario.

Address, Box 457, Canada Lumberman, Toronto, Ont. 18-t.f.

WANTED

Large manufacturers of wooden ware and other wood products selling to hardware stores, want to buy out the business and good will of some manufacturer having a line closely related to the above. Send particulars to Box 482, Canada Lumberman & Woodworker, Toronto, Ont. 23-2

Valuable Box Factory For Sale

The undersigned will receive offers for the purchase of that valuable property known as the

Czerwinski Box Factory

situated on Logan Ave. and Tecumseh Street, Winnipeg, Canada. This property comprises what is believed to be the finest box factory in Western Canada, fully equipped with the latest and best machinery for box manufacturing and ready for immediate operation. It also includes the factory site, consisting of about 2½ acres of land close in to the business centre of the city, and possesses unexcelled trackage facilities. Street cars pass the factory door. This is a magnificent opportunity for any person wishing to engage in box manufacturing. The whole may be purchased at a very great bargain.

Further information may be obtained upon application to

H. E. DENEEN,
Assignee of the Czerwinski Box Co., Ltd.,
300 Electric Railway Chambers,
22-t.f. Winnipeg, Man.

FOR SALE TIMBER AND MILLS

The undersigned offer for sale in one or separate blocks their timber and mills situated on the Crow's Nest Pass Railway, B. C., viz:—

About 12 square miles near Cranbrook, B. C., well wooded with larch, fir, etc., and a mill in good working order, capacity forty thousand feet.

On Lamb Creek, near Moyie, B. C., 12 square miles, heavily wooded with white pine and large spruce.

At Yahk Station, 4,551 acres Crown granted timber land, also about 7 miles white pine, larch and spruce, and a mill with a capacity of sixty thousand feet.

At Cranbrook the company own an up-to-date plant equipped with good machinery, where, under a favorable arrangement with the C. P. R., the output from different points named can be assembled and dressed ready for shipment.

The above timber all being in close proximity to the C. P. R. and the distance to the Alberta boundary being about 100 miles, gives the producer an advantage over the Coast mills, saving from $2.00 to $5.00 per thousand feet in freight alone.

The King Lumber Mills, Limited,
23-1 Cranbrook, B.C.

For Sale—Controlling interest in a Saw and Planing Mill, capacity 25,000 feet. Could be increased considerably. Mill on rail and tide water. Unlimited timber supply. For particulars apply to R. H. Young, Squamish, B.C. 21-24

Miscellaneous

Sleighs For Sale

Twenty-five sets logging sleighs, in good condition. The Peterborough Lumber Company, Limited, Peterborough, Ont. 20-1

For Sale

One hundred square miles of Pine and Spruce limits well situated on the St. Maurice River, on which at least 400,000,000 feet of lumber will be found. Price $350,000, payable $150,000 cash and the balance in four annual payments, with interest at 6 per cent. For full particulars apply to La Cie des Bois du Nord, 71a St. James Street, Montreal. 21-24

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of February, 1917, for the right to cut pulpwood and pine timber on a certain area situated on the Black Sturgeon River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure, for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for ten thousand dollars ($10,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $10,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Toronto, 1916.

N.B.—No unauthorized publication of this notice will be paid for. 21-22

TIMBER ESTIMATES
Appraisal of timber lands, timber maps, logging efficiency reports, planting. Maximum of accuracy in minimum time and at minimum expense.

Review of Current Trade Conditions

Ontario.

The lumber trade in Ontario continues to show encouraging improvement. Reports to this effect are received from all quarters—manufacturers, wholesalers, and retailers—and the only drawback at present is the difficulty in obtaining stocks, resulting from two principal causes—first, the shortage of labor at the mills, and, second, the difficulty in making shipment as a result of labor scarcity for loading and unloading cars. For a time this situation led to an embargo upon C.P.R. shipments to Toronto, and no car lot shipments were made during the first two weeks in November. This embrgo, however, was subsequently raised, and shipments are again being made. Shipments of stock from Uinted States points into Ontario are very light, on account of the great scarcity of cars existing across the border.

In Ontario the improvement covers practically all lines. Hemlock manufacturers are asking $19 to $20 for No. 1 hemlock, good size, and $21 is being suggested. Delivered at Toronto, the prices would be about $21.50 to $22. This brings the price of hemlock to a level where it may find considerable competition from Southern yellow pine, which is offered, delivered at Toronto, at $21.75 to $23.

Further reports which we have received from manufacturing points corroborate the opinion already expressed that from now on we may look forward to a continually increasing shortage of stocks at mill points, which is certain to result in higher prices between now and next spring if the demand continues at all active. The improvement during the past month has been the result of retailers becoming convinced that the market is definitely on the upward trend and that they will be saving money by buying at present. This has brought about an extensive buying movement, which is likely to continue until the end of the year, when a falling off in the demand may be expected. The trade will then probably continue on a more or less quiet basis until the spring demand makes itself felt. The situation, then, is one which it is impossible to foretell at present, but it is quite safe to count upon a shortage of stocks and firm or high prices throughout the first half of next year, until new stock is ready for the market. These conditions apply to everything that is produced in the lumber line in Ontario.

There is practically no change to report in the hardwood situation. Canadian stocks are firmly held and are light. American hardwoods are in much the same condition, and the prospects for obtaining further supplies with any regularity are poor, on account of the car shortage. Ontario exporters to Great Britain report that the freight market is again advancing. Very little space is offering, and shipping companies are now asking 325 shillings per standard.

Ottawa manufacturers report that trade is more active than it has been for some time past. The building situation in Ottawa has also shown improvement, several large buildings having been started recently. The export trade is very quiet. Logging operators are having continued trouble in regard to securing men for the woods, although they are offering higher wages than ever before.

Eastern Canada.

The steamer shipping season from St. John, N.B., is now commencing, several steamers being due for cargoes for the allied governments. It is expected that large quantities will be sent forward this winter, extensive sales having taken place. Prices continue firm. St. John stocks are not very heavy, as some of the mills were idle nearly all summer and others only ran for part of the summer. About 20,000,000 feet of deals are on the wharves at St. John and much of this is long stock for the American market. Practically all the St. John mills will be closed down within the next few days. Stocks of logs carried over will be light, only about 15,000,000 feet. Men are very scarce for logging operations in the bush. Many operators are putting in portable plants and sawing their logs in the woods. Stocks of spruce boards, planks, and narrow widths are practically off the market. There is a good enquiry from United States and Ontario points, the latter being mostly for shell box material. Lath are very strong, and are selling at New York to-day at $4.50, and $5 is expected before long. Nearly all shingles at St. John have been cleaned up.

New contracts for shell boxes have been received by a number of Montreal firms, most of the contracts being in the neighborhood of 40,000 boxes each. The building trade has been improving considerably, a number of important contracts having been let, both in Montreal and outside points. Many lines of lumber are very scarce, and the shortage of cars is making it difficult to obtain sufficient stocks. The improved demand has stiffened nearly all prices, and further advance is expected. Improvement is also reported in the United States trade, and it is expected that this will continue.

The Eastern spruce market at Boston continues strong. Quotations for spruce frames are on a $29 base, and are firmly held at that. It is generally thought that spruce quotations will go still higher during the present year. Random is also stronger and quotations are firm at the following range: 2x3, $23; 2x4, $24; 2x5, 2x6, and 2x7, $23; 2x8, $27; 2x10, $28 to $29; 2x12, $29 to $30. An embargo against Southern lumber by the railroad companies has improved the demand for Eastern boards. Spruce covering boards 5 in. and up wide, 8 ft. and up long, are bringing $21.50 for good lines. Matched boards, stock lengths, are selling at $24 to $25. A firmer market is reported at Boston for hemlock. Clipped hemlock boards are bringing $21.50 and $22, while some manufacturers are talking of $22.50 and $23. There is also a good market for hemlock plank. There is a steady enquiry for shingles at Boston, but the actual volume of trade is not large. Quotations are rather firm on the basis of $3.50 to $3.60 for clears. Lath are still strong, selling at $4.50 for 1⅝ in. spruce and $4 for 1½ in.

Great Britain.

Improvement is reported in the spot market in Great Britain for Canadian pine, both the demand and prices having stiffened. This is the case prticularly in connection with the lower grades, but there has also been improvement in the demand for first and seconds. Stocks of Canadian pine in Great Britain are low, and anything like a normal demand would cause a serious drain upon them, especially in view of the fact that stocks in Canada are also low and the cut is not expected to be large. The situation, together with the advancing freight rates, makes English holders of pine feel well satisfied. There is also a good demand for birch planks, and prices have advanced. Birch logs, however, are not in much demand at London. Stocks of rock elm in Great Britain are low, and there is a good demand in most parts of the country. Generally speaking, the spot market at London has not shown much alteration, but deliveries are up to the average, and the demand is steady and fairly strong. Values are showing a tendency to advance in all directions.

There is a strong demand for boards, both planed and unplaned, and arrivals have been reported regularly in spite of the large number of vessels that have been sunk. There is a marked shortage of deals, battens, and flooring boards, but stocks of unplaned boards are about two million pieces above normal. At Foy, Morgan & Company's recent auction sale a lot of clear silver spruce from Portland, Oregon, brought £42 per standard for 1x10 and 1x12.

At Liverpool the c.i.f. business recently has been quiet, but the undertone has been good. Improvement is generally expected, as enquiries are being received from numerous quarters regarding liner shipments. Contracts for such goods are at advanced prices on account of increased freight rates and the higher cost of production in Canada. Information regarding the amount of space likely to be available by liners is difficult to obtain. Stocks that have been landed for shippers' account are well held, and are likely to be in good demand. The hardwood market at Liverpool during the past month has been better than was expected. Prices advanced and spot quotations were always below shippers' prices for further supplies. Sales for consumption have increased in comparison with visible supplies. Rock elm has recently been included in the list of prohibited imports. Elm was formerly included, but rock elm is specifically mentioned now in order to remove any misunderstanding. The spruce situation at Manchester has been improving. The low prices of Baltic timber were a drag on Canadian goods for some time, but this condition has now changed. There has been a heavy decrease in the consumption of Quebec waney pine logs, birch logs, and spruce deals at Manchester, but good business is reported in Quebec elm logs. Most lines of stock at the end of the present year will be in excess of those of a year ago.

The general improvement reported recently is still maintained. Higher prices have not reduced the volume of consumption, which is still slightly on the increase. It is not thought that any downward movement can be expected until the end of the war is in sight. The demand for the better grades of pine deals continues quiet.

United States.

An indication of the prosperity and industrial activity of the United States is afforded by the building returns. During the month of October gains in the value of new buildings for which permits were issued were reported from 74 cities out of 111, as compared with October of 1915. There is also an excellent demand from the railroad companies for construction material and car building material. An increase is reported in the demand for wood block paving; also in the demand for mill construction timbers, while the demand for export material is steadily increasing. Unfortunately, although increased

demand is reported from practically every quarter, manufacturers are still hampered by the great scarcity of cars. The whole outlook for the lumber trade is promising, so soon as the car shortage situation shows improvement. The Southern pine situation continues very strong, and the recent advance of $1 a thousand in the price has been easily maintained. The chief factors in this situation are a steadily increasing demand and the determination of manufacturers to keep their production well down. Since the first of November some of the larger manufacturers have notified their salesmen of three successive advances in price, all of which have been well maintained. Manufacturers are now confidently expecting that the trade will continue strong at least for the balance of the year.

Reports from the West Coast show continued curtailment of production, the extent being 12.34 per cent. The Pacific Northwest is feeling the car shortage more severely than other parts of the country. The demand continues good, nd increased orders are reported from numerous quarters. Although stocks at mill points have increased on account of the car shortage, most of the unshipped product is well covered by orders. The extensive shipbuilding developments in the Western States and British Columbia give promise of early relief from the shortage of vessels for shipment by water. At present there are 53 wooden vessels under construction at Pacific Coast points, which are consuming approximately 106,000,000 feet of lumber, and contracts have been let for 11 others.

In the hardwood markets improvement is reported in the demand for oak, both plain and quartered, and prices have advanced. There has, in fact, been a general improvement in the hardwood situation. There is a strong demand for mixed stock in all Northern hardwoods, and stocks at mill points are being reduced. Maple and elm have been affected strongly by this situation, and considerable advances in price have been the result. Piano and automobile industries are buying large quantities of maple and elm. The trade in basswood continues quite active, and there is also a satisfactory movement of birch.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Strong Demand for St. John Stocks

St. John, N.B., November 24.—(Special to the Canada Lumberman.)—The movement of lumber at the Port of St. John has not as yet commenced, although the next few days will see the beginning, as some steamers are now due for cargoes for the allied governments. No doubt large quantities will be sent forward during the winter, as large sales have taken place. Prices for present and future deliveries remain very firm, without any weakening influence, so far as can be seen at the present. Stocks are not heavy at St. John, many mills having been idle nearly all summer and others only running a short season. There are probably not over 20,000,000 feet of deals on the wharves at St. John, included in which are many deals sawn for the American market, but which are of sizes that can be diverted into the English market. A goodly quantity of these long American deals have been sold at very high prices, going to the allies for trench and sundry war material.

No sales for next season have taken place within the last two weeks, as a great many of the mills sold some time ago. Within the next two weeks all the mills at St. John will be idle. No large stocks of logs will be wintered. Probably in the vicinity of 15,000,000 feet will be carried over, a good many of which are double-length logs. Logging is now in full swing all over the provinces. Men are extremely scarce, wages being little inducement to get them to go to the woods. Any person who can get a portable mill is planning to saw the logs right in the woods and haul out the sawn timber; but even though many are planning cuts, unless labor can be found, the cut will no doubt be below normal. While the operators are crying out that logs will cost more, it is almost impossible to say at this date what the extra price will be.

No stocks of spruce boards, planks, or narrow widths are available. Enquiries are coming very freely from the American market and also from Ontario points. Large quantities of shell box orders are held by Upper Canadian concerns, who are looking around for supplies, but unable to find them at any price.

The base price on the Boston market is steadily improving, and before many days will have reached $30 per M., and that may not be the high point. Random is being sold at from $26 to $27 per M., f.o.b. Boston points. New York is fully as good as Boston.

Vessels for coastwise business are extremely scarce, and therefore little movement is taking place coastwise.

Laths are improving steadily and, if freights could be had, large quantities would move out. The price to-day is $4.50, New York, and will no doubt reach $5 before long, which will be an unprecedented price. Shingles have all been cleaned up at St. John. Only a few ex. No. 1 remain.

Further Improvement in Montreal Trade

Montreal, November 25.—(Special to the Canada Lumberman.)—The placing of several new contracts for shell boxes has helped to maintain the improvement in the lumber trade. The contracts, as a rule, run to about 40,000 boxes for each firm, at varying prices, and the orders are well distributed. There is also a much better demand by contractors, who have lately secured large contracts for Montreal and more particularly for outside points. A considerable amount of buying for these jobs has been done in the city. Ammunition plants and extensions to industrial plants figure conspicuously in the new work. Building is particularly active in the province, and this has also been a factor in the situation.

There is, however, a continued scarcity of certain lines of lumber, and many enquiries addressed to the mills bring answers to the effect that there are no such sizes available, or that they are sold out of stocks. This condition is aggravated by the small supply of cars at points where lumber is obtainable. Quotations have advanced under the stimulus of the better demand, and it looks as if they will go still higher. Manufacturers are asking more money in the new contracts now being made, and one large firm states that the cost of producing pine lumber will run into about four dollars per 1,000 feet, due to the increased labor cost and expense of maintaining camps.

Trade with the United States is satisfactory, and the immediate outlook is favorable for a continuance of this condition.

The export season is now about finished. As usual at this period of the year, every effort was made to send across as much as possible, but tonnage was so scarce that a large quantity of lumber had to be shipped via Portland. During the last week not an inch of room could be obtained, owing to the enormous number of parcels for the United Kingdom and France. Freights at the winter ports will probably be very stiff, and 325s. have been refused by the steamship companies, with indications that a much higher level will be reached.

Pulp and paper conditions are unchanged. The demand is as brisk as ever, and contracts have been entered into for very large amounts for next year—one company has sold practically all its sulphite output in 1917 at exceptionally good prices. The ground wood position is still good. Next year will witness a substantial addition to the production of sulphite and ground wood, as new mills and extensions to existing plants are now in the course of erection. The Wayagamack Company is adding to its pulp mill. The price of pulpwood has, in consequence of the increased demand, advanced so much that some lumber manufacturers have decided in 1917 to devote their energies to this branch of the industry and to cease sawing logs.

Ottawa Trade Improving

Ottawa, November 25.—(Special to the Canada Lumberman.)—More business has been done this month by the lumber manufacturers of Ottawa than during all summer and fall. Manufacturers all have the same story—all are busy.

Within the last month contracts aggregating about $100,000 have been divided among local manufacturers for shell boxes. These are mostly made of pine and spruce, and the mills have had a great run on these two varieties. This work has caused most of the increased business.

Another factor contributing to better business is that several large buildings have been started in Ottawa, and the demand for material has caused the manufacturers to be fairly busy getting it out. The local demand otherwise, however, is quiet.

There is very little export trade in progress. It is difficult to secure space, and freight rates are also unusually high.

Operations in the camps are well under way. It is becoming very difficult to get men, although the scale of wages was never higher.

Prices of lumber continue to advance, particularly pine and spruce.

New York Lumber Prices

Simpson, Clapp & Company, New York, N.Y., report under recent date as follows:—The timber market here has been holding firm with a tendency to advance on certain sizes. Spruce at $25 or better has been readily obtainable for what few two-inch random cargoes have been offering; six-inch at $24 to $24.50; eight-inch $26 to $27; ten-

inch $29 to $30. Spruce furring—1 x 2, D.1.S. and B at $21.50 to $22. Hemlock, for desirable sizes, all even lengths at $22 or better, according to schedule. Spruce boards, four inch at $22; five inch $20 to $21; six inch and up $23 or better; all 10 to 16 ft. White pine box, six inches and up wide, 10 ft. and up long, $23 or better; narrow and shorts $21. Spruce laths; the market has not advanced since November 1st, and while we have heard of sales at slightly under $4, the market is at this figure today.

London Market Report

Churchill & Sim, London, Eng., in their monthly wood circular, under date of November 3rd, report as follows: Deliveries from stock during the month of October did not greatly differ in quantity when compared with those of October last year, but there is a decrease of some 6,000 standards in the overside total. The aggregate stock of softwoods is some 3,000 standards less than that of October, 1915. The market has shown consistent improvement during the month, and this applies to all sizes of wood used in the building and casemaking trades. Swedish and Norwegian shippers sent increased quantities, but the Russian supply was smaller, while the importation from Canada showed a very great falling off as regards London. A very large business has been arranged from the northern ports, especially from Sweden, for late autumn and early winter shipment, and prices have been enhanced by the dearness of tonnage and the dangers to which neutral shipping has been lately exposed.

The importation to date has about kept pace with that of last season, but fewer floorings have come to hand, and the stock of them in London is smaller than usual. A large business has been put through in Swedish productions during the month, especially to London, where prices have again been higher. Values for all sizes, especially scantlings, were upon the up grade, the demand showing itself capable of taking up whatever shippers were able to supply upon a delivered basis of payment. Stock-notes towards the end of the month were getting depleted of the sizes most currently in demand, and for the present there seems to be no check to a continuation of present conditions.

From the St. Lawrence has been imported: Pine deals 276,000 pieces, against 415,000 pieces in 1915; spruce deals 1,089,000 pieces, against 1,785,000 pieces in 1915; birch planks 132,000 pieces, against 284,000 pieces in 1915. And from New Brunswick, etc.: Pine deals, 32,000 pieces, against 65,000 pieces in 1915; spruce deals 572,000 pieces, against 1,790,000 pieces in 1915; birch planks 44,000 pieces, against 314,000 pieces in 1915.

There has been a notable reduction in the supply of both pine and spruce from Canada during the year, and values are consequently tending gradually upwards. The quantities available from the lower ports also show a great falling off, but spruce prices were slow to recover after the fall in July, and only recently have been showing signs of improvement now that it is realized that there is likely to be no surplus quantity in the country for the requirements of the winter.

Liverpool Spruce Market More Active

Smith & Tyrer, Ltd., Liverpool, Eng., in their monthly trade circular, under date of November 1st, report as follows: There is more activity in most directions, and the general situation is more satisfactory and promising. The shortage of labor, owing to the war, is bound to have its influence on the situation. Hardwoods are without change. Spruce deals—Unsold cargoes are now very limited in number, and there is a more active competition for those available. The consumption has been disappointing. Prices are firmer, and are likely to advance during the winter months. Hemlock has been in better demand, but only at low prices. Birch has been difficult, owing to the import restrictions, but an improved demand was experienced. Pine is unchanged. Pacific Coast woods—There is an active demand for clear spruce, and considerable business is reported, but other descriptions have been on the quiet side.

Liverpool Market Report

Alfred Dobell & Co., Liverpool, Eng., in their monthly timber market report, under date of November 1st, say: Spruce deals—There has been no set-back in the improvement, which is well maintained and likely to progress, notwithstanding that stocks have the appearance of being ample.

Douglas fir has arrived in very limited quantities. There has been very little demand for clear planks or squares, but merchantable logs 50 feet long and up are wanted, as these lengths are practically exhausted. Prices are firm, and the difficulty in securing freight room continues.

Barbados Market Report

S. P. Musson, Son & Company, Barbados, B.W.I., report under recent date as follows: Lumberstuffs.—There have been no arrivals of either white pine or spruce during the fortnight. There is some enquiry for the former for future shipment, but sufficient sales of the latter have been made to supply the market for some time. Shingles.—Gaspe are wanted, and could sell to advantage. Cedar laying.—Large sales have been made for prompt shipment, and we do not think there will be any opening for further quantities for the present. Shooks.—We note the arrival of a small parcel for dealer's account. Wood hoods.—No receipts.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending October 31st, 1916, is furnished by H. W. Lightburne & Company, Liverpool, and their St. John, N.B., representatives, John E. Moore & Company, Limited.

Type A Edgers—Canadian Allis-Chalmers, Limited

Canadian Allis-Chalmers, Limited, have issued a new bulletin, No. 1723, describing their Type A. Edgers. These edgers are the present form of the original Allis heavy timber edgers, having a one-piece solid cast frame containing all the bearings for the arbor and feed rolls. The designation "Type A" has been adopted in order to distinguish them from their other designs.

Before the introduction of these machines all edgers were too light, their frames not having sufficient stiffness to hold the high speed arbors in line and provide a rigid support for the saw shifters. In this design it was their aim: first—to provide a single bed plate or frame to support all arbor and feed roll bearings, stiff enough to keep these parts in line and running cool whether the frame was supported properly on the mill floor or not; and second—to provide shifting mechanism of the most simple, rigid, accurate and convenient type. How well this has been accomplished is indicated by the excellent record of these edgers for quantity and accuracy of lumber produced, and by their acknowledged popularity in the estimation of sawmill operators.

A Large Order for Link-Belt

The wide variety of uses for link-belt chains, as manufactured and sold by the Link-Belt Company, Chicago, Ill., whose products are well known to lumber manufacturers and woodworkers, is interestingly illustrated in a new bulletin (No. 282) recently issued by the company, describing and illustrating the use of link-belt silent chain for transmitting power in the dye-making industry. Probably the largest order for silent chain drives ever placed by any industrial company is that of 1,000 link-belt silent chain drives recently purchased for the plant of the Schoellkopf Aniline and Chemical Works, Inc., Buffalo, N.Y.

It will be interesting to lumber manufacturers in Canada who are closing down their plants on account of the approach of winter to learn that in the gulf coast region of East Texas and the western Port of Louisiana, lumber manufactures have recently been afflicted with the worst scourge of mosquitoes ever known and that several large mills have been compelled to close down on this account, men and animals being tortured to such an extent by the mosquitoes that they could not work.

Great Britain Demands More Canadian Wood Pulp

The Cooperage Industry—Details of Operation

Editor Canada Lumberman:—Can you give us any information as to the manufacture of wooden barrels and other packages, the kind of wood used for staves and heads, and other material required, the machines and tools required, labor necessary, and the prices obtained for the finished product? If you can give us any information on these points, or put us in touch with anyone who can, we will appreciate it very much.—Colonial Lumber Company, Antigonish, N.S.

A bulletin on the "Wood-using Industries of the Maritime Provinces," published by the Forestry Branch of the Department of the Interior, shortly before the war, contains the following information: The manufacture of barrel stock is the fourth most important industry in the Maritime Provinces. Reports received from cooperages in 1912 gave the following figures for the Maritime Provinces: Slack staves, 39,939,000; slack heading, 2,746,662 sets; slack hoops, 6,227,900; tight staves, sawn, 1,389,083; tight staves, bucked and split, 12,000; tight heading, sawn, 177,113 sets.

Eleven woods are reported as being used in this industry, and all these but willow were used in making slack staves, although spruce, balsam, fir, birch, pine, and poplar in the order named were used in greatest quantity. Every one of the eleven woods was used for slack heading, with spruce, balsam fir, pine, ash, poplar, and elm leading in the order named. Almost 90 per cent. of the hoops are made of spruce and birch in about equal quantities. Elm, poplar, maple, ash, and beech are also used, and small quantities of alder were reported. Many of these woods are used for "half round" hoops, and the consumption of wood for this purpose is difficult to estimate in board feet. Spruce, birch, balsam fir, white pine, oak, and beech are used for sawn tight staves; balsam fir, spruce, and oak for "bucked and split" tight staves; and spruce, white pine, balsam fir, birch, and oak for sawn tight heading.

Wood for staves should be as tough and stiff as possible, although for slack cooperage great strength is not required so much as in the case of tight cooperage, where the slightest failure of a stave would mean the loss of the contents of the barrel. Heading woods do not require toughness, but only stiffness and the quality of holding their shape. Wood for hoops must be tough. Apart from these qualities, cooperage woods are chosen chiefly on account of cheapness and abundance, although clear stock is imperative for tight cooperage and very desirable for slack staves. Slack heading is often made of knotty material.

The material for this industry is all purchased in the form of logs and sawn into cooperage stock. Firms who purchase manufactured stock and merely assemble barrels are not included. The average price paid for raw material was $18.71, which is only 69c above the general average for all industries. The wood was all purchased in the Maritime Provinces.

The cooperages purchased more elm than all the other industries combined. They paid the highest prices reported for balsam fir, birch, poplar, beech, and hemlock.

Further information regarding this subject is being obtained, and will be published later. Readers of the Canada Lumberman who can send us information regarding machinery and tools required, labor necessary, etc., are requested to communicate with us, so that we may furnish as complete information as possible to the enquirers.

L. B. Beale Back in Toronto

L. B. Beale, British Columbia Lumber Commissioner at Toronto, has returned from a visit of several months to the Pacific Coast. While in British Columbia Mr. Beale visited practically all the large lumber manufacturing plants of that province, and he reports that business conditions are showing remarkable improvement. In fact, all the manufacturers are encouraged in regard to the outlook, and are predicting a prosperous year during 1917.

British Columbia's 1916 Fire Season

The fire season of 1916 in British Columbia has been a rather exceptional one. Until the last week of July the weather was favorable and there were no fires in the Vancouver and Island forest districts. About the end of July a long drought set in which was not broken until October 28th. During this period the fire hazard was greatly intensified. The fire fighting expense in the Vancouver and Island forest district was about $7,500, which is about one-half the amount spent in 1915. The area burned over in these two districts covered 10,000 acres, compared with 140,729 acres in 1915. Included in the area burned this season there were 300 acres of merchantable timber and 8,648 acres of logging slash. The damage done last year amounted to $85,000. This year's damage was only $10,505. The total damage amounted to 1,135,000 feet of merchantable timber during 1916, of which about one-half will be logged without much loss. During 1915 the damage amounted to 73,000,000 feet, of which 43,000,000 feet was reckoned as salvable.

Will Take Out All They Can—Labor Scarce

Editor Canada Lumberman: Buffalo, N.Y.

We are expecting to put out a fair stock of logs in connection with our New Ontario operations during this winter. Labor, however, with us, is scarce, and may be the means of curtailing the amount we had planned to put out. However, it is our intention to put out what logs we are able to. Stock we put out last year was comparatively light. The outlook for the coming year is very favorable—much better than it was a year ago.—W. K. Jackson, Limited.

Operations Handicapped by Labor Scarcity

Editor Canada Lumberman: Burks Falls, Ont.

Conditions affecting the log crop in this locality are such as to render it impossible to give anything more than a guess as to the amount that will be taken out. As for ourselves it is not the amount we will take out that has to be considered, but the amount we can get taken out, in view of the high cost, and particularly in view of the scarcity of labor.

We hope to get about 4,000,000 feet of hardwood and softwood, sufficient for the season's cut, but we are prepared to be disappointed and have to be satisfied with very much less, for the reasons given above.—The Knight Bros. Company, Limited.

Prices Should Advance by Thirty-three and One-third Per Cent.

Editor Canada Lumberman: Huntsville, Ont.

We expect to take out during the coming winter about four million feet of hemlock, 750,000 feet of spruce, 750,000 feet of hardwood, principally birch, basswood and elm, and 250,000 feet of white pine. This will be more than double the stock we took out during 1915-16, but the cost of producing this stock we feel satisfied will be fifty per cent. more than in 1915-16. Wages and provisions are fully fifty per cent. higher than at the same period last year. The men are not better, and in fact, it is more difficult to get the full gang of good bush men than it has ever been in the past.

From present appearances, there will have to be about thirty-three and one-third per cent. advance in the price of lumber if the manufacturer is going to come out with any margin of profit.—The Muskoka Wood Manufacturing Company, Limited.

Lumber Retailers Ought to Boost Their Stock

The state of mind which leads a lumber dealer to depreciate to the public the value of the product from which he makes his living is beyond comprehension. Attention has recently been called to the remarks of a city dealer, in which he is quoted as having said that "Lumber now is often of a lower grade, some of the second growth being used. Practically the same prices exist."

We have always maintained the fact that lumber is as good today as it ever was and in some cases even better if the right lumber is used in the right place. The different lumber associations are spending huge sums of money to promote the use of lumber, and they are entitled to the support of the lumber yards. Every retail lumber dealer should put his shoulder to the wheel to help this good work; they should help to build up and not try to tear down, as above indicated. We all know that lumber is abused enough by others, without adding abuse from our own dealers. They (the dealers) should realize that if the general use of lumber can be increased 25 per cent. in the community it will mean more business for them at fair prices. The trouble with the local conditions today is that there is not enough business to go around, and if business can be increased and give everybody a fair share it will surely have a tendency to improve the lumber yard trade. For this reason alone every retail lumber yard dealer should be a booster of lumber, and not be a knocker by telling the public that lumber is poorer than it was years ago.—E. A. Sterling.

Mr. Hugh A. Rose, Toronto representative for Mason, Gordon & Company, Montreal, left for British Columbia about November 15th on a business trip in the interests of his firm. Mr. Rose will return about the middle of December.

HAMILTON, ONT.

Paid for themselves the first year, is the report the Mills-Carleton Lumber Company makes on its *three* Packards

"For delivering lumber, the motor truck is the ***only*** means," says E.M. Carleton, Vice-President of this important concern, which has extensive yards at Cleveland, Ohio.

"We are positive, from our cost accounts, that our Packards paid for themselves and made a profit besides, in the first year each was in service."

On a recent test, one of the company's 4-ton Packards backed up Mr. Carleton's words by earning $28 in 8 hours and 18 minutes—more than four times as much as a competing team of horses.

The Packard made four trips that day, totaling 72 miles, and delivered 15,132 board feet of lumber.

The Mills-Carleton Company bought its first Packard truck in 1910—standardized on Packards in 1914—and bought another Packard last March.

Lumbermen who purchase Packard trucks ***usually*** re-order. Seven sizes of silent worm-drive Packards—1 ton to 6½ tons—enable them to standardize and get the exact combination of speed, power and capacity the business needs.

The counsel of our traffic engineers will help you to determine the right size, the proper body, the correct equipment throughout. Write or telephone us today for list of lumbermen and dealers operating Packard trucks.

International Co-operation Necessary

Pacific Coast Manufacturers of Canada and United States Urged to Work Together for Promotion of Export Demand for Lumber

At the "Forest Industry Conference" held recently at Portland, Oregon, an important address was delivered by Mr. H. R. MacMillan, former special lumber trade commissioner for Canada, who is now assistant manager of the Victoria Lumber and Manufacturing Company, Limited, Chemainus, B.C. Mr. MacMillan's subject was "International Co-operation," and he spoke as follows:—

"I have been listening very carefully to the chairman's constant expression of optimism that a great foreign market will develop in some hitherto undiscovered part of the world and take care of all of these problems. Now, it is just that kind of optimism I want to condemn. It is not going to get anybody anywhere (laughter), and I am surprised at the chairman that he should so constantly reiterate one of the basic evils of the business.

"This association is very properly the place to discuss co-operation. They introduced co-operation and, consequently, success, into the fire protection business; and now they are coming around to co-operation in something which is much more important than fire protection. I suppose at the very most our losses from forest fires have not been greater than $2,000,000 or $3,000,000 a year. Just this $2 a thousand, which we can get any minute we really want it, and go after it, on a Douglas fir cut alone, would be $20,000,000 a year. (Applause).

"So co-operation in marketing is just ten times more important than co-operation in stopping forest fires. In fact, so long as the people in this country are content to sell these 400-year old trees on a $9 basis on an export list, I don't see why we should not continue to have forest fires; we would be money ahead. (Laughter and applause).

"I am down here to speak of the necessity for international co-operation. International co-operation is necessary here on three different points; and from the Canadian standpoint, so far as I know it, the Canadians are extremely anxious to expand, and work in international co-operation. The first thing is educating the public to a knowledge of the conditions under which the lumber industry labors.

Progress Demands Co-operation

"Supposing you carried out this work, as you are certainly doing, and in a short time have adjusted your stumpage situation; what good is that going to do you in the foreign market if the Canadians have not kept pace with you? We all know that we have not got nearly so much timber as you have. We probably have about a third that is available for export, a third as much as you have in the Douglas fir region. That little third is just enough to upset all your combinations and calculations for as long as anybody in this room is going to live. Therefore, so far as the coast is concerned, the Canadians and the people of the United States must operate together. You can do nothing unless the Canadian progress is made equal to your progress. And at the present time, in a public understanding of the lumber situation and in the preparation of adequate and expert machinery to take care of the lumber situation, the Canadians are not on a par with you here in the United States. It is a very humiliating confession to make, but we must make the progress that you are making, and the only thing, or one great feature of encouragement, is that we speak a common language and can learn from what you have done.

"The second part of the international co-operation is not so necessary. It is simply a case where we should add our little to what you are going to do; and that is that these foreign countries must be taught to use our lumber more wisely and to use more of it.

"I was very glad to hear the gentleman who just spoke refer to the conditions in South America. I was not in South America, but every place else I was I found the situation ludicrous, if it had not been so pathetic. I found no person selling lumber in any place I visited, which was the whole of the British Empire and some other countries. There is no person selling our timber anywhere. I argued for the best part of two days with the Society of Civil Engineers in South Africa to induce them to believe that Douglas fir was a good timber to use for temporary bridge construction. I saw them pull down old buildings in Cape Town and take out second-hand pitch pine timbers that were cut in every conceivable direction with mortises and tenons and saw them up and use them for railway carriage building at the large cost of 7s 6d per board, when Douglas fir, a fresh cargo from this coast, was offered to them in absolutely sound timbers at a third the price. They don't believe in Douglas fir. I mentioned Douglas fir, as it happened to be the only wood in which Canadians are interested. The same condition applies to every west coast wood.

"It is inconceivable to believe that hundreds of millions of dollars can be invested here in holding timber lands and bringing the manufacture of lumber to the highest point of manufactured production and not a particle of care taken of the cargo after it is loaded on the ship. (Applause). But that is the condition that exists.

American Lumber in China

"The chairman mentioned yesterday morning, I think, what a wonderful opportunity China presented. China will be a market for railway sleepers, but if you went over there at the present moment and attempted to give them creosoted Douglas fir railway sleepers you could not do it. The people who have been creosoting Douglas fir for export here have evidently had their whole ambition staked on selling one cargo; they probably did not care about selling another. At least, that is the only thing an observer in that country can judge. Cargoes have been sold in India that have fallen to pieces in the ship's slings, and others have only lasted from two months to two years in the track; and the result is every potential purchaser of Douglas fir sleepers in either China or India is now an enemy of the Douglas fir business.

"We found people in almost every town selling cement, iron and all manner of substitutes; and for every little thing that develops which is wrong with any commodity on the market, there is an expert there, in a minute, to adjust the situation. A Douglas fir cargo arrives, some little thing goes wrong about it, and there is nobody there to look after it, and they immediately look for something else.

"I can give you an instance which will show you how the foreign purchaser learns about woods. The city engineer of the city of Melbourne, a city of about 700,000 people, depending almost entirely upon imported soft wood, is in a position to condemn any wood going into any public building. Naturally his condemnation of a wood for public buildings leads to similar condemnation by private owners. They are very largely guided by government authority. If the wood is not fit to put into a public building, the retailer hesitates to carry it in stock and it is condemned throughout the trade.

Introduction of Redwood into Melbourne

"The city engineer of Melbourne was looking for a fireproof wood to use in halls, stairways and in all public buildings. He was building a lattice work fence around his garden at home and he had a lot of redwood lath. He built the fence himself and had a lot of short pieces and shavings left, and the boiling of their washing was done over an open kettle outside. He left those shavings and short pieces and thought they would be very fine to light the fire with for the washing. The washwoman came and struggled all day without lighting the fire, and when he came home at night he ran into a domestic tempest. Then he discovered "here was fireproof wood;" and since that day every public building in Melbourne has had to be lined with redwood and all the halls. That is where the man got his information. (Applause).

"Now that is simply typical of what is going on amongst millions of potential users of west coast woods. That same man, it happened, built a house for himself. Somehow or other he discovered dry rot through defective ventilation in the basement joists of his building. These joists were Douglas fir. Something went through the floor, I don't know what it was, a stove or something like that, and since that time in no public building in Melbourne is Douglas fir allowed to be used for basement joists. That is the way they get their information, by blundering blindly from one fact to another, and very often, when they arrive at it, if it is not a fact, it is a prejudice.

Douglas Fir in South Africa

"I remember one incident that occurred in the gold mining district on the Reef in South Africa. The price of the Swedish 3 x 9 deals that they had been using for scaffolding in the mines went so high that one of the mine purchasing agents, a keen chap, who controlled the purchase of about 30,000,000 feet of timber annually and only for one group of mines—thus controlling to a certain extent the purchases made by other mines, because if he brought in a large quantity of timber the others used the same stuff—endeavored to introduce Douglas fir 3 x 9 in the mines.

"The laborers refused to stand on 3 x 9 Douglas fir for fear it would not hold them and insisted on two thicknesses being put wherever the Douglas fir was used, with the result that it was put out of business. This man had no time to fight labor unions. If he had been deeply interested in using Douglas fir, or some one else had been there who would have produced the facts in favor of the Douglas fir, he might have insisted on using it. At the present time there is enough corrugated iron imported to replace 3,000,000,000 feet of timber, and

GOOD FLOUR FOR YOUR CAMP

The best economy in the world is to buy that commodity which, being good, is the cheapest value on the market. This simply means, when choosing flour, don't be altogether influenced by price, but get a wholesome, nourishing, uniform product that will bake up into appetizing food. That is why we recommend for your camp

Cream of the West Flour

The Hard Wheat Flour that is guaranteed for Bread

For years this flour has been held up as an excellent example of the "pure food" idea. and we are jealous in guarding that reputation. Your men will readily respond to your efforts in giving them good food with more work and cheerful dispositions, which means a big money saving to you.

Our horse feed is distinctly good. Bullrush Crushed Oats (best grade Western oats) and Geneva Feed (crushed oats and cracked corn) are both worthy of attention for your stable.

Sherbrooke Montreal Cobalt So. Porcupine St. Catharines Toronto Vancouver Nelson

the proportion is constantly increasing, so far as I can find out. The per capita use of soft wood timber in Australia is only 24 feet per year —almost an unlimited opportunity for the development of the market.

"I could discuss this for hours, it seems to me, because it is a boiling, burning subject—the utter insanity of the manner in which we have sat here at home and howled about hard times and failed to develop the foreign markets.

Getting More Money for the Product

"The second thing is the question of getting more money for the timber we do export. With every exporter I met, the very first inquiry he made was as to the mental condition of the people who made and produced and sold this lumber. They cannot understand it. (Laughter). In fact, they don't believe yet that it is true. The first thing is entirely price. We sell lumber here at $8 to $10 base. The freight in normal times is $10 to Australia. The duty is from $2 to $7 a thousand. The landed cost c.i.f. and d. is in the neighborhood of $30. In normal times they retail that lumber throughout Australia for $56 a thousand. An extra $2 or $4 to us would make absolutely no difference to the consumers in Australia; they would never hear about it. The only alterations they ever make in their price lists in Australia are alterations of $6 a thousand, 60 cents a hundred; so they probably would not bother with little increases of $2 in the f.a.s. price. (Laughter).

"When the freight rates jump from $10 a thousand to $20 a thousand it does not affect in the least, so far as I can find out, the consumption of lumber in Australia. They used the same proportion of lumber in building when the price was a little lower. The difference between $55 a thousand and $60 a thousand in a country using 20 board feet per capita per year does not amount to anything. They would never hear about it.

"The next thing is, if we spent a small proportion of the increased price that we get, say 25 cents a thousand, which would be $150,000 a year for the Douglas fir region alone, we could probably pretty nearly double our sales.

"There is another mistake we make in the export market, and that is that the spread in 'G' list, on long timbers, large timbers, selects and clears, is a gift to the purchaser. We are bonusing every purchaser who buys a long timber. I have been greatly interested always in exhibits that this association has had here. I was informed a short time ago that a gentleman here on the Columbia River sold a cargo specification for $8.50 a thousand. I think he would be the most interesting exhibit that this association could have had to present to the lumbermen assembled here. (Laughter and applause).

"I have in my pocket, or in my hand, rather, a short statement, which is worth reading, taken from a Sydney retail price list of January, 1915. I am talking about Sydney or Melbourne all the time, because there is no use of talking about one hundred places when the conditions in one are simply multiplied in all the others. This refers to what they do to our 'G' list when they get it down amongst the consumers. On a timber 41 to 50 feet long we charge extra $3 a thousand; the Sydney retailer, when it costs him $30, landed, sells on a base of $56.80; and then where we add $3 he adds an additional $13.20. So on a timber 12 x 12—41 feet and 50 feet long, he gets a profit of nearly $30. For 51 to 60, where we add $6, he adds $15.60; 61 to 70, where we add $9, he adds $20.40; 71 to 80, where we add $13, he adds $25.20.

The Question of Prices

"Now I would like to ask if any person in this room believes that one of these 300 or 400-year-old trees, which we own and protect from fire and stand around here and discuss for a day or two in every year, should be administered wholly for the benefit of the Sydney retailer? And that is just what has happened.

"The same condition exists in the larger dimensions, 31 to 40 feet long. This is an additional charge. For 14 x 14, we charge $1 extra; they sell it at a profit of a little over $16 base and add $2.40 for having it big. They don't grow it; we grew it; but they get the money for growing it. For 16 x 16, we charge $2, and they charge $5. For 18 x 18, we charge $3, and they charge $15. They appreciate that that was an expensive tree to grow, therefore they tack on $15 profit. (Laughter). For 20 x 20 we charge $4, and they charge $20. And they get it, too. There is no cutting on these price lists. (Laughter).

"For clears we charge, on a 1 x 6, $7.50 a thousand; the wise Sydney men get together and they say, 'That stuff is scarce upon the west coast of North America; we will charge them $12 a thousand for it.' They charge them $12 and they get it. And that goes on all the time.

Australian Buyers Have Us on the Run

"There is another thing I was pretty nearly going to forget, and that is that these Australian buyers have us on the run. We may flatter ourselves that we have a grading bureau here and we sell them what we want to sell.

"After we have cut the price down to a basis where we can't look it in the face, we go to work and compete on grade competition, and the result is that cargoes go in there one after another which grade away above merchantable, even when only merchantable is paid for. That is the fault of the shipper.

"I don't mean to intimate for a moment that it is the fault of the grading organization. The shippers are putting in altogether too good timber. The result is, walking down the main street of Sydney about three months and a half ago I saw a temporary fence put up around a bank building—just one of those fences to keep passers-by from stumbling over the brick and mortar. I counted the first 122 boards in that fence and thirty-six of them were 1 x 6-6 foot edge grain perfect flooring boards. If they paid for this lumber what they should pay, according to the quality which is inherent in it (it belongs in this country and not Australia), they would not use it for temporary board fences; they would not think of it.

"The trouble is they are being given by us a champagne taste which we have not got the financial capacity to keep up. We cannot continue to feed them this stuff on the present price. They are getting the idea these Douglas fir trees grow to be four feet square, absolutely square, clear to the heart, and all you have to do is slice them off and cut clear boards. They have to buy our timber (so far as I can see at the present moment, they have no other possible source of supply) and what we should do is to get together and insist when they buy they buy the whole log; that every cargo carries a certain proportion of common. They can use common in building a city in Australia as easily as we can use common in building a city in North America. It only requires that we should have control of the trade and assume control and deal fairly with them; but make them take our lowers as well as our upper grades; and then the cargo business will be of some assistance to the interior lumberman. But so long as we sell only the high grades foreign and keep the low grades home to burn or to ship into the interior, the cargo business can only benefit the cargo mills, and it cannot benefit them at the present level of prices.

"The only suggestion I have to make is that, having carried out this co-operation in fire protection, in which you have co-operated with us Canadians out of the good of your hearts, that you should now enter with us into a co-operation for the good of your pockets in putting the lumber before the foreign purchaser in such a shape as he will pay for it." (Applause).

The Logging Manager's Qualifications

By John Rains*

He must have an existence before the operating company is formed. Many a lumbering proposition would never have been organized for failure had the logging manager first been consulted. Here sometimes "fools rush in where angels fear to tread." Some years ago an observing woman remarked to the writer, after he had examined a tract of timber, that a good many men had looked it over, and that some day one with more money than brains would appear and that they would sell it. The sale soon took place, and with disastrous results. Here is where our hero must shine. He must be a great timber estimator. He is a good judge of the quality of the stand estimated as well as its quantity. He has gained his knowledge and judgment by continuous estimates and study of various forest stands and further by following the logs through the mill and comparing actual outcome with his own prior estimates. He is conservative in all of his estimates. He accepts and uses the scientific methods of the Forest Service. While a practical man, he is yet broad enough to appreciate all that exact science has to teach him. Because he is capable as an estimator and sure of himself as to the skdding feasibility of the same, his judgment must determine the commercial possibilities of any given stand of timber.

He must be able to put a proper value on stumpage in relation to its ultimate market. Other things being equal, the higher the transportation charges the lower the stumpage values. His knowledge of ultimate values and proportion of grades will here serve him a great purpose.

Then our manager makes himself perfectly familiar with skidding conditions. Here is where he must be onto his job or costs will consume him. He makes a careful survey of the topography of the country and determines what system of logging will best suit his conditions. He may have to use every modern known system to operate his whole tract or tracts economically. He has an open mind, and will not deny the old methods simply because they are old. There is a possibility of overreaching the mark with cumbersome machinery, but generally he is safe in getting away as far as possible from brute force. He has the modern outlook, and recognizes that this is an age of steam in logging. And the nearer he can get the mill to the railroad, the railroad to the timber, and the steam skidder to the individual tree, the cheaper logging he can do.

He insists on being his own engineer, and determines grades and curves within the limit of safety. His judgment only in individual situations determines where railroading shall cease and skidding begin. He realizes that the log nearest the steel is the cheapest

* Address delivered before Appalachian Logging Congress.

Look Into the Chain Question—

And you will find that JEFFREY CHAINS have a reputation for RELIABILITY and ECONOMY in the handling of logs, lumber, refuse, wood pulp, chips, etc.

They are made right in every detail,—of high grade materials,—careful workmanship and of designs proved in long service in your work. Every chain proof-tested before it is shipped to you.

An intimate knowledge of saw mill and pulp mill conditions and requirements, gained in nearly 40 years of field and manufacturing experience makes the suggestions of **JEFFREY ENGINEERS** exceedingly worth while to you.

Factory and Warehouse

147 to 151 Albert Street, Ottawa, Can.

skidded, but the amount of available stumpage must determine to what distance he can push his steel and thus cheapen the actual skidding. The nice balance between railroading and skidding must be determined by our manager, and here is just where the most expensive mistakes are sometimes made. Local conditions must determine what shall be done. Each stream, each mountain, and finally each logging proposition as a whole may require different treatment, and the real office of the manager is to determine how each situation is to be handled for economical production. Because A has been successful with one method of logging is no reason why B should use the same method.

Our manager must determine the relative merits of standard and narrow-gauge railroading. Personally we have never been able to persuade ourselves that the narrow gauge was economical for the handling of not only logs, but bark and wood as well. It has been our experience that if we are to handle large stocks of logs with consequent heavy equipment, track and ties must be practically as durable for the narrow as the standard gauge, and there is, consequently, little saving in the cost of construction and no saving in the cost of operation, and an actual loss in the handling of bark and wood. The size of the operation and the possibility of future railroad development will have some bearing in determining gauge.

Looking backward, our manager finds that much progress has been made in recent years in logging methods. However, he is not satisfied, but it still working to improve upon the past. The method that has the most pressing appeal to him is to deliver the timber to the mill in the whole tree, or practically so, where it can be cut for both grades and lengths under the eye of one man, who shall be specially qualified for that work.

Conscious of the value of stumpage, our ideal manager is constantly working on the problem of eliminating waste and conserving all of the economically valuable wood. This means that he insists on securing all the valuable timber and bringing to the mill such, and only such, parts of the whole tree as are commercially profitable. For the residue he is seeking avenues of disposition in other directions, and here he calls to his aid the chemist and the government. There are, no doubt, commercial possibilities in all wood waste, and the government could render no better service than to aid the lumberman in finding uses and a market for all such waste. These latent values some day the magic wand of the chemist, under government aid, will make real.

He believes that the lumberman has an obligation to future generations, and so uses all means to conserve the newly-growing timber. The recent statement of the chief forester of the United States that by reducing waste it is possible to harvest a continuous crop of hardwoods from the present stand, and at the present rate of production quickens his pulse and stirs him to renewed efforts to lessen this waste and help to conserve these valuable hardwoods. To this end he combats the forest's greatest enemy—fire. Especially during dry seasons he insists on carefully hooded and screened locomotives; all trains fully equipped with hose and buckets; the outlook tower being carefully manned, and constant watchfulness to prevent the smallest beginning of fire.

Our ideal manager is a crank on cost accounting, and is able to show from month to mouth not only all the varied items that go to make up his totals, but adds thereto ample depreciation to consume his plant during its operation. Only thus can he keep from deceiving himself as to visible profits up to the close of his operation. However others may figure that low-grade lumber costs less to produce than high-grade, for himself he can prove by detailed accounting that his small and low-grade logs cost more to saw, trim, grab, skid, roll, load, and haul to the pond than the larger, high-grade logs.

He is a strategist, and knows how to handle men. He looks after the physical comforts of his men. His model camp is well lighted and ventilated; has ample storage and kitchen facilities; the dining camp is clean and roomy; sleeping quarters are kept clean and orderly; he provides a well-equipped reading and writing-room; pure water is always supplied, and the sanitary conditions are well looked after, for any man below par physically or mentally is the worst asset of any camp.

He has an open mind and, while keeping his own counsel and doing his own will, is eager for suggestions from both superiors and inferiors. He is not like the laws of the Medes and Persians, that change not, but is ready to discard the mistakes of yesterday for the light and wisdom of to-day. Especially does he solicit suggestions from the men immediately about him, for they are rich in practical ideas.

Of necessity he must be the chief counsel of the business. New problems of the greatest concern present themselves daily, and he has constant need of all his faculties. Hence he must keep his mind clear and body fit at all times. In short, he is a personality unhampered by the past, believing all things of the future, living, thinking, planning, and accomplishing day by day the highest results in the game of lumbering.

Quebec Forest Revenue

According to the report of the Quebec Lands and Forests Department just issued, the total revenue for the year was $1,807,259. Receipts from sales and areas amount to the sum of $75,703.59, while the sale of Crown lands, hydraulic powers, etc., produced the sum of $28,353.81, with expenses for the service amounting to $2,-219.50. Revenue from woods and forests amounted to $1,683,682.23, as follows: ground rent, $352,380.26; stumpage dues, $1,221,683.82; penalties and fines, $24,255.17; accrued interest $33,826.85; transfers, $10,720; premiums, $10,816.13. An area of 339,725 acres was subdivided during the year, and 103,658 acres reverted to the Crown. There is at the disposal of the Government at present 7,465,637 acres. The Hon. Jules Allard reports that owing to the system of fire protection the forests in the province did not suffer to any great extent, and he has high hopes for the future.

Douglas Fir Export Company

Manufacturers of Douglas fir in the Pacific Coast states have organized the Douglas Fir Exploitation and Export Company, the object being to promote foreign trade. Attention will be given immediately to standardization of grades, to the special preparation of export lumber, to propaganda in foreign markets, and to other details which will assist in the campaign. A. A. Baxter, manager of the Charles Nelson Company, San Francisco, is acting as general manager, and has opened offices in San Francisco. Charles E. Hill, manager of the Tacoma Mill Company, Tacoma, Wash., is looking after the affairs of the company in the North for the time being. Mills that have subscribed to stock in the company have a combined daily capacity of 6,790,000 feet per ten hours.

Low Prices and Wasteful Methods in the U. S.

Census statistics in the United States show that lumber prices, based on the figure received by the manufacturer, were 10 per cent. less in 1915 than in 1906, an actual loss in the ten years which have marked the greatest advance in commodity prices in the history of the nation in almost every other line. The problem of the lumber industry today, however, is not that of getting more for the lumber, but of utilization of the waste. A larger market, assured by scientific merchandising, will solve this problem, by making it possible to avoid the waste, which is chiefly due to the necessity, under inactive market conditions, of merely cutting the cream of the forest, to raise money quickly.—R. H. Downman.

Exchanging Private Land for Timber Lands in Quebec

The Quebec Legislative Assembly have read, for a third time, a bill affecting the exchange of private lands for timber lands, with a view to facilitating colonization. Part of the bill reads: "And that such lands, as soon as they are acquired by the Crown, shall be classed as public lands; that the Lieutenant-Governor-in-Council may sell public lands, for industrial purposes, upon the conditions and for the prices he may determine, but that in a territory under license to cut timber lands may thus be sold only for the operation of hydraulic power or in connection therewith; that the lands so sold shall be no longer subject to the license to cut timber, from and after the date of the letters patent or other title given by the Crown."

Reports from important lumber consuming points in the prairie provinces all agree that the demand for lumber has reached a stage far in advance to what it was earlier in the year. Retailers state that they are scarcely able to supply the demand and that there is a splendid outlook for a continuation of the present extraordinary volume of business. One retailer reports that during October his business was as great as during six months of last year.

The lumber cut in the Cobequids and along the Parrsboro shore of Nova Scotia will be exceptionally large this winter, if sufficient labor can be obtained. Prices in the European markets are high, and lumbermen are making special efforts to bring out an increased stock of logs. Many of the crews have started operating in the woods.

Interesting Link-Belt Installations

The Link-Belt Company, Chicago, Ill., have issued two new booklets describing their machinery for handling coal and ashes which have been installed for the Victor Talking Machine Company at Camden. N.J., and the W. H. Grundy Company, Bristol, Pa. The booklets are attractively illustrated, and give a splendid idea of the manner in which the link-belt products perform their work. These goods are well known to Canadian manufacturers through the Canadian Link-Belt Company, Ltd., 265 Wellington Street West, Toronto.

The Dominion Wire Rope Company, Limited, whose head office is in Montreal, P.Q., have opened an office in Toronto, at Room 108 Mail Building.

EDGINGS

Ontario

The sawmill belonging to E. Witters, Mildmay, Ont., was recently destroyed by fire, incurring a loss of $3,000. The owner is considering rebuilding in the near future.

The Canadian Woodenware Company, St. Thomas, Ont., report that they will not complete the erection of their new plant before next spring and will continue operating in their present plant until that time.

Mr. A. J. H. Eckhardt, 500 Huron Street, Toronto, represeenting a syndicate is negotiating for the purchase of certain timber limits in the province of Quebec. The intention is to erect saw and pulp mills. The work of constructing the plants will not be commenced before next spring.

As a result of the continued absence of Mr. P. J. Noel, lumber manufacturer, Fort Frances, Ont., the P. J. Noel Lumber Company have made an assignment for the benefit of their creditors. Mr. Noel disappeared mysteriously and no explanation of his absence has been obtained. He was last seen at International Falls on October 7th, and his many friends are extremely anxious regarding his whereabouts.

The town of Port Arthur, Ont., has ratified the agreement between that city and A. G. McIntyre, recently appointed news print manager of the American Newspaper Publishers' Association, who represents interests controlling several other pulp mills in Canada. The company will build a plant of 150 tons output of sulphite pulp per day, in three units of 50 tons each, to which will later be added a paper mill under the agreement upon which the pulp limits are secured from the Ontario Government; the 150 ton plant must be completed in three years at a cost of $1,000,000. Construction will be started immediately and the location will be at Bare Point in the north end of Port Arthur. The city gives 100 acres of land to the new industry with no exemption from taxation or other bonus.

Eastern Canada

The sash and door factory belonging to J. A. Nadeau, Drummondville, P. Q., was recently destroyed by fire, incurring a loss of $15,000. The owners will probably rebuild.

Fire recently destroyed the sulphur shed of the Dominion Pulp Company, located at the Canada dock, Chatham, N. B., the loss also including a considerable quantity of sulphur.

Fraser Limited, Carleton Street, Fredericton, N. B., are contemplating the erection of a pulp mill. They have under consideration the organization of a company with capital of $4,000,000. The site for the new mill has not yet been definitely settled.

G. H. Vernon and T. T. Davis, Truro, N. S., will operate on an extensive scale this winter. They already have five crews in the bush at Riversdale, Malagash, Upper Mount Thom, Kemptown and Debert. Messrs. Vernon and Davis will ship their product overseas.

The Canada Paper Company, Limited, Windsor Mills, P. Q., has commeenced work on the erection of paper mills to cost $30,000. The building will be two storeys, 128 x 57 feet, and will be of reinforced concrete and brick construction. The general contractors are A. F. Byers & Company, Limited, 340 University Street, Montreal.

The mill of the Pejepscot Lumber Company of Great Salmon River, N. B., which was destroyed by fire in the fall of 1915, has been rebuilt. The new mill cost about $45,000, and has a capacity of 50,000 feet of sawed lumber per day. The plant is also equipped with a new barking drum for barking pulpwood, which takes care of 75 cords per day. The plant is lighted with electric light.

The Brompton Pulp and Paper Company, Limited, have been incorporated under Dominion charter to take over the business undertaking and assets of the Brompton Pulp and Paper Company, which was incorporated in 1912 by special act of the Legislature of the province of Quebec. The company's present annual output consists of the following:—groundwood pulp 30,000 tons, newsprint paper 16,500 tons, kraft pulp 12,000 tons, kraft and fibre paper 9,000 tons, box board 10,500 tons, merchantable timber, 15,000,000 feet b.m., shingles 5,000,000 pieces, railroad ties 30,000 pieces, miscellaneous timber, 1,000,000 feet b.m.

Haley & Son, St. Stephen, N. B., have commenced to rebuild their plant and warehouse which were recently destroyed by fire. The warehouse has now been all framed up and boarded in. It will be 100 ft. by 60 ft. Work upon the factory is also progressing, and the concrete foundations are nearly finished. The factory will be 100 ft. by 75 ft., two storeys, with an ell about 60 ft. by 40 ft., also two storeys. The total equipment, including power plant, which was not destroyed by fire, will cost about $50,000. The firm will continue the same line of business as formerly, namely, sawing logs for box shooks.

making box shooks and all kinds of mill work. They expect to be in running shape by March, 1917.

Western Canada

J. P. Pringle's sawmill at Grande Prairie, near Salmon River, B. C., was recently destroyed by fire. The loss included 150,000 feet of lumber.

The Vedder River Shingle Mill, of West Vancouver, B.C., are commencing operations early this month and giving employment to about one hundred men.

The Dominion Cedar and Shingle Company's shingle mill near New Westminster, B. C., has been completed and the machinery is being installed. The plant will probably be in operation about the middle of December.

The Coast Central Mill Company, Limited, has been incorporated with head office at New Westminster, B. C., and capital stock of $200,000, to carry on business as loggers and as manufacturers of timber, lumber, shingles, etc.

The Burrard Saw Mills, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $25,000, to carry on business as loggers, sawmill and shingle mill proprietors, lumber and timber merchants, etc.

W. M. Gilfoy, Calgary, Alta., reports that there is a strong likelihood of another pulp mill being opened up in British Columbia in the near future. Mr. Gilfoy, who is the head of the Coast Timber and Trading Company, states that a syndicate of eastern capitalists is endeavoring to acquire large tracts of timber and that considerable progress has been made. He also states that if the undertaking is carried out it will mean the erection of the largest pulp mill in Canada.

J. S. Emerson, 744 Hastings Street West, Vancouver, B. C., reports that he has plans in progress for the erection of a sawmill, kilns for seasoning, and shingle and planing mills at Prince Rupert, B. C. The capacity of the sawmill will be 75,000 feet per day. The mill will give employment to about 300 men and will turn out everything from house building material to lumber and timber for the construction of ships. A site at the eastern end of Kaien Island is being considered.

The Canadian Robert Dollar Company will commence work almost immediately on the construction of a sawmill and docks at North Vancouver, B. C., at a cost of $200,000. The mill will be electrically operated and will have a capacity of 175,000 feet per day. The dock will be about 800 feet long. The company will also erect about twenty houses for its employees. Most of the equipment of the mill will be secured from the plant at Ruskin, B. C., formerly belonging to E. H. Heaps & Company, which the Canadian Robert Dollar Company have purchased. The chief party interested in the company is Mr. A. M. Dollar. The company expect to have the plant and docks completed within four months.

F. H. Hopkins & Company, whose head office is in Montreal, have opened an office in Toronto, at Room 108 Mail Building.

Imports of wood goods into Bristol, England, during the six months ending June 30, 1916, amounted to 33,870 tons. More than half of these goods were obtained in Canada, the total being 18,363 tons.

Chester Derring, of the Niagara Insurance Company, New York, and J. F. R. Webber, of the Springfield Insurance Company, Springfield, Mass., recently visited a number of British Columbia plants on which they are carrying fire risks, and, according to their report, trade conditions are most encouraging.

A record price was reported for shingle bolts in Vancouver towards the end of October, when they reached $7.25 for choice lots, according to a press report. The same report tells of a decided shortage of bolts, which is accounted for by the difficulty in getting labor and the scarcity of water in the creeks.

Mr. S. C. Yeomans, of Malay, recently visited Vancouver, and in an interview stated that the Federated Malay States are endeavoring to obtain supplies of wood pulp from British Columbia. The source of supply for the Malay States has been interfered with by the war, and British Columbia offers the greatest advantages in connection with securing future stocks.

The Brown Corporation have a first-class modern dressing plant in connection with their mills at La Tuque, Que., and they make a specialty of dressing, re-sawing, and ripping lumber in transit. They have such excellent facilities that shipments can be put through promptly, and the plant is modern in every way. La Tuque is located on both the Canadian Northern and Transcontinental railways.

E. C. Atkins & Co., Indianapolis, Ind., report that Mr. T. A. Carroll has been appointed manager of their advertising department, to succeed Mr. H. T. Benham, who has resigned. Mr. Carroll has been in charge of the company's trade service department and is therefore acquainted with the details of his new work. The former manager, Mr. Benham, resigned in order to enter a new field of business.

Take a Look at the Pile

of heavy timbers in our yard. Note how squarely they pile and match. That's because they are all straight grained and have been seasoned evenly. Just a sample of all the lumber here. The best selected wood in the first place and the best of care in putting it in condition. It pays to use such lumber.

What Officers Should Buy Before Going to England

Also What They Should Not Buy—Forty-Five Revolvers are Very Scarce in England.

A Canadian officer in England on the eve of departure for France has sent home for the benefit of officers in Canada, who have not yet gone overseas, the following information about certain equipment they should not carry with them from here, as it is of no use; some other things that they should get here and some they should wait until they reach England before purchasing:

"The officers should bear in mind that they are not coming to any permanent abode. They should bring only essentials, which include a pair of heavy Canadian shoe packs, soled, and knee-high—nothing to compare with them here; the frog of the Sam Browne, which must be worn here and which nearly everyone forgets and has to pay $2.00 or ... for; issue boots, if they can get them: their military manuals ... whole raft of sweaters, etc., for this fact must go ... he can only take one ...

The Gruelling Test of War

The author of the above has based his advice on the suggestions of fellow officers now in the heat of battle.

No more supreme test could be applied to Palmers Moose Head Brand shoe packs than service in the trenches—the verdict they earn is "Nothing to compare with them here."

If our shoe packs can "make good" on the firing line they can "make good" anywhere.

They are carried in stock and sold by the leading jobbers of footwear throughout Canada who will see you soon with 1917 prices. Reserve your orders for them.

FREDERICTON, N.B.

THE MOST MODERN MACHINE FOR SKIDDING LOGS OF ALL SIZES

The "LIDGERWOOD" Portable High Spar Skidder

Operating over the longest single span in the world—over 3800 feet

The portable spar is mounted upon a steel platform, and the spar can be readily lowered for moving. The platform can be either mounted on trucks, remaining on same during operation, or built with legs, and provided with hydraulic jacks which lift it off the trucks or car upon which it is moved from one setting to another, and allow it to straddle the track during operation, the empty cars passing underneath the machine to be loaded.

The engine equipment varies according to the requirements, methods of loading, whether by boom or guy line, guy tightening, car spotting, etc. We equip these skidders with engines adapted to meet every requirement. The main skidding engine and its auxiliary engine or engines may either be mounted on the same car with the spar or on separate car.

The LIDGERWOOD skidders are the only skidders provided with interlocking drums, and with a mechanical slackpuller.

The method of interlocking the drums makes it possible to suspend the logs at any height. They can be skidded with the ends dragging along the ground or entirely suspended.

This interlocking of the outhaul drum is done by one set of gearing, but when the outhaul drum returns the carriage a high-speed gear is thrown in and the carriage travels back at high speed.

When the carriage is run out into the woods with the skidding line the operator at the engine, by means of the slack-pulling drum, pays out all the slack that is required in the skidding line to reach logs lying on either side of the main cable. The slow and tedious pulling of the slack by hand is done away with and time and labor saved on each trip.

These two devices giving high speed outhaul, skidding with the load in suspension, a reduction of the strain on engines and cables, and a saving of time picking up each load, give high capacity, low cost for operation and maintenance, and handle the logs without damage to the timber.

We have paid special attention to the construction of Cableway Skidders required by conditions in British Columbia and the most successful machines now in use in that province were installed by us.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

Winnipeg Agents—Bisset & Webb, Limited, 151 Notre Dame Ave. East, Winnipeg, Man.

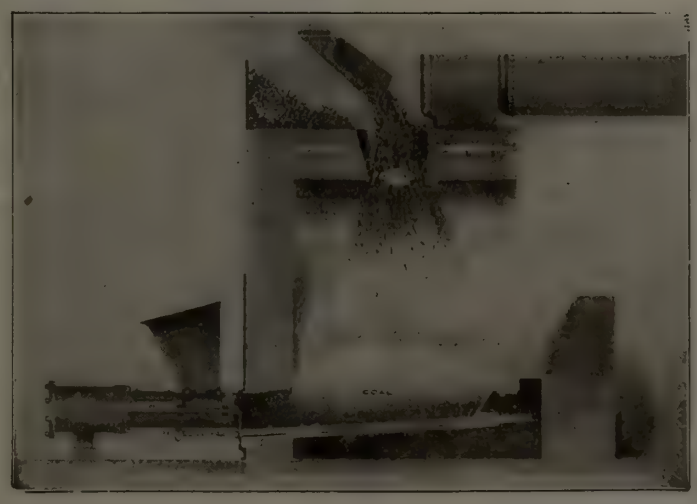
TURN YOUR REFUSE INTO FUEL

The disposal of waste in a saw, planing or pulp mill used to be an item of expense. By the installation of Jones Underfeed Stokers this waste can be used as fuel. The use of the Stoker equipment consumes as illustrated, the refuse and by the mixture of a small amount of coal a steady steam pressure is maintained. If you should run out of refuse or the mill conveyers break down, the change to coal fuel can be made instantaneously without any fluctuation of the steam gauge. One large pulp and paper mill reduced its coal bill 99 o/o with Jones Underfeed Stokers and the utilization of its mill refuse. Every mill cannot make such a colossal saving as this but substantial economy can always be effected with Jones Stokers.



Arrangement of Jones Underfeed Stokers in Dutch Oven for burning paper mill refuse in conjunction with coal.

What are the conditions in your mill? Let us talk to you.

JONES UNDERFEED STOKER CO., LIMITED

The "Clark" Single-Table Horizontal Resaw

Ever Consider Why These Machines are so Popular?

The possibility for fast and accurate production—is the answer

Some of the special features of the "Clark" Horizontal Resaw are—

The method of returning stock through machine, eliminating expensive return system—The use of the lower part of saw blade, this means the resaw sets on mill floor where every part is accessible. Entire table twenty-four feet long raises and lowers—Elimination of sawdust around wheels as all dust and bark passes through frame to conveyor below. Hand or Steam Set-works—Range of thickness from ½ in. to 14 in., made in two sizes, 66 to 84 inches.

Many other special features are described in our Resaw catalog. Mailed on request.

We will introduce Jan. 1st our New Portable Band Mill complete. If interested write us for Catalogue.

The International Makes A Perfect Pay-Roll

What do you pay a year for compiling pay-rolls? —a small fortune if you don't use an International

Just this item alone—pay rolls—is sufficient to make an International worth while in your plant. Each employee makes up his own pay in his own time by punching an International Time Recorder. When pay day comes you have a simple and accurate time sheet from which to work.

An International in your plant will have the moral effect of promoting co-operation, discipline and contentment.

There are 260 styles—one particularly suited to conditions in your organization.

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco," "Elk Steel," "St Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of
REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

Camp Lighting
By the
Carbic System

This Carbic Light will burn for twelve hours steadily, giving 2,000 candle power without refilling with Carbic Cakes—the handy new system of compressing raw Carbide. For Logging, Bush Work, Camp Lighting and Saw Mill there is no artificial light to equal "Carbic." We have sold hundreds to Lumber Camps, Military Camps, Corporations, etc., and every one gives perfect satisfaction. Expense of operation is small. Light can be regulated with our patented burner. Safe to operate and handle. Write for interesting catalogue and prices to the lumber trade.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa,
December 20th, 1912.

Deputy Minister.

There's No Better Proof of the worth of Spartan Belting than the work it is doing on difficult quarter-turn drives.

The unusual pliability of Spartan Leather enables the belting to operate successfully on short centres—hugging the pulley tightly when taking sharp turns over small pulleys, thereby transmitting maximum power most economically on the hardest quarter-turn drives.

The quarter-turn shown was designed by our own engineers, and to insure highest efficiency it was, of course, Spartan-equipt. These engineers are at your service, too.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

SAW MILL MACHINERY
ORILLIA, CANADA

No. 2 Lath Machine

WE have brought out our No. 2 Lath Machine with the view of meeting that ever increasing demand of mill men in Canada for a light, medium capacity Lath Machine, that will turn out a first quality product.

Made with a one piece frame just as our larger No. 3 Machine. All the parts are strongly constructed and have that easy accessibility that we have made a feature of all E. Long Company Machines. We believe this very feature has done a great deal to make the machines so popular with the trade.

Just as with our larger Machine, the saws are adjustable for ordinary lath or for pickets, staves, etc. In fact this machine will turn out work an exact counterpart of the No 3 Lath Machine, except in quantity. We shall be glad to give you further details and prices.

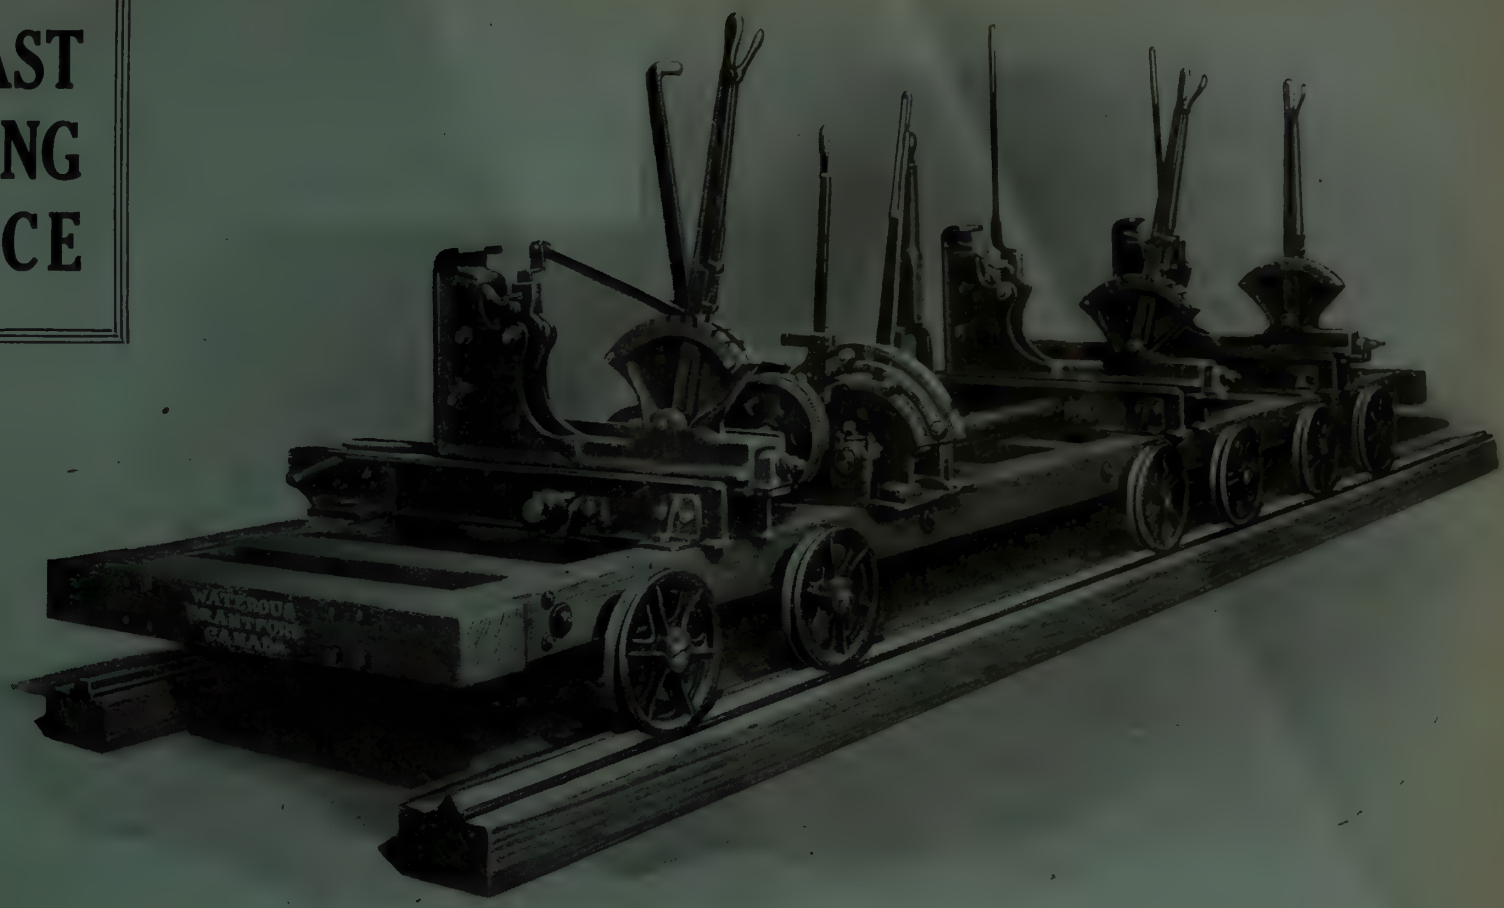
FOR FAST CUTTING SERVICE



Waterous Carriages

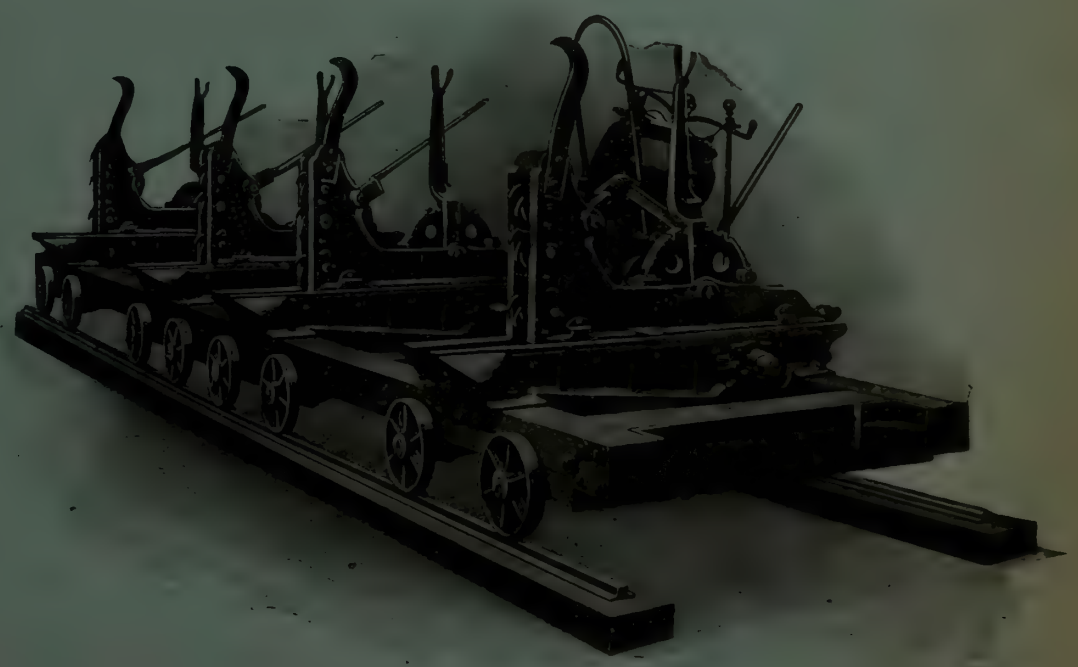
Steel Girder and All-Steel—For Every Size Mill

We build Saw Carriages.

Double Girder Carriages
With log openings of 24 in. to 50 in.

All-Steel Rack Carriages
With opening 36 in. to 72 in.

All Steel-Screw Carriages
With openings 60 in., 72 in., and 84 in.



No matter what size your mill or what kind of logs you are handling we have the right carriage for your use.

Our carriage equipment is of the very best. Waterous Dogs will hold the logs in place to stay; Waterous Setworks are accurate and durable; Waterous strength of construction will hold the carriage up to its work under the rack and wear of severe usage longer than most makes.

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

Power!

Who Pays the Power Bill? Who Pays for Pulleys?

YOU—the Management—pay for the power that drives your factory. And, remember—you pay for the power you *waste* as well as for the power you use. Exhaustive scientific tests prove conclusively that the actual cost per year for running *metal pulleys* as against *wood* pulleys averages *$5.00 per pulley.*

Dodge Wood Split Pulleys cost 40 per cent. less than metal pulleys and are 50 per cent. more efficient. They help you cut the cost of your power bills. Next time you require pulleys see that the "requisition" calls for ***Dodge Wood Split Pulleys*** and not for steel pulleys.

HAMILTON, ONT.

FOR SALE: Standing Timber, in Large or Small Blocks and Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery for sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 8-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.

1 Double cylinder steam nigger, right hand.

1 Log Loader for right hand mill.

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.

1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.

1 left-hand steam nigger.

1 Log-loader.

1 Endless chain jack ladder with two kickers complete for right and left hand mills.

2 Roger Gang Edgers for 8-in. cants and lumber.

1 Waterous double edger, 6 saws.

2 2-saw trimmers.

1 20-ft. Slash table.

1 16-ft. Revolving Slash Table.

1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works.

1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.

1 Lath Mill with bolter.

2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.

1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.

5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.

2 125 h.p. Water Wheels.

1 Upright Engine for sawdust conveyor.

1 10 h.p. Engine.

1 Wood Machine for 22-in. wood.

1 Edger for ripping dry lumber, installed.

1 80 h.p. Generator, 250 volt.

1 80 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

LINK-BELT

IS reliable in lumber mill service. H-110 has broad bearing surfaces on the bottom of the trough, to stand the wear of dragging. The end bar has a straight front to act as a pusher, and to prevent the tendency to ride up on the material.

T-head rivets are used, held securely between lugs cast in the side bar. Rivets are of .40 per cent. carbon steel, rolled true and smooth after forging. This process compresses the original hard scale surface, and materially increases the durability of the joint.

SATIN-LIKE INTERIOR TRIM

SOFT WORKABLE COMMON LUMBER

SEPTUM and SHORTLEAF

Assume yourself in the consulting room of a nose specialist:

Specialist—"Your trouble is in the Septum."

You—"Is that so. What's a Septum?"

Specialist—"The partition between your nostrils."

You—"Now I get you. You're speaking my language."

Assume a prospective layman home builder in your office:

P. H. B.—"What do you recommend for interior trim?"

You—"Shortleaf."

P. H. B.—"What's Shortleaf?"

You—"Well, Shortleaf — —" then for fifteen minutes you try to explain.

P. H. B.—"Oh yes; well, I'll let you know." (Exits.)

Now assume you watch your step. Enter the P. H. B.

P. H. B.—"What do you recommend for interior trim?"

You—

Arkansas Soft Pine

P. H. B.—"So you handle the Satin-like Interior Trim? I read about it last week in the **Literary Digest** and **House Beautiful.** The manufacturers recommend it for stains or white enamel, and I have written for their literature. Let's go out and look at some of it."

You, to yourself, as you go out the side door together towards the shed—"This fellow is already half sold on Arkansas Soft Pine. I'll make him a customer when he sees the stuff."

Look Here, Mr. Dealer.

We are offering you Profits on the Silver Platter of National Advertising. Our stock is known to legions of prospective homebuilders as Arkansas Soft Pine, Trade Marked.

Are you still calling it Shortleaf?
If so—why?

Do you drive a "horseless carriage"—or—an automobile?

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 36 Toronto, December 15, 1916 No. 24

A Merry Christmas to the Trade

The arrival of Christmas this year finds the lumber trade of Canada in quite a different condition from that which prevailed a year ago. Last year we were looking back upon a year and a half of war, and the lumber trade was not prosperous. The volume of business transacted during 1915 had been extremely light; prices had not been satisfactory and the outlook was uncertain. During 1916, although the war has continued with us, the pendulum of trade has swung back, and lumbermen have a good reason for celebrating Christmas this year in a merry manner. Leaving out of consideration for the time being the depressing conditions arising out of the war, the lumbermen of Canada to-day are well justified in taking full enjoyment out of the Christmas season, for the trade situation has changed for the better in a remarkable way since Christmas, 1915. The volume of lumber consumption has increased, the demand has strengthened and broadened, and, last but not least, prices of practically all lines have advanced, so that everyone, from the manufacturer to the retailer, is making a modest profit upon the stock he produces or handles. The probability is that these favorable conditions will be increased to some extent during 1917 by the increased scarcity of stocks arising out of the high cost of labor and supplies and the consequent reduction in woods operations. It is reasonable to feel, in fact, that the lumber trade has settled down into what may be considered as a normal war time condition, characterized by increasing operating costs, higher prices, and increasing inability of production to keep up with demand, all of which, though they involve a reduced volume of trade as compared with normal times, result in a sound trade situation. Unquestionably the outlook for the lumber trade at the end of 1916 is more encouraging than it has been at any previous time during the war.

We wish our readers a Merry Christmas for 1916 and a Happy New Year, with the hope that when Christmas comes again in 1917 trade conditions will be as favorable as they are to-day, and that they will have been supplemented by the blessings of a victorious peace.

Real Forest Fire Protection for Ontario

The announcement made by the Minister of Lands, Forests, and Mines for the Province of Ontario that his department is coming into line with those of several other Canadian provinces and adopting modern methods of fire prevention, so as to put an end to the enormous annual losses of standing timber, is a welcome piece of news. It means, we feel safe in predicting, that if the methods used in the other provinces are properly adopted and rigidly put into operation in Ontario, we have now experienced the last of our great conflagrations in the forest districts of Northern Ontario such as that which during the past summer wiped out of existence hundreds of settlers, together with their homes and effects, and caused incalculable damage to our standing timber. It means, too, that the families going into Northern Ontario to settle can depend in future upon practical protection against such calamities, and so feel encouraged to undertake the task of settling in the new country. Undoubtedly the prevention of forest fires will have the double effect of saving timber and giving a stimulus to settlement.

A great source of difficulty in the past has been the conflict of interests between timber owners, settlers, and prospectors, together with the inability of the individual settler to protect himself against the carelessness of others. This can now be entirely done away with. The time of year at which the Minister has made his announcement is a fortunate one, because between now and the next danger season in the summer of 1917 there will be time enough to arrange details and appoint the necessary staff to put the system into effect sufficiently to reduce greatly and probably almost eliminate the fire losses that we could otherwise predict with certainty for next year.

Elsewhere in this issue a report of the Minister's announcement is published, giving in detail the changes that are proposed. The announcement was made to a deputation arranged by the Canadian Forestry Association, which represented many important individuals and associations directly interested in the preservation of the standing timber of the province or in the prevention of forest fires. Some of the associations represented, such as the St. Maurice Forest Protective Association, Limited, and the Lower Ottawa Forest Protective Association, Limited, have already proved the adequacy, simplicity, and reasonable cost of modern forest fire fighting methods, and have given the Ontario department the benefit of their experience and co-operation. The trail has already been blazed by these associations, and it simply remains for the Ontario department to organize the necessary staff in order to place the protection of the province on an equal footing with the best system in North America.

The plan as outlined by the Minister is to create a branch of the Department of Lands, Forests, and Mines and to give it entire control of the fire prevention problem. The head of this department will be Mr. E. J. Zavitz, who has had long experience in connection with forestry problems in Ontario and is an excellent man for the position. Under Mr. Zavitz there will be a staff of inspectors and rangers. If the methods in use elsewhere are adopted, this staff will be organized in such a way as to provide an ample number of rangers, under a corps of inspectors, who will each be assigned a definite number of rangers to inspect. The percentage of inspectors to rangers will be greatly increased as compared with the present practice in Ontario. The rangers will be entrusted with the duty of patrolling for fires and enforcing the permit law which it is the intention of the Government to enact for the regulation of settlers' fires. A close season for setting out settlers' fires will be established, during which no fires will be allowed except with the permit of a ranger and in a ranger's presence. This provision has been the means of practically wiping out the danger from settlers' fires wherever it has been adopted, and in the course of a year or two the settlers have realized that the plan is greatly in their own interests. In some districts the settlers, appreciating the value of the protection they receive, have, of their own accord, assisted financially and otherwise in rendering the system more effective. Breaches of the permit law will lead to punishment by fine or imprisonment. Wherever this practice has been adopted

there have been a fairly large number of fines during the first year, a great reduction during the second year, and practically no fines during the third and subsequent years.

Supplementing the reorganization of the fire protection staff, the department will increase its equipment for fire prevention and fire fighting. It will build trails, telephone lines, and lookout towers in the woods, making it possible to locate, report, and reach a fire in the shortest possible time. All these improvements can be carried out at a surprisingly small cost. In fact, it is not unreasonable to expect that in the course of a year or two after the work of reorganization has been completed and the trails, lookout stations, and telephones increased in number, the cost of fire prevention will be easily within the amount expended at present for the same purpose.

The announcement of this change of policy on the part of the Ontario Government is the most important event in connection with the history of forest protection that has taken place in the province. The lumber industry and all those who depend upon it for their raw material will watch closely the carrying out of the scheme, and undoubtedly will give their fullest co-operation wherever it can be of service.

Western Retailers Great on Co-operation

In the prairie provinces of Canada retail lumbermen seem to be made of some different kind of material from those in Ontario and other parts of Eastern Canada. Recently the Canada Lumberman has taken upon itself to point out to the retailers of Ontario the self-evident truth that they have within themselves the power to improve greatly the conditions under which their trade is conducted, by forming an association and co-operating to bring about a number of reforms that are urgently needed and, at the same time, adopting progressive policies that will enable them to conduct their affairs more successfully and smoothly. One would think, if he had not had some experience to the contrary, that a proposition of this nature would meet with general approval and that it would not be a difficult task to put it into effect. However, this is not the case. We took considerable trouble in selecting a list of 100 of the best known retail lumbermen in Ontario. To them we sent a letter clearly outlining the proposition and asking for an expression of opinion, not for publication, but simply to guide us in deciding whether it would be advisable to call a meeting for the purpose of discussing the formation of an association of Ontario retail lumbermen. Of these 100 retailers some half-dozen replied in favor of forming an association, one or two were in doubt, and one opposed it directly. We followed this with a second letter to the same effect, and received a few more replies. We have secured in all, as a result of writing 200 letters, just ten replies favorable to an association, two or three expressing doubt, and one directly opposed. We presume that the balance of the retailers have thrown our letters into the basket. One would think we were trying to sell them something they did not want, or to rope them in for something not in their own interests.

So much for the retailers in Ontario. We do not try to explain their lack of interest in such a proposition; we simply give it up for the time being, but at the same time we will tell them a little about what is being done in the prairie provinces.

Elsewhere in this issue the retailers of Ontario will find a report of an address given to the Lumbermen's Section of the Toronto Board of Trade by Mr. A. B. Estlin, of Winnipeg, Man. In this report they will get an idea of what has been done in the West by men whose trade circumstances are in many cases similar to their own. The Western Retail Lumbermen's Association has given to its members service which is of direct money value to them far beyond the cost of membership, and it has been able, for this reason, to enroll in its ranks 80 per cent. of the retailers of Manitoba, Saskatchewan, and Alberta. The service given is of a varied nature. Plan books have been prepared containing plans, specifications, etc., of the chief lines of buildings required on the prairie, such as barns, silos, granaries, farm houses, etc., a number of examples of each kind being included. An architectural department furnishes individual plans and specifications that may be required. Estimating sheets, contract forms, etc., are provided. In fact, everything is done to simplify the task of the retailer in converting a prospect into a customer and satisfying him that he is getting good value for his money. An insurance department has also been established, which has reduced greatly the cost of carrying insurance upon retail yards. All this has been done with the least possible amount of trouble to the members themselves. In fact, the members find that co-operation of this kind simply involves the payment of a comparatively small membership fee, sufficient to provide for the employment of a competent staff, and that such a staff can handle everything satisfactorily. So far as meetings are concerned, practically only one meeting a year is found necessary. Everything works automatically.

What is the difference between the retailers of the prairie provinces and those of Ontario that the latter cannot work together also? Of course, the prairie yards are mostly yards only; very few of them conduct planing mills in addition. But, generally speaking, the business problems are on a similar plane, and we cannot see any reason why Ontario retailers should not prove themselves just as live and progressive as those of the West. The simple state of affairs is, that, up to date, they have not done so, although we have sought frequently to point out to them the value of such co-operation and have shown them how it has worked out successfully elsewhere. If anyone knows how to explain this puzzle we would like to hear from him.

Reciprocity Results Without Any Formal Agreement

About six years ago President Taft and Sir Wilfrid Laurier were engaged in the exchange of negotiations looking toward the passage of a reciprocity treatment between Canada and the United States, which was quite agreeable to the people of the United States at that time, but did not meet with the approval of the people of Canada. Of the merits of that proposal from a Canadian point of view there is little to be said to-day, as the whole question is dead and buried, but of the simple fact that two such nations as Canada and the United States can confidently leave it to their industrial and commercial leaders to develop their mutual interests whenever feasible, in a manner which puts into effect many of the advantages the reciprocity arrangement might be supposed to promote, we have lately had an exceptionally interesting illustration. During the past few weeks developments have taken place in the pulp and paper industries of Canada and the United States that clearly indicate the readiness with which industrial changes will take place along the line of least resistance, so long as they are reasonably free to do so. Two events in particular illustrate this point. One is the acquisition by the Riordon Pulp and Paper Company, Ltd., Montreal, of the Ticonderoga Pulp and Paper Company, Ticonderoga, N.Y. The other is the purchase of the mill and timber lands of the Partington Pulp and Paper Company, St. John, N.B., by the Export Paper Company, Rumford, Me., and the Bryant Paper Company, Kalamazoo, Mich. The latter two companies have joined hands in the purchase of the Partington properties, and have incorporated their newly acquired plant and business under the name of the Nashwaak Pulp and Paper Company.

One does not need to seek far for reasons for these developments. The Nashwaak Pulp and Paper Company will produce pulp at St. John, N.B., and will furnish the Export Paper Company and the Bryant Paper Company with raw material for their large outputs of paper. A similar motive unquestionably prompted the other deal, that by which the Riordon Company acquired the Ticonderoga plant. On the one hand we have a company that has enormous quantities of pulp and is anxious to secure a paper mill and on the other hand a

company that is manufacturing large quantities of paper but lacks a pulp mill. The parties to these deals are undoubtedly preparing to turn out their finished product in its most complete form with as full control as possible over all the manufacturing processes from the raw material to the article ready for the consumer. The fact that an international boundary happens to exist between the sites of the different plants does not affect the necessity or the wisdom of the deal, and it has not required any reciprocity encouragement to bring about either transaction. The irresistable logic of events has resulted in concrete examples of a proposition which it was not possible for the governments of the two countries to persuade the people of Canada to foster artificially. The wisdom of letting well enough alone seems to have been amply demonstrated, as we in Canada are now securing, without the giving of any quid pro quo, the advantages that we would have secured by the enactment of a reciprocity agreement.

And when one comes to analyze the situation, does it not come down to a very simple one, namely, a statement that industry can be depended upon to seek its own best interests without artificial regulations providing for the giving and taking of just those considerations which will be exchanged as a result of the laws of supply and demand? Moreover, we have in both these deals a very definite proof of the fact that Canada does not need to seek favors of anyone in connection with the marketing of its raw materials for the production of paper. We are logically the great source of supply for such raw materials for the whole of North America and for other markets as well, and yearly our strategic advantages in this connection are becoming greater as the supply in other countries is depleted. So far as we in Canada are concerned our problems in connection with pulpwood, pulp, and paper will be to increase the amount of manufacturing carried on in Canada until we turn a much larger percentage of our pulpwood and pulp into paper, instead of exporting them to mills in other lands. Under present conditions we are obliged to send out large quantities of pulpwood and pulp to the paper mills of the United States, but these mills are daily being obliged to get in closer touch with the sources of raw material in Canada, even to the extent of buying up large quantities of Canadian timber and purchasing Canadian mills. The two instances reported above are straws showing the direction of the wind and foretell a continually increasing tendency on the part of the pulp and paper industries of Canada and the United States to get together in order to make the most out of the timber resources of Canada. This way of bringing about reciprocal trade developments is infinitely better than an artificial method.

Editorial Short Lengths for Busy Readers

Ever since it first appeared as an article of luxury, there have been frequent statements that the automobile has been a damage to the lumber business because of the expensive habits it induced and the supposed dissipation of savings that might otherwise have been invested in home building.

Sometimes it is worth while to look at the other side of the question. There is an active organization of the lumber purchasing agents for the automobile factories, and these gentlemen insist that on the basis of the present production, they are buying annually 500,000,000 feet of hardwood lumber, chiefly maple, elm, birch and ash, and that in addition large quantities of yellow pine and other softwoods are used for the crating and boxing of machines for export.

One prominent automobile manufacturer alone is now purchasing fifty million feet of lumber per year; one large manufacturer of automobile bodies will need forty million feet of lumber during the coming twelve months, and another body manufacturer is using twenty million feet yearly, chiefly maple and elm, but also some sap gum and sound, wormy oak; another body maker is using ten million feet yearly of elm, gum, ash, maple and poplar. One manufacturer of automobile wheels is using the equivalent of twenty-six million feet of hickory a year, and another very large wheel manufacturer says that the average set of automobile wheels contains about 33 feet of hickory—so figure it out for yourself.

And then there are garages. There are now three million automobiles in the United States. The average one-car garage, if built with wood, takes about two thousand feet of lumber. Nobody knows how many garages have been built or will be built next year, but there will be a tremendous number of them, and a vast amount of lumber required in the aggregate.

If you are a prospective garage builder, write to the National Lumber Manufacturers' Association for the latest publication entitled "Your Garage—How to Build It." It's all meat and easily digested. Whatever you do, don't send away for a ready-made metal garage. It will cost you about twice as much as a wooden one and will be half as satisfactory.

Mr. J. C. Manzer, special representative of the New Brunswick Government in Havana, Cuba, has forwarded the following information on the lumber situation in Cuba: Stocks of lumber are considerably reduced and prices are firm. Consumers are paying from $8 to $10 per M. more for all grades of lumber than they were paying one year ago. Cuban lumber dealers recently received notice from exporters in the United States that they were preparing to ship 1,000,000,000 feet of lumber to Europe the first year after the close of the war. Up to the commencement of the war the United States was shipping to Europe about 100,000,000 feet annually. Dealers here consider this notice as a preliminary to another increase in price. Among the cargoes of lumber arriving recently was a large schooner loaded with spruce from Bathurst, New Brunswick.

The highly valuable white pine forests of Ontario, Quebec, and New Brunswick are in danger of extinction by the outbreak of white pine blister rust, a disease originally brought over from Germany on pine seedlings. Infected areas have been located in Ontario—in the Niagara Peninsula, and in Simcoe, Durham, Wellington, and Victoria Counties. In Quebec several outbreaks have been found near Montreal. An investigation has been under way for some months by provincial government officers, but to prevent another disastrous visitation such as cleared off most of the tamarack and chestnut trees the most vigorous measures will have to be taken by all governments, lumber companies, and individuals. The disease spreads through gooseberry and currant bushes, which are used as a "host" plant. The rust forms yellow patches on the under side of the leaves, then develops late in June into spores on the currants and berries, and is carried by the wind to the white pine. No preventive is known other than destruction of the two kinds of berry bushes and of all five-needled trees found to be infected. The governments of the Eastern States have made appropriations for an immediate campaign to locate diseased sections and to suppress the infection.

The Canadian Pacific Railway and Mr. H. H. Stevens, M.P., are having an interesting and important dispute regarding the ownership of a lot of property on the water-front at Vancouver, Mr. Stevens claiming that the Canadian Pacific Railway is holding much of this property illegally and collecting rents from those who occupy it. A number of lumber and shingle companies are closely interested in this dispute, having their plants located on the property in question. These include the Hanbury Mill Company, the Cotton Shingle Company, the Imperial Shingle Company, the False Creek Lumber Company, the Alberta Lumber Company, the Rat Portage Lumber Company, the Cedar Cove Sash and Door Company, Ltd., J. Chew, and the British Columbia Fir and Cedar Lumber Company. Mr. Stevens claims that the ground belongs to the public, and that the C.P.R. is drawing rentals from it amounting to $80,000 a year.

Leading Southern lumber exporters have decided to fill orders for European cities promptly and to charter ships, if necessary, to move the cargoes. The export committee of the Southern Pine Association took action after J. W. Drewry, European agent, said he had orders for more than 100,000,000 feet of lumber, cross ties, and other forest products.

Ontario Adopts Modern Protection

Minister Announces Improved Fire Prevention Plan Including Settlers' Permits, Telephones, Etc.

An important announcement was made by Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines for the Province of Ontario, to a deputation which waited upon him recently, to urge further and more efficient methods for the protection of standing timber from fire. The deputation was arranged by the Canadian Forestry Association, and included prominent representatives from all the industries interested in the forest products of Ontario, both from a manufacturing and consuming point of view; also representatives from Boards of Trade, banks, fire insurance companies, etc. The request of the deputation was divided under several heads. The chief suggestions were that fire rangers should be given complete control over settlers' clearing fires, by the enactment of a "permit" law; that control of the rangers should be centralized under a skilled manager and a capable inspection staff of sufficient size to make frequent inspections; that the work should be facilitated so far as possible by the use of modern mechanical equipment, including trails, telephones, lookout towers, etc.

After listening attentively to the addresses of a number of members of the deputation, Hon. Mr. Ferguson said that the Governmeent could only work out a successful system of administrating the forest resources of the province with the co-operation of those who were interested in their preservation and use. After he had come into the department as its Minister, one of the subjects to which he had devoted considerable study was that of forest protection, and fire prevention in the north country, and they had fairly well developed an extended and reorganized system, when the clay belt fire calamity of this year overtook them. The conditions prevailing at the time of the fire were unique, but, of course, it was not dealing with the question of prevention of fire or control of its origin, to analyze those conditions. In fact, the province needed some change in the methods of handling the problem, as compared with those of a few years ago. In earlier days it had been largely a question of administerating the timber resources. Mining had developed, however, and, more recently, increased attention had been given to colonization work. The government had endeavored to meet all these changing conditions as fully as possible. During the past year they had placed about 1,400 settlers in Northern Ontario. The settler was essentially an asset to the development of the country. He would not like the public to think that the Government had done nothing, however, in the way of developing further fire protection for the fire resources. They had, in the Nepigon reserve, established a very efficient system and had developed along similar lines in other districts.

The department had now come to the conclusion that it would be necessary to readjust the whole fire protection system, so as to meet the conditions prevailing at the present time. He had had correspondence with a number of lumbermen, and interviews and communications with the different governments, upon this subject, had collected all the information he could, and now had pretty definitely arrived at a conclusion regarding the future. The intention of the Government was to establish a separate branch of the Department of Lands, Forests and Mines, that would deal entirely with the questions of forestry, fire prevention and protection. There would be a head of the branch with entire control of the whole work. He would be given a wide range of authority, an ample staff of competent men and all the means necessary to see that the requirements of the situation were carried out. He had also reached the conclusion that the only way in which they could secure actual control of settlers and others in the north country was by adopting some system of permits or control of fires set out during the close season. He thought also that they would have to extend their telephone systems and lookout tower systems. Perhaps they would appoint a few mounted rangers. The whole problem was one of getting together and concentrating their fire fighting forces as soon as a fire was discovered. Up to the present time the department had spent a very large sum of money on fire protection and proposed to continue doing so. The justification of such expenditure could not be questioned by anybody.

It is understood that the Government intends to appoint, as the head of the new branch of the Department, Mr. E. J. Zavitz, who for many years has been in charge of the Forestry section of the Lands Department.

The deputation which waited upon the Minister was arranged chiefly by Mr. Robson Black, secretary of the Canadian Forestry Association, and included among others: Lt.-Col. J. B. Miller, president of the Canadian Forestry Association, who introduced the speakers; Sir Edmund Walker, President Canadian Bank of Commerce; W. E. Bigwood, President Canadian Lumbermen's Association; J. C. Elliott, Kingston, President Canadian Press Association; Ellwood Wilson, Grand'Mere, P.Q., President St. Maurice Forest Protective Association; Mr. Arthur Hewitt, President Toronto Board of Trade; James White, Commission of Conservation; T. H. Hall, Vice-President Canadian Fire Underwriters' Association; S. R. Parsons, Vice-President Canadian Manufacturers' Association; Mr. T. C. Young, timber manager of the Canadian Northern Railway; ex-Controller James Simpson, Toronto.

Strong Objections to Demurrage Hearing

Urgent representations were made recently to the Dominion Board of Railway Commissioners by lumbermen in many parts of Eastern Canada, to the effect that the proposed hearing of the railway companies' application for permission to increase demurrage charges from $1 per day to $4 per day, and reduce the free time on lumber from 72 hours to 48 hours, which was to be held on December 11th, gave no time to prepare a case against the railway companies. The Canadian Lumbermen's Association, the Lumbermen's Section of the Toronto Board of Trade, and the Montreal Lumbermen's Association all sent in protests. Sir Henry Drayton, chairman of the Board of Railway Commissioners, advised the railways and the shippers to try to arrange a compromise. A number of conferences were held on December 12 and 13, and finally an agreement was reached to the effect that the free time on lumber should remain at 72 hours, but that the demurrage charges should be as follows: For the first day after the free time, $1; for the second day, $1; for the third day, $2; and for the fourth and subsequent days, $5. It is expected that this arrangement will be ratified by the board. This, of course, is a temporary arrangement, to last only until April 30, 1917.

British Columbia Timber Report for October

The timber returns for the month of October, issued by the British Columbia forestry branch, show the total scale of sawlogs for the province to be 156,412,875 feet board measure, in addition to 571,631 lineal feet piles and poles, and 21,294 cords of shingle bolts, posts, ties, etc. The returns according to each forest district are as follows: Vancouver, 107,517,336 feet sawlogs, 102,595 lineal feet poles and piles, and 11,578 cords of bolts, etc.; Island district, 15,064,214 feet sawlogs, 32,968 lineal feet poles, etc., and 727 cords of bolts, etc.; Nelson, 14,484,160 feet sawlogs, 200,495 lineal feet poles, etc., and 2,031 cords of bolts, posts, etc.; Cranbrook, 11,334,310 feet sawlogs, 39,230 lineal feet poles, etc., and 6,373 cords of bolts, etc.; Prince Rupert, 3,217,636 feet sawlogs, 66,462 lineal feet poles and piles, and 562 cords of bolts, etc.; Vernon, 2,189,021 feet sawlogs, and 10,200 lineal feet poles and piles; Kamloops, 1,583,658 feet sawlogs, and 8,277 lineal feet of poles and piles; Fort George, 1,170,662 feet sawlogs, and 44,217 lineal feet poles, etc.; Hazelton, 124,878 feet sawlogs, and 67,187 feet poles, etc.; and Lillooet, 27,000 feet sawlogs. Timber sales recorded during the month of October cover an estimated total of 9,678,097 feet sawlogs, and 50,000 lineal feet of cedar poles, estimated to produce a revenue amounting to $17,174,000.

Beach Combers to be Severely Handled

An interesting judgment was recently given by Judge McInnes at Vancouver, B.C., in connection with the prosecution of a man named Charles Dorey for "fraudulently keeping in his possession logs belonging to the Vancouver Lumber Company." The prosecution was brought under an act placed upon the statute books about three years ago, and recently amended, making it an indictable offence, with liability to three years imprisonment, for anyone, without the consent of the owner, fraudulently taking, collecting, keeping, or selling any timber, mast, spar, saw log, or shingle bolt found adrift or cast ashore in Canada. This was the first prosecution under the act, and the judge was lenient with the defendant, expressing the opinion that it was rather hard upon him to be made an example of when probably he had no intention of infringing the law. Accordingly, he imposed only a moderate fine, but he pointed out that future offenders would be dealt with more severely, the act having been passed for the protection of th lumbering industry.

Toronto Lumbermen Will Hold a Banquet

At a recent meeting of the Lumbermen's Section of the Toronto Board of Trade it was decided that a lumbermen's banquet should be held in Toronto during the week between Christmas and New Year's, to which all lumbermen and members of several affiliated trades should be invited, including the dealers in builders' supplies. It is expected that a very large attendance will be secured and that the occasion will be the most interesting and successful of its kind that has ever been held in Toronto. A special banquet committee was appointed, consisting of Messrs. W. F. Oliver, A. E. Clark, A. K. Johnson, and H. Boultbee. A special programme will be carried out, and a number of good things will be arranged in the way of entertainment.

The citizens of Brockville, Ont., recently gave a banquet in honor of the 230th Forestry Battalion, stationed at that point.

Western Retailers Doing Good Work

Plan Books, Blue Prints, Specifications, Etc., Furnished at Cost—Insurance Rates Reduced.

At one of the recent weekly meetings of the Lumbermen's Section of the Toronto Board of Trade an excellent address was delivered by Mr. A. B. Estlin, of Winnipeg, Man., formerly president of the Western Retail Lumbermen's Association, and one of its board of directors for many years.

Mr. Estlin, in opening his remarks, stated that the Western Retail Lumbermen's Association was now about 27 years old, and it enjoyed the largest representation it had ever had. It included retailers from the three prairie provinces of Manitoba, Saskatchewan, and Alberta, and 80 per cent. of the yards were represented. During the last two or three years the association had made very considerable progress, and was now taking up vigorously the work of educating both its own members and the public in regard to improved methods of doing business.

One of its most important steps had been the recent adoption of the plan book business. The association was now getting out the second edition of this plan book, in which plans and full information were given regarding all the usual types of buildings required in the prairie provinces, such as granaries, silos, barns, houses, etc., a limited number of each class being included. In connection with each plan prices are given based upon the average prices of everything that goes into the construction of the building, and owing to the number of books the association had got out they were able to furnish them to their members very cheaply. The plans included were specially suitable for prairie customers, and were all prepared by the association's own staff. The buildings represented had all been actually erected, and the prices, details, etc., were checked up and corrected from actual results. Thus as the work proceeded and new editions appeared the plans were improved according to the experience obtained. The association was very proud of its plan books because everybody else was copying them. The books were being handed out practically at cost, and they had gone even further than this, having established an architectural department. When any lumberman got a customer who intended to put up a building he simply had to give the association a rough sketch of the building on a piece of paper. The staff of the architectural department would then make him out a set of plans, blue prints, and specifications. In addition, the association furnished a book of quantities for each type of building shown in its plan book. Not content with all this, they had also drawn up and were furnishing a standard estimating sheet which was adaptable to every kind of building. All these lines of service had proved of great assistance to the trade in general.

Another line of work the association had taken up was in connection with insurance on retail yards. About ten years ago the retailers in the prairie provinces had been suffering greatly from the high price of insurance upon their yards. The basis rate of the board companies at this time was $2.50 a thousand, and the exposure charges also were very high. The average cost of insurance was probably about $3.50 a thousand. That was a very heavy charge because the retailers had to carry large stocks. So the idea was conceived that they should get up an insurance company of their own. In order to start it they had to have a little money, and as they had none at that time, they proposed to the board of directors of the association they should lend the insurance institution $10,000, not to be used, but as a basis of credit, upon which a fair rate of interest should be paid. This matter was arranged and the insurance plan was worked out. It was figured that in order to put the plan into successful operation at once it would be necessary for each man to pay in an amount equal to the insurance premiums that he would be paying under a board company rate, this amount to be considered as a guarantee. This step was taken as a precaution to enable them to call up to that amount and not hurt the insurer during his first year. The money thus secured was called the guarantee premium deposit. The association had kept up this plan every year since, but as the basis rate decreased the amount of this deposit also decreased. Instead of $2.50 a thousand, which was the rate during the first year, it had now been brought down to 75 cents.

The association have at the present time about $3,000,000 of insurance in force. They had repaid the $10,000 borrowed from the board of directors of the association, and, roughly speaking, they had $40,000 or $50,000 of capital. Moreover, they had never had to make a call that in any way approached what the board companies had been charging. Last year and for the previous four or five years they had paid 48c. Insurance on his own company's yard at Melita, Man., which had formerly cost them $350, was now costing them only $48, and, in addition to that, instead of having a whole lot of trouble if they had a fire loss, being lumbermen themselves, the policy holders were dealt with as brother lumbermen, and the practice was to give them as fair an adjustment as possible.

Another feature of the insurance plan was that they only covered up to $7,000 in any one yard. They had been able to get other companies to take the excess insurance which they did not carry themselves. Of course, the assocation also made a charge for exposures, like any other companies. During the past year they had not made losses in excess of previous years, although there had been a far greater moral risk than in the days before the hotels went out of business. He could not explain this difference, but statistics showed that it existed. Their latest statements showed that they had about $5,000 surplus on the season's business.

The work of the insurance department had been wholly voluntary on everybody's part, with the exception of the staff, consisting of the secretary and stenographer. All the rest of the work had been done by the members of the association free of charge. As an association, therefore, with the excellent record they had made, they felt very proud of their work.

At the conclusion of Mr. Estlin's address a number of questions were asked and an informal discussion took place. The chairman, Mr. J. B. Reid, expressed the thanks of the Lumbermen's Section of the Board of Trade for Mr. Estlin's instructive address.

Going After Freight Rate Refunds

Toronto Lumbermen Ask Railway Commission to Make Railways Pay Back All Overcharges.

At the meeting of the Lumbermen's Section of the Toronto Board of Trade, held on December 8, Mr. J. L. Campbell introduced a discussion upon the subject of freight rebates, drawing attention to the established policy of the railway companies to delay and, whenever possible to avoid, the payment of refunds for excess freight charges improperly collected. Mr. Campbell referred to the difficulty experienced by all shippers in following this matter up closely. Lumbermen could not all be experts in the matter of freight rates. Sometimes they were charged excessive rates without knowing it. Whenever they did make the discovery that they had been overcharged and wrote to the railway company pointing out the error, the latter would acknowledge receipt of the letter and that would be the last they would hear of it unless they kept after the railway company. Then they would get another letter saying that the matter was being taken up further. From three to six months would pass by without anything being done, depending upon the laxity or diligence of the shipper. If he did not keep after the railway company to the very end he would never get his money.

There was a great grievance here that ought to be remedied. In many cases the local freight agent made mistakes in figuring the charges. Sometimes these mistakes were overcharges and upon rare occasions they were undercharges. The auditor of the railway company, in examining the books, would come across these mistakes. If he found that the shipper had been undercharged the railway company never lost sight of him until it got the rest of its money. The auditor who located these undercharges must, of course, also find the overcharges. If the railway companies were permitted to come back on the shippers for undercharges they should also refund the overcharges. However, this was not done. As a matter of honesty it should be done. If the auditor found an overcharge and the railway company buried it it really became a crime. It seemed to Mr. Campbell that it would be a wise thing to take some action to make the railway companies adopt an honorable policy in this regard.

There was a similar case to be found in the matter of unclaimed bank balances. The banks, however, made some attempt to find the man entitled to the money. By reason of these balances being left in the banks they accumulated to a very substantial sum. This money did not belong to the banks, and as it came from the people at large it should be returned to the people. A law had been passed obliging the banks to hand this money over to the government. Mr. Campbell could see no reason why the same rule should not apply to the railway people. When the auditor found an overcharge he should make a note of it and send in a return regarding it to the railway people. The railways should then return the money to the shipper, and, if the latter could not be found, they should hand the money over to the state. This would be a fair deal for the people.

That the amount of money improperly retained by the railway companies in this manner was very considerable was clearly shown by the fact that numerous companies had been estabilshed for the purpose of checking over freight bills and making claims against the railway companies. These companies did a good-sized business and secured a considerable amount of money, showing that the amount taken from the pockets of the people unjustly was very large.

After Mr. Campbell's discussion of the matter several other members expressed their approval of his remarks, and many definite instances were given of the action of the railway companies along this line. It was finally decided that the secretary of the section should write to the secretary of the Dominion Board of Railway Commissioners asking them for a hearing upon this subject.

Personal Paragraphs

Mr. Harry Brown of the Atlantic Lumber Company, Toronto, who enlisted as a private with the 15th Battalion of the first Canadian contingent, has secured a lieutenancy.

Mr. E. H. Woods, who was connected with Messrs. Frank Harrison & Co., of Liverpool, as their American buyer, has joined the staff of W. N. Hillas & Co., Hull and West Hartlepool, England.

Mr. Harold Kennedy, of Quebec, who owns large lumber interests in the province, including timber limits, has been elected a director of the Bank of Montreal. Mr. Kennedy recently equipped a military hospital in Maidstone, Engand.

Col. A. D. McRae has been appointed acting quartermaster-general of the Canadian forces in Great Britain. Col. McRae will be remembered by lumbermen as the managing director of the Canadian Western Lumber Company, Fraser Mills, B.C.

Mr. B. Russell, of Toronto, one of those interested in the Gordon Development Company, holding 450,000,000 feet of timber in Sechelt Peninsula, visited Vancouver recently and also inspected some of the company's timber property, where logging operations are now in progress.

Major Austin Bain Gillies, Carleton Place, Ont., who went overseas in command of a Toronto battery and is well known to the lumber trade of Ontario, was recently included in the list of wounded. Major Gillis is 31 years of age, and has been connected with the Canadian Field Artillery for about ten years.

E. F. Duby, general superintendent at the Brunette Saw Mills, New Westminster, B.C., left recently for Prince Rupert, where he will have charge of the erection and operation of the sawmill which is being put up by Mr. J. S. Emerson, of Vancouver. On the eve of his departure Mr. Duby was presented with a handsome gold watch by the operating staff of the Brunette Mills.

Obituary

E. T. Nesbitt, a well-known lumber merchant and contractor of Quebec, P.Q., died at the General Hospital, Montreal, recently, at the age of 62. The late Mr. Nesbitt was the fonuder of the Quebec Builders' Exchange.

Second Lieutenant James Douglas Aiken, Royal Field Artillery, is reported killed in action. Lieutenant Aiken graduated in January from the Department of Forestry, University of Toronto. He was the second son of Mrs. J. H. Aiken, 23 Alma Street, London, Ont.

W. H. Rourke, for many years a prominent resident of St. Martins, N.B., and a leading figure in the shipping and lumbering industry of New Brunswick, died recently at St. John, after an illness of three weeks, at the age of 90.

Alexander Gordon, Pembroke, Ont., father of Senator George Gordon, of George Gordon & Co., Ltd., Cache Bay, Ont., died suddenly at his home recently. The late Mr. Gordon was 81 years of age, and moved to Pembroke in 1866. Until recent years he had been extensively engaged in the lumber business, under the firm name of Booth & Gordon.

The Western Retail Lumbermen's Association will hold its annual convention at Winnipeg on January 24, 25, and 26, these dates being a little earlier than usual.

Plan for Single Band Saw Mill

Herewith are submitted the plans of what I consider one of the most successful single band mills in the country. In erecting a new mill the question arises, how to arrange it for convenience as well as to avoid unnecessary labor expense. Anyone contemplating the building or rebuilding of a single band will do well to consider the arrangement shown in the sketches.

The engine and boiler rooms, as well as dust room, can be located at will, but should not be directly connected with the mill building. If possible, the engine and boiler room should be located on the left-hand side of the building, while the filing room should be on the right-hand side, as shown at arrows.—R. C. Leibe, in The Woodworker, Indianapolis.

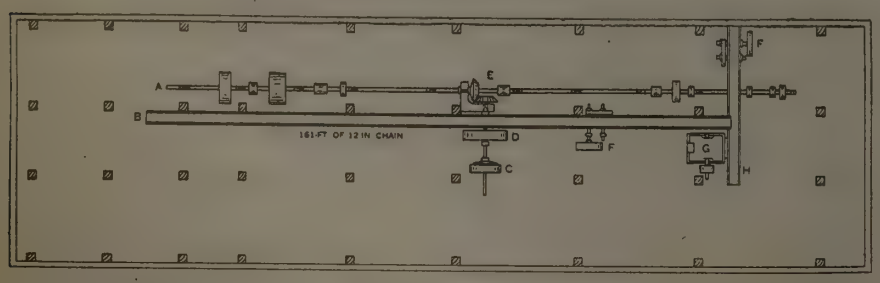

Fig. 1, Plan of lower floor — A, main lineshaft; B, dust conveyor; C, hog drive pulley; D, edger drive pulley; E. gear drive; F, conveyor drive; G, hog; H, conveyor.

Montreal Lumber Association Annual Meeting

Mr. Arthur H. Campbell presided at the annual meeting of the Montreal Lumber Association, held on December 4th at the Board of Trade. In his report Mr. Campbell referred to the increase in railway freights east of Port Arthur, including those on lumber, which was asked for by the companies in February, 1915. The proposed advances were: In cases where the rate was 15 cents or lower, ½c advance; over 15 cents but not exceeding 25 cents, 1c advance; over 25 cents but not exceeding 35 cents, 1½c advance; over 35 cents but not exceeding 45 cents, 2c advance. The association was represeented at the hearings in Montreal, Ottawa, and Toronto by Mr. P. D. Gordon, Mr. W. A. Filion, the president, and other members, and by the manager of the transportation bureau. After more than a year's consideration, the Board of Railway Commissioners granted the increases asked for, and the advanced rates became effective on December 1st. The judgment, however, provided that the present difference between the local rate and the export rate must be continued. Reference was also made by Mr. Campbell to ocean rates, which during last winter advanced to 400s. per standard, and then steadily declined until September, when they were down to 200s. From that date they again advanced, ranging from 300s. to 325s. at the close of navigation.

A few days ago the railway companies applied to the railway commissioners for an amendment to the Canadian car service rules so as to provide that the demurrage charge for each 24 hours, as provided in rule No. 1, be increased from $1 to $4, and that the additional 24 hours beyond the 48 hours free time allowed for loading or unloading, amongst other goods, boards, deals, and scantlings, be cancelled. The lumber trade is most strenuously opposed to the railways' application, being of the opinion that the car shortage is attributable, not so much to the misuse of cars as storage houses by the shippers as to the failure of the railway companies to add sufficiently to their rolling stock during the last two or three years, to the shortage of labor, and to the heavy business offering as a result of the war. When trade is so handicapped and consumers are suffering to such an extent by reason of the phenomenal advances in the prices of all necessaries of life, it was most inopportune to allow of the further handicapping of trade and additional increases in the cost of carrying on business. The hearing was fixed for Monday, December 11, in Toronto. Conferences were held at Toronto on December 12 and 13, resulting in a compromise arrangement, as reported elsewhere in this issue.

The president expressed deep regret at the loss by death of Mr. George J. Esplin, one of the charter members of the association, and of Mr. G. A. Grier.

The following officers were elected: President, Mr. Arthur H. Campbell; vice-president, Mr. P. D. Gordon; treasurer, Mr. F. W. Cotter; directors, Messrs. George Grier, D. H. McLennan, W. A. Filton, and T. J. Rutherford.

Otto Dahl, of Philadelphia, Pa., was in Vancouver, B.C., recently, in order to close shipbuilding contracts to the amount of about $5,000,000, which will entail the employment of 1,500 to 2,000 men. The ships are to be built by the Wallace Shipbuilding Company and by Messrs. Coughlan & Company at their proposed yards on False Creek. Six ships are to be built at the Wallace yards, each registering 8,800 tons. They will be steel steamers. It is expeeted that other contracts will follow these.

"Your Garage—How to Build It," is the title of an attractive and practical booklet published by the Trade Extension Department of the National Lumber Manufacturers' Association. The booklet has been prepared by C. R. W. Edgcumbe and contains complete information and plans for the guidance of automobile owners who wish to erect single, double, or more extensive garages.

A report from Sussex, N.B., states that operations in the woods have already commenced in that district, and that there has been a sufficient snow fall for hauling operations to be undertaken. This is a record in regard to the early commencement of operations in that locality ,and it is thought that the operators will get through their work exceptionally early.

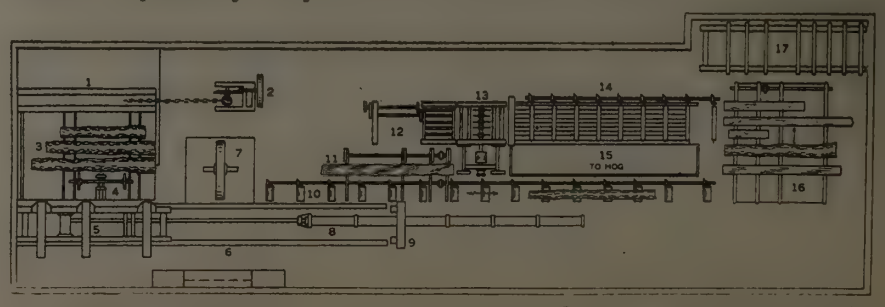

Fig. 2, Plan of upper floor—1, log conveyor chain; 2, chain gear and drive; 3, log deck; 4, steam kicker; 5, carriage; 6, carriage track; 7, band mill; 8, shot gun feed; 9, bumper; 10, live rolls; 11, transfer chain; 12, edger table; 13, edger; 14, live rolls; 15, hog chute; 16, chain conveyor, 17, trimmer

Stave Production in Nova Scotia

Materials Used and Manufacturing Costs—Market Situation Disturbed by War Conditions

Editor Canada Lumberman:—Can you give us any information as to the manufacture of wooden barrels and other packages, the kind of wood used for staves and heads, and other material required, labor necessary, and the prices obtained for the finished product? If you can give us any information on these points, or put us in touch with anyone who can, we will appreciate it very much—Colonial Lumber Company, Antigonish, N.S.

Information in reply to this question was published in our issue of December 1st. To this we are able to add the following information furnished by the Sutherland, Innes Company, Limited, Chatham, Ont.:

The principal timbers used for the manufacture of wooden barrels are as follows:—

For staves—Elm, birch, spruce.
For heading—Basswood, hardwood and spruce.
For hoops—Elm.

The principal timber used is mentioned first in each case. Prices will be governed by quality, proximity to market, and market conditions. There are no fixed prices. This firm would probably want to manufacture principally spruce staves, as they have little elm in their vicinity.

Information we have received from an experienced manufacturer in Nova Scotia is to the effect that they manufacture staves from spruce and fir, and heading from spruce, fir and pine. The machinery required is a saw for cutting the wood to proper lengths, a stave saw for sawing the staves, and two jointers to take care of the output of one stave machine.

Regarding the cost of operation, this firm states that a great deal depends upon the man who operates the stave saw. Some men will saw 6,000 staves per day, some 8,000 and some 10,000, the latter being practically the maximum figure. According to their experience, the cost of sawing and jointing staves is approximately $1.60 per thousand. This applies to normal conditions. At present, on account of the high wages paid to all classes of workmen, the cost would be increased to some extent.

The price of the finished product depends, like that of all other manufafctured goods, upon supply and demand. During 1916 and 1915 staves have been low in price. The apple crop has been less than average, and arrangements had been made for supplying a large demand from this source, the result being that there has been a surplus of stock until quite recently. This has now been practically cleaned up. The foreign demand has also been less than usual on account of the war and the disturbance of trades and industries using staves.

The situation in connection with the stave market in Nova Scotia is indicated by the fact that our informants have not been cutting staves for about a year, although they have three stave mills and had a contract for some 2,000,000 staves for the year 1914. Since that time they have been cutting only for the local demand for apple barrels. They report that according to their experience at the present time, no one can cut staves for less than $6 a thousand f.o.b., shipping point.

The freight rate situation has also been a serious difficulty in connection with the production of staves during the past two years. Freight rates have increased enormously in all directions, both by rail and water, and the cost of placing staves in the hands of the consumer is nearly double. This company nearly closed a contract for 6,000,000 staves, on a delivered price, to a southern port in the autumn of 1915. At that time they estimated that freights on lumber would probably advance during 1916 to $7.50 or possibly $8 per thousand, and they were figuring on this basis. Fortunately for themselves they became a little more cautious than usual and decided to quote only on an f.o.b. basis. The result was that they lost the business, which was really an advantage to them, for the freight rate on lumber to the same port increased to $16 per thousand during the same year.

In conclusion, this firm reports that unless the consumers of staves advance their ideas in regard to price materially, they will have to find some substitute, as no one can cut staves at the prices that have been ruling during the past year.

Another manufacturer in Nova Scotia reports that he uses fir, spruce and poplar, for apple and potato barrels. His machinery includes a stave saw, shingle machine which is used for both shingles and heads, head rounder, planer and stave jointer, and a cut off saw for sawing logs to the right length. One cord of wood makes from 1,000 to 1,200 staves, according to the quality. Five cords of wood will saw into 1,000 pairs of heads. Staves are selling in his locality at about $6 per thousand, heads at $60 per thousand pair, and hoops at about $6 per thousand. Staves are supposed to be sawed 14 to a barrel, coopers are charging 5c per piece for making. Milling ought to cost $1.25 per thousand for staves and $20 per thousand pairs for heads (not including wood). Barrels at this point are bringing 29c or 30c each. He reports also that a good stave sawyer ought to put out on an average 8,000 pieces per day.

Imports of Timber into Australia

According to a report from the Canadian Trade Commissioner at Melbourne, Australia, imports into the State of Victoria during the past three years have been as follows:

Timber.	1914. Super. feet.	1915. Super. feet.	1916. Super. feet.
Total importations	160,609,000	86,170,000	87,886,000
Total consumption	151,854,000	102,571,000	93,177,000
Total stocks held	76,913,000	60,512,000	55,221,000

The fluctuations in the quantities of each classification of timber imported into Melbourne during the fiscal years ended in 1914, 1915, and 1916 are illustrated in the appended schedule:

Class.	1914. Super. feet.	1915. Super. feet.	1916. Super. feet.
Red deals	4,778,000	909,000	2,320,000
Dressed flooring and lining	51,453,000	35,743,000	19,235,000
Spruce and hemlock	5,235,000	3,272,000	711,000
Oregon (Douglas fir)	50,406,000	17,973,000	22,378,000
Sugar and yellow pine	3,669,000	1,433,000	1,389,000
Redwood	13,727,000	10,478,000	11,773,000
Dressed American shelving	25,000	74,000	33,000
New Zealand kauri	4,096,000	3,275,000	4,255,000
New Zealand white pine and rimu	13,947,000	12,400,000	23,697,000
Clear pine	73,000	23,000	61,000
Pacific pine (Siberian)	13,200,000	590,000	2,034,000
Laths ....No.	30,796,000	10,630,000	11,630,000
Pickets ....No.	1,346,000	658,000	752,000

Timber Stocks Held in Melbourne at June 30, 1916.

A tabulated statement of the stocks of timber held in Melbourne at the close of each fiscal year from 1914 to 1916, inclusive, is submitted, thus:

Class.	1914. Super feet.	1915. Super. feet.	1916. Super. feet.
Red deals	3,583,000	1,863,000	2,786,000
Dressed floorings, linings, etc.	18,454,000	23,575,000	18,350,000
Spruce and hemlock	4,691,000	2,996,000	996,000
Oregon (Dougas fir)	21,464,000	9,688,000	6,650,000
Sugar and yellow pine	4,362,000	2,815,000	2,308,000
Redwood	6,169,000	4,420,000	7,226,000
Dressed American shelving	96,000	62,000	47,000
New Zealand kauri	5,009,000	5,249,000	5,521,000
New Zealand white pine and rimu	10,201,000	9,503,000	11,044,000
Clear pine	95,000	46,000	48,000
Pacific pine (Siberian)	2,780,000	295,000	245,000

Contraction in Imports of Timber Forecasted.

While the stocks held in Melbourne on June 30 last were not far short of the usual average, yet the sources of supplies were materially altered.

The inability to arrange charters from the Pacific Coast gave New Zealand timber mills an exceptional opportunity, of which full advantage was taken, to increase their exports to Australia—particularly in white pine and rimu.

With abnormal costs of all building materials, dearer money, and increased taxation, speculative building has ceased in Australia, and, on expert authority, the present outlook points to a marked contraction in importations of timber for some time to come.

The Serbian Timber Mills Near Melbourne.

Failure has followed the enterprise of the Australian capitalists who, a few years ago, constructed large timber mills, equipped with modern plant, near Melbourne, for cutting Siberian pine. The timber was imported in logs, then duty free (now subject to 5 per cent.), in comparison with the duty of 6 shillings per 100 superficial feet on dressed timber.

The logs were comparatively small, but, despite considerable waste in the cutting, the company expected to find a ready market for flooring, lining, and weather boards in competition with Baltic timber, which enters largely into the Victorian trade.

Increased oversea freights also contributed to the non-success of the mills, but it is now admitted that the chief cause of failure was that the first essential was the mills should have been erected alongside the forests.

The mills, which were closed some time ago, are now under offer to the State Government of Victoria for the purpose—after necessary alteration to the machinery—of cutting hardwoods on crown lands and in connection with the established state timber seasoning plant.

A second reading has been given to a bill introduced into the Quebec Legislative Assembly by Mr. R. Tourville (of the Tourville Lumber Mill Company) amending article 1627 of the Revised Statutes. This article, in its present form, provides that the holders of timber limits and all persons having timber to float may, during the winter, haul timber and provisions across the property of persons holding lands within their limits, provided that they shall be liable to indemnify the owners for any damage they may cause. The amending bill seeks to have the time limit changed from during the winter to all the year.

Is Forestry a Business Proposition?

An Outline of the Profits it Returns to the Government, the Public and the Lumberman—Market Extension Fire Protection, and Timber Estimating.

By M. A. Grainger*

I remember, when we started the Forest Service in British Columbia, many good people, and especially lumbermen and business men connected with the industry, shook their heads very doubtfully. "The logging and sawmill industries of the province are business propositions," they said; "commercial propositions, which can only be carried on by business men in a practical, business way." Well, that was five years ago, and since then we've carried on some forestry in British Columbia, and I think people generally have a better notion of what forestry is. I'll tell you some of the forms forestry has taken here.

Take selling lumber—that is forestry. Go through these enormous timberlands of ours and size up the situation. What do you find? You find this: Four-fifths of the annual growth, four-fifths of the annual forest income, that Nature asks us every year to turn into dollars, is wasted. We don't use it; we take out a mere thirty million dollars from the woods and leave the other four-fifths of one's lumbering prosperity behind. Why? Just because the markets for British Columbia lumber are insufficient. What's the remedy? Obviously bigger markets and more of them. Get these markets and this appalling waste of raw material will be stopped. Market extension means true forest conservation; and that's one reason why increasing the markets for British Columbia lumber is true forestry, and why the forest service carries on its market work, co-operating with our lumbermen in every way it can. You are familiar enough with the methods we employ—they are the usual publicity methods, advertisements in papers and periodicals, exhibits, and all that sort of thing. But the essential part of the work is its punch, and the punch is delivered by active, persistent, skilful, personal work by the man on the job.

It is not merely a question of finding new markets for British Columbia lumber to be sold in. It is a question of protecting the markets we already have. Where would the province be if any serious proportion of its existing lumber business were wiped out? It could not happen, you'll say; people have got to buy lumber; it is a staple article, like wheat. Well, they've been carrying on a searching investigation into the lumber trade of the United States, and this is what they've found as a result—just one-fifth of the entire lumber market that existed eight years ago has been wiped out; wiped out by substitutes—steel, concrete, bricks, patent roofing, asphalt paving; wiped out in some cases because the substitute was the better article, but in far too many cases simply because the makers of substitutes used modern selling methods and the lumbering industry did not. There's no better selling method than giving good service to the consumer; helping him to use your material and to get the best value out of it. That's the method we've adopted in this business forestry, or forestry business, of ours. Many a sale of British Columbia lumber has been made this year to prairie farmers who have been supplied by us with building plans and bills of material showing them how easily and well they can build barns or sheds or chicken houses with British Columbia lumber. And, just as we have done in this case, we hope to co-operate with our lumbermen and get all the best selling methods carried out in this community effort to increase the sale of British Columbia lumber.

In short, persistent market work, provided it has a punch in it, is one of the most practical methods of forest conservation. We're not the only pebble on the beach in this market work—our American friends are putting over some progressive ideas. For instance, in the interest of forestry they've allowed the export mills of the Pacific Coast to form a selling combine, the Sherman law notwithstanding, and they're sending five lumber commissioners to strengthen their grip upon European and other markets. It is interesting to note that these five are being selected from candidates who have been put first through a series of severe practical examinations, a new idea in foreign commercial service and a great change from the time-honored method of giving foreign commercial jobs to good Americans with a pull.

Forest Protection—A Publicity Problem.

Now, take another side of forestry—the protection of standing timber. Lots of people think this just means fighting forest fires, but that's not the point at all. Forest protection means two distinct things. Firstly, it means educating public opinion. Just as a breakfast food company keeps banging away with advertisements in newspapers, inside street cars, and on fences, until no conscientious family can sit down to an ordinary breakfast without a guilty feeling that they're neglecting their duty if they don't eat "Fruit Skins" or "popped wheat," or some other patent breakfast food. Just as public opinion is educated by the commercial advertiser so is it the business of the forester to educate public opinion to be careful with fire in the woods. People used to think it was a "josh" these scare-head posters on country roads, these articles in newspapers, these paper cups for campers with "Be careful with fire" stamped on them; these pocket whetstones we've given away to lumberjacks and pre-emptors and all sorts of men who work or camp in the woods. But this publicity campaign has proved itself; people are becoming more careful every year. We notice our fires are caught sooner and cost us less money on an average. The whole cost of all the publicity work responsible for this change has not amounted to the expenditure you may have to make in fighting a single serious fire.

Now this work of education is carried on to prevent fires from ever starting, as far as possible. The second part of forest protection is simply this: Good organization, supervision, the training of the man on the job to use good judgment in handling fires when they start. Good judgment is the one thing needed. There is no line of work in which it is so fatally easy to waste large sums of money as in fighting forest fires. It's emergency work; it needs cool judgment and experience. You can easily waste more money on some fire-fighting effort than what you save is worth. But mark one thing—you've got to realize what is worth saving. I remember an official report of an Eastern Canadian government once congratulated the country because the bad fires of the year had done no damage, "only young growth being destroyed," as the report said. Now, that's absurd. If you're going to adopt a general principle of letting the young growth burn, good night to the lumbering industry of British Columbia before this century is over. But let me repeat again—forestry means the putting of such matters as the fighting of forest fires on a business basis.

Estimating the Timber Resources.

Take another line—the stock-taking of forest resources. A fancy line, you'll say; sort of collecting data and masses of useless information and writing volumes of reports that no one reads. Now, we've done a little stock-taking in the last five years, but it's not of that description. It has been done mostly for the simplest, immediate business reasons. Our men have gone into various forest districts and roughly mapped out the places where the good timber is. We have not done it all over the province, for lack of men and time and money. But this rough mapping of valuable timber lands protects them from alienation, shows where timber sales can be made, and helps in the arranging of fire prevention work. It is a side of business forestry.

Now we come to forestry as a money-maker for the public treasury—something that makes your taxes far lighter than they'd be otherwise; one-third of every public dollar, two to two and a half million dollars of yearly revenue already and going to be a good deal more than that. That revenue has to be worked for; it won't keep coming of itself; and so forestry in British Columbia means an organized forest service with an annual turnover about equal to the three largest of our lumber manufacturing concerns combined. It means a considerable business in valuing and selling timber; it means inspecting logging operations to prevent trespass; it means making sure that cut timber pays the proper dues.

The tourist at a logging camp just sees a boom of logs. Our rangers see material that the crown is selling—something on which any one of twenty different sums of money should be collected. He has to see that these logs are clearly marked so as to show which of these twenty different amounts—ranging from 1c to two or three dollars a thousand feet—must be paid on these logs.

Where Posterity Comes In.

Now I've touched on four aspects of forestry in British Columbia—forestry as selling British Columbia lumber, forestry as forest protection, forestry as stock-taking of timber resources, and forestry as collecting money. Too utilitarian you may say. How about posterity? How about taking long views to safeguard the future? How about the development of a permanent forest policy? Do not mistake my meaning—these things must never be forgotten by any public service engaged in forest management. I have merely skipped over a few topics as an after-luncheon speaker should. Forestry, in the broad conception, is merely a great form of agriculture—the harvesting of Nature's successive timber crops—and we in the West, in our business of harvesting the present enormous crop, must not neglect to safeguard, in every practicable way we can, the next crop that is now growing.

And here's a point for you as business men: Trained men are needed in the work of forestry. What means of training does British Columbia provide? Do you know that almost every West-

* Address delivered before the Rotary Club of Victoria, B.C.

ern state deals with this question. Oregon has a forest school; California has a forest school; so have Washington, Idaho, Montana, and Colorado. Logging engineering is being taught as a profession, just like civil engineering is. Do you know that British Columbia provides no training whatever, though forest industries are our most important ones? Our young men must go and study at Seattle, or, if they have the money, they must go back east. With all its various professional equipment the University of British Columbia has no forest school.

And, again, the foreign buyer of British Columbia lumber, the city engineer back east, architects the world over, ask us, when we try to push the sale of British Columbia lumber: How strong is it What are its qualities? What engineering tests have been made of it? And we must answer: None—and lose the business. All we can do is to distribute hand-books for engineers published by our go-ahead American competitors—like the West Coast Lumbermen's Association at Seattle. It isn't good business when a firm has to send its competitor's price lists to its customers because it hasn't any of its own in print. But that is the fix we are in in selling British Columbia lumber. I think you will agree that we need a timber-testing laboratory at the provincial university.

Dominion Government Constructing Wooden Vessels

An order-in-council has been passed by the Dominion Government which will result in the development of closer trade relations between Eastern and Western Canada, by way of the water route through the Panama Canal, at the same time promoting trade between Canada and the West Indies. An immediate result will be the construction of two vessels of 2,500 tons register each, one at Vancouver and the other at Victoria, to participate in this trade. The vessels will be operated by the Department of Railways of the Dominion Government. They will be constructed of wood, and will have sails and auxiliary power, similar to those now under construction for the export lumber business, as provided for in legislation passed by the British Columbia Legislature last winter. It is expected that they will be the forerunners of much larger vessels to be placed by the Government on the same routes at a later date.

Plant of the Brown Corporation at La Tuque, P. Q.

The accompanying illustrations give one an excellent idea of the extent and layout of the plant of the Brown Corporation at La Tuque, P. Q. This company succeeded the original incorporators, the Quebec and St. Maurice Industrial Company. The mills are located at La Tuque, which is situated a little over one hundred miles north of Quebec city on the St. Maurice River, and has excellent water power facilities. La Tuque is located on the line of two railroads, the Canadian Northern and the Transcontinental. The Brown Corporation have splendid lumber manufacturing facilities, their sawmill and planing mill being of the latest and best construction. The product of these mills has a reputation second to none for being well manufactured and of good grade. The company are making a specialty of dressing lumber in transit and are giving very reasonable rates for dressing, resawing and ripping. In fact they are making a specialty at present of dressing and resawing in transit. In addition to their lumber manufacturing facilities the company are extensive manufacturers of sulphate kraft paper.

British Columbia Exporters Co-operating

Arrangements have been completed in Victoria, B.C., between all the exporting manufacturers of lumber in the province, with one exception, to pool their output for export purposes and have it handled by the Canadian Trading Company, which was incorporated for this purpose recently under British Columbia legislation. This company, through its connections in London and San Francisco, will be able to guarantee tonnage for lumber shipments within a very short time, and has also chartered all the vessels now being built in British Columbia yards for the lumber trade, with one exception.

Ottawa Foresters Hold Meeting

The first regular meeting of the Ottawa Foresters Club for the present season was held recently, the president, Mr. R. H. Campbell, director of forestry, occupying the chair. The chief event was an address by Mr. Roland D. Craig, of the forestry staff of the Commission of Conservation, who spoke in regard to the forests of British Columbia, illustrating his address with a number of magnificent photographs. An interesting discussion followed the address. Mr. Clyde Leavitt, forester for the Commission of Conservation, who recently attended the convention in Albany, N.Y., to discuss the best means of fighting the white pine blister rust, gave an account of the proceedings at that meeting.

Canadians Interested in U. S. Freight Rate Discussion

The Interstate Commerce Commission of the United States recently heard evidence in regard to the effect of the proposed increase in freight rates on lumber shipments over the Bangor and Aroostock, Maine Central, Canadian Pacific, and Canadian government railroads. New England lumber dealers claim that the rates proposed are higher than those in other sections of the conutry and would close them out of the New York market, and to some extent out of the Long Island Sound markets. A number of Canadian shippers also testified, stating that the advanced rates would enable them to do business in Southern New England, where competition had formerly kept them out of the market.

Catching Up to the Demand for Paper

According to the latest report of the News-Print Manufacturers' Association, stocks of news-print on hand at Canadian and United States mills showed a substantial increase during October, as compared with the preceding month, the figures showing an increase of about 1,800 tons, indicating that the mills were at least able to produce in excess of shipments, which is taken to mean that the climax of the unusually heavy demand that began in October, 1915, has been reached and a decline has commenced. The report states, also, that it is expected that from now on the mills will show a steadily increasing accumulation of stocks.

Pencils Made in Canada

The William Cane & Sons Company, Limited, of Newmarket, Ont., have been experimenting in the manufacture of lead pencils since the outbreak of the war, with a view of replacing German-made lead pencils by pencils made in Canada. They now announce that they are in a position to supply the Canadian market with pencils made in Canada.

Plant of the Brown Corporation at La Tuque, P.Q.

A Fine Example of British Columbia Timber

The accompanying illustration gives an interesting idea of the proportions and qualities of some of the timbers taken out in British Columbia. It shows the handling of a Douglas fir stick, logged and sawn on Vancouver Island, the dimensions of the stick being 24 in. x 24 in. x 80 ft. The illustration, unfortunately, does not show the whole stick, but gives some idea of the sizes procurable and the beautiful

A Douglas Fir Stick 24 in. x 24 in. x 80 ft.

quality of the wood. The stick shown in the foreground is not a single example. Others of similar size and quality are being taken out continually.

Dominion Fire Rangers' Annual Meeting

The annual meeting of the Dominion fire rangers was held at Revelstoke, B.C., recently. Reports were presented by all the rangers present, which showed that good results had been secured in the prevention of forest fires. A number of resolutions were adopted, among them being the following:

"That the provincial government be requested to extend the permit period for the season from September 15 to September 30."

"That the provincial government be requested in future when constructing new roads to dispose of the debris as they go along, instead of leaving it lying at the roadside, as it is a great fire danger."

Toys Made of Wood

The accompanying photograph gives an idea of what is being accomplished in Canada in the way of manufacturing wooden toys and novelties to replace the lines that were formerly imported from Germany. A study of this collection might offer suggestions from which other articles could be evolved. There are undoubtedly many articles that could be designed and worked out by studying the things that children are most interested in.

The toy set of furniture shown in the photograph and the small table, doll carriage, doll bed, etc., are good examples of the class of

Toys made of wood—A good market for for small cuttings.

toys required for girls, while the engine, building blocks, construction toy, gun, miniature wagons, etc., are articles that boys always clamor for. Then, again, there is the quoit game (the shield-shaped board with numbers on), swinging clubs, dumb bells, etc., for the older boys and girls.

There is plenty of scope for the man with an inventive mind to work out something that could be manufactured at a profit, but we would strongly advise anyone going into the manufacture of wooden toys and novelties to study the market carefully before going into it to any extent, as there are undoubtedly some toys on the market for which there is very little demand.

Wilfrid H. Pauze Conducting Successful Wholesale Trade at Montreal

In September last the firm of Pauze & Gohier, Cote des Neiges Road, Montreal, was dissolved, and the business taken over by Mr. Wilfrid H. Pauze, the partnership having lasted five years. Mr. Pauze, who has been in the lumber business eighteen years and was at one time a member of the Montreal City Council, specializes in British Columbia lumber products, particularly British Columbia fir, which has of late come into more extensive use in the East. His stock covers about $80,000 worth of materials, including an extensive variety of doors, mouldings, flooring, sheeting, verandah columns, turned posts, British Columbia red cedar shingles, and red cedar clap boards, in addition to Beaver boarding and Bishopric wall board. Besides this, various lines of lumber are stocked.

Mr. Pauze has excellent facilities for handling doors, mouldings, etc. The sheds cover an area of 2,000 feet, and the principal one of three storeys is probably the largest in Montreal. It is arranged so as to minimize handling, the stock being unloaded and loaded direct into C.P.R. cars, which come into the yard over an 800-foot siding, running alongside the sheds. The business is of a wholesale character.

An exhaustive catalogue in English and French is issued. Besides this, Mr. Pauze reaches the trade through samples of standard patterns of British Columbia mouldings, made up in sets of eight. Each sample is numbered, which facilitates the ordering of any line. The sets are put in such a form that they can be hung up in an office ready for immediate use.

Forester Receives Important Appointment

John D. Gilmour, formerly with the Forest Branch of the Department of Lands of British Columbia, has resigned in order to accept the position of general logging superintendent of the Anglo-Newfoundland Development Company, Ltd., a branch of the Harmsworth Company, owners and operators of immense pulpwood holdings in Newfoundland. Mr. Gilmour will assume his new duties during January, and will be stationed at Grand Falls, Newfoundland. Mr. Gilmour is a 1908 graduate of the Ontario Agricultural College and also of the Department of Forestry in the University of Toronto. He has had experience in the employ of private lumber companies and also in the Forest Branch of the Canadian Pacific Railway and the Forest Branch of the Department of the Interior at Ottawa. Since 1912 he has been on the staff of the Forest Branch of the Department of Lands of British Columbia, being district forester at Cranbrook from 1912 to 1915 and on the head office staff at Victoria during the past year.

Sees a Great Future for Western Canada Trade

Mr. Austin A. Briggs, advertising manager of the Dunlop Tire and Rubber Goods Company, Toronto, returned recently from a business trip through Canada, including a visit to Alaska. Speaking of his experience to a representative of the Canada Lumberman, Mr. Briggs said that, next to the kindness of the Western Canadians, the most outstanding impression upon his mind was made by the antiquated immigration regulations kept in force by the United States in Alaska. The same regulations that existed at the time of the gold rush in 1898 seemed to prevail still. Most of the people going to Alaska, Mr. Briggs said, were from the United States or from Western Canada, the majority of them being tourists. The best time for tourists to visit that country was in the month of June. Mr. Briggs visited a number of western points, and was greatly impressed with the immensity both of Canada's industrial progress and her possibilities. He also called upon the branches of his company at Victoria, Vancouver, Calgary, Edmonton, Saskatoon, and Regina, and toured the country in the vicinity of these branches in order to get a grasp of the opportunities for business in their particular lines. He has returned with a great fund of enthusiasm in regard to the outlook for the country's western organization and the prospects for greatly increased business.

Saskatchewan Output will be Large

Reports from Prince Albert, Sask., indicate that extensive woods operations will be carried on by the Prince Albert and Big River lumber companies during the coming winter, and that woodsmen are already going into the bush in considerable numbers. Altogether between four and five thousand men are needed by the two companies for this winter's operations, and the indications are that the supply of labor will be scarce.

CANADA

NATIONAL SERVICE

PUBLIC NOTICE is hereby given under the authority of the "War Measures Act, 1914," that during the first week in January, 1917, an inventory will be made by the Post Office Authorities, of every male between the ages of sixteen and sixty-five, residing in Canada.

National Service Cards and addressed envelopes for their return to Ottawa have been placed in the hands of all Postmasters for distribution amongst the persons required to fill in such cards. Every male person of the prescribed ages is required to fill in and return a card enclosed in an envelope within ten days of its receipt.

Any person who fails to receive a card and envelope may obtain the same upon application to the nearest Postmaster.

R. B. BENNETT,
Director General.

Ottawa, 15th December, 1916.

THE NATIONAL SERVICE CARD

1. What is your full name?..... 2. How old are you?.....years.

3. Where do you live? Province.....

4. Name of city, town, village or Post Office .....

Street..... Number.....

5. In what country were you born? - - .....

6. In what country was your father born? .....

7. In what country was your mother born? .....

8. Were you born a British subject?.....

9. If not, are you naturalized?.....

10. How much time have you lost in last 12 months from sickness? .....

11. Have you full use of your arms?.....

12. Of your legs?..... 13. Of your sight?.....

14. Of your hearing?.....

15. Which are you—married, single or a widower? - .....

16. How many persons besides yourself do you support? .....

17. What are you working at for a living?.....

18. Whom do you work for?.....

19. Have you a trade or profession?..... 20. If so, what?.....

21. Are you working now?..... 22. If not, why?.....

23. Would you be willing to change your present work for other necessary work at the same pay during the war?.....

24. Are you willing, if your railway fare is paid, to leave where you now live, and go to some other place in Canada to do such work?.....

GOD SAVE THE KING

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) ($2.10 per inch. each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

PULPWOOD WANTED

If you have pulpwood for sale in large or small quantities, send for our complete list of pulp and paper manufacturers. In the list you will, no doubt, get in touch with buyers for all the pulpwood you have or can supply. Complete list of all manufacturers and dealers sent for six dollars. Money refunded if not as represented. Get our prices on lists of wholesale and retail lumber yards. Reliable Trade Lists Company, at 641 Calvert Building, Baltimore, Maryland. 24-24

PULPWOOD FOR SALE

10,000 acres of choice pulpwood in Nova Scotia. Excellent shipping facilities. Will sell en bloc or would consider taking contract of ten or fifteen thousand cords of rossed wood, for shipment next year. This is a big opportunity for someone. The paper industry offers a great field, and it will be more important from now on. There is no finer tract than the one offered here, with transportation right at hand. Write for detailed information.

GRANT & CAMPBELL,
New Glasgow, N.S.

Valuable Box Factory For Sale

The undersigned will receive offers for the purchase of that valuable property known as the

Czerwinski Box Factory

situated on Logan Ave. and Tecumseh Street, Winnipeg, Canada. This property comprises what is believed to be the finest box factory in Western Canada, fully equipped with the latest and best machinery for box manufacturing and ready for immediate operation. It also includes the factory site, consisting of about 2½ acres of land close in to the business centre of the city, and possesses unexcelled trackage facilities. Street cars pass the factory door. This is a magnificent opportunity for any person wishing to engage in box manufacturing. The whole may be purchased at a very great bargain.

Further information may be obtained upon application to

H. E. DENEEN,
Assignee of the Czerwinski Box Co., Ltd.,
300 Electric Railway Chambers,
22-t.f. Winnipeg, Man.

FOR SALE TIMBER AND MILLS

The undersigned offer for sale in one or separate blocks their timber and mills situated on the Crow's Nest Pass Railway, B. C., viz:—

About 12 square miles near Cranbrook, B. C., well wooded with larch, fir, etc., and a mill in good working order, capacity forty thousand feet.

On Lamb Creek, near Moyie, B. C., 12 square miles, heavily wooded with white pine and large spruce.

At Yahk Station, 4,551 acres Crown granted timber land, also about 7 miles white pine, larch and spruce, and a mill with a capacity of sixty thousand feet.

At Cranbrook the company own an up-to-date plant equipped with good machinery, where, under a favorable arrangement with the C. P. R., the output from different points named can be assembled and dressed ready for shipment.

The above timber all being in close proximity to the C. P. R. and the distance to the Alberta boundary being about 100 miles, gives the producer an advantage over the Coast mills, saving from $2.00 to $5.00 per thousand feet in freight alone.

The King Lumber Mills, Limited,
23-2 Cranbrook, B.C.

For Sale—Controlling interest in a Saw and Planing Mill, capacity 25,000 feet. Could be increased considerably. Mill on rail and tide water. Unlimited timber supply. For particulars apply to R. H. Young, Squamish, B.C. 21-24

Miscellaneous

Sleighs For Sale

Twenty-five sets logging sleighs, in good condition. The Peterborough Lumber Company, Limited, Peterborough, Ont. 20-1

For Sale

One hundred square miles of Pine and Spruce limits well situated on the St. Maurice River, on which at least 400,000,000 feet of lumber will be found. Price $350,000, payable $150,000 cash and the balance in four annual payments, with interest at 6 per cent. For full particulars apply to La Cie des Bois du Nord, 71a St. James Street, Montreal 21-24

B. C. Timber Limits

The brisk demand for lumber in the Western Canadian Prairie Provinces is attracting attention to timber limits. The closing of the war will largely increase the local and export lumber requirements. We have some meritorious propositions of varying proportions (which can be bought advantageously) and solicit correspondence from partctical parties.

LOUGHEED & TAYLOR, LTD.,
24-24 Calgary, Canada.

Separate Sealed Tenders, addressed to the undersigned, and endorsed "Tender for British Columbia Fir Timber" and "Tender for White Oak Timber" for Dredge "No. 125," as the case may be, will be received at this office until 4 o'clock p.m., on Friday, December 22, 1916, for the supply of Timber for Dredge No. 125.

Combined specifications and form of tender can be obtained at this Department, at the offices of the District Engineers, Shaughnessy Building, Montreal, Que., and Equity Building, Toronto, Ont., also from the Mechanical Superintendent, Birks Building, Ottawa, Ont.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent. (10 p.c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the contract. If the tender be not accepted the cheque will be returned. The Department does not bind itself to accept the lowest or any tender.

By order,

R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, December 1, 1916.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department. 24-24

Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines for Ontario, has announced that the Pic River pulp and timber limit recently offered for sale by his department has been disposed of to J. J. Carrick, former Conservative member of the Legislature, and now member of the Dominion Parliament.

TIMBER ESTIMATES

Appraisal of timber lands, timber maps, logging efficiency reports, planting. Maximum of accuracy in minimum time and at minimum expense.

D. E. LAUDERBURN, Forest Engineer

Rm. 1233, 156 Fifth Ave., New York, N. Y.

Tenders for Pulpwood and Pine Limit

Tenders will be received by the undersigned up to and including the 1st day of February, 1917, for the right to cut pulpwood and pine timber on a certain area situated on the Black Sturgeon River and other territory adjacent thereto, in the District of Thunder Bay.

Tenderers shall state the amount per cord on pulpwood, and per thousand feet board measure, on pine, that they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, and $2.00 per thousand feet, board measure, for pine, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque, payable to the Honourable the Treasurer of the Province of Ontario, for ten thousand dollars ($10,000), which amount will be forfeited in the event of their not entering into agreement to carry out conditions, etc. The said $10,000 will be applied on account of bonus dues as they accrue, but the regulation dues, as mentioned above, will require to be paid in the usual manner as returns of cutting of wood and timber are received.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

G. H. FERGUSON,
Minister of Lands, Forests and Mines.

Toronto, 1916.

Review of Current Trade Conditions

Ontario.

The chief subject of discussion among the lumber trade of Ontario continues to be the situation in connection with logging operations during the winter. Unquestionably there will be a greatly reduced output of logs, and the cost of taking them out will be far in excess of anything ever experienced in previous years. When these logs reach the mills next spring they will be few in number and high in cost, and the mills themselves will undoubtedly be facing a serious shortage of labor, so that the manufacturing costs will be increased to a greater extent even than the cost of logs. There is only one way out of such a situation for the manufacturer. Prices will have to be increased next year. The extent of the increase cannot be determined until fairly complete returns have been secured of the winter's operations, and some insight is had into the labor situation that is to prevail next year. Moreover, the outlook at present is that there will be a normal demand for lumber next year, and this will be an added influence in the direction of stiffening up prices.

The quantity of hemlock taken out of the woods during this winter will probably amount to only about 40 per cent. of that which came out last winter. A curtailment is also certain in the output of red pine. Last year the red pine output was almost 40 per cent. below that of 1915, so that a decrease this year will have a most important effect upon the trade situation in this particular line of lumber. Quite a number of important white pine manufacturers are not taking out any logs this winter, and those who are operating are finding it very difficult to obtain sufficient labor. Some operators are remaining out of the woods because of the high cost of logging, while others are doing so because of the probability that, even if they got a fair supply of logs at a reasonable cost, the expense of sawing them into lumber next year may be too great to warrant any mill operations.

There is nothing to report in connection with the trade situation beyond the fact that prices continue to stiffen, as will be seen by consulting our quotations elsewhere in this issue. The extraordinary demand for lumber as material for war purposes has resulted in the low grades being practically all shipped out from the mills, while the upper grades have been meeting with a fairly satisfactory demand of a normal nature. There is very little spruce of any kind to be obtained in Ontario to-day.

Eastern Canada.

The lumber trade at Montreal shows no important change, being still in a fairly satisfactory condition for this time of year. The large amount of shell box orders continues to assist in the movement of stocks. Enquiries are quite plentiful, the real difficulty being that of obtaining stocks of dry lumber. Many manufacturers report that they have nothing on hand to sell. The situation is such that wholesalers are predicting further advances in prices of pine and spruce, to the extent of from $1 to $3 per thousand feet. There is a fair volume of building demand, and the outlook in this connection is improving. The export season has come to an end, and shows an increase in the total of shipments from Montreal during the year 1916, which is considered satisfactory in view of all the difficulties the trade has had to meet.

Abnormal conditions continue to prevail in the St. John market. The price of deals is far beyond anything ever experienced, but as there are practically no stocks left for sale, the manufacturers are not much interested in the situation. A few manufacturers who have small stocks for spot delivery are getting as high as $25 per M. feet for deals of the poorest specifications. This is a situation which is not expected to keep up indefinitely, but probably will last for some time yet. The French and English Governments have purchased large quantities of deals for trench work, and extensive shipments are now going forward from St. John. Even if the manufacturer were selling much stock at these prices he would not be making a great profit to-day, as logging costs are so excessive. It looks as though practically all the St. John mills will be closed down shortly. Logging operations have not been very successful up to date, on account of the unfavorable weather for yarding. The local trade at St. John is fairly active, but not much is looked for during the winter months. Stocks of merchantable spruce boards are light and prices have advanced. Shingles are scarce at St. John, and are likely to continue throughout the winter. The box business is very brisk.

Boston wholesalers are not experiencing any difficulty in maintaining quotations on a firm basis. The base price for 8 in. frames is strong at $30, and $31 is asked for 9 in., $32 for 10 in., $33 for 11 in. or 12 in. frames. Even on this basis sellers will not promise delivery in less than a month. Stocks of random are also light, and quotations are firm on the following basis: 2 x 3, $24; 2 x 4, $25; 2 x 6 and 2 x 7, $24; 2 x 8, $28; 2 x 9, $29, and 2 x 12, $30. Stocks of 2 x 8 are very scarce, and $29 has been paid for prompt deliveries. Spruce boards are firm, and good covering boards, 5 in. and up wide, 8 ft. and up long, bring $22. The hardwood market at Boston is firm, and prices include the following for 1 in. first and seconds: Basswood, $44 to $46; maple, $42 to $45; red birch, $57 to $59; sap birch, $47 to $49. Hemlock is also in good demand at Boston, plenty of sales of clipped hemlock boards being reported at $22. The railroad situation has greatly reduced competition from Southern roofers. Shingles also are firm at Boston, and retailers are having difficulty in securing supplies. The lowest price for extra white cedars is $3.60. The range on white clears is $3.30 to $3.50, but some manufacturers are asking more. New Brunswick manufacturers are having difficulty in getting cars to make delivery. The lath market at Boston continues active and strong. Some sellers are now asking $4.65 for 1⅝ in. For 1½ in. the market is firm at $3.90.

United States.

The car shortage in the United States appears to be just as acute still as it has been since the beginning of autumn. Shipments of lumber designated for government use and materials that are to be used by the railroads themselves are being moved regularly, but all other stocks are being delayed. Railroad companies are buying large quantities of cars and increasing their rolling stock as rapidly as possible. They have never before been required to handle such enormous traffic as during recent months. Business conditions throughout the United States continue favorable, so far as producers and dealers are concerned, though the consumer is having a pretty bad time of it, as prices are advancing constantly in practically every line. Even lumber has begun to take a share in the increase. Building operations are still extensive in all parts of the country, the winter season not having had any effect as yet in the way of reducing the volume of building operations. Cotton producers in the South are enjoying great prosperity, and the lumber trade is feeling the benefits of this situation.

Manufacturers in Pacific coast states are feeling the car shortage seriously. Reports from 130 mills show unshipped orders on hand for rail delivery of 10,779 carloads of lumber. Shingle mills are also experiencing great difficulty in making shipment. Pacific Northwest mills are operating at less than normal capacity, production for the latest week under report being 14.72 per cent. below normal, while orders were 2.61 per cent. in excess of production. Extensive shipments are reported from Bellingham, Wash., to Australia. A number of Southern pine mills which recently withdrew from the markeet have succeeded in shipping out all the business they had on hand, and are expecting new business at the advanced prices which recently came into effect. Southern pine manufacturers in general are now securing much more satisfactory prices than previous to the development of the car shortage.

The hardwood situation is similar in many respects to that in the soft woods. The demand is quite up to normal, and is steadily increasing, while buyers are urging manufacturers for prompt deliveries. Northern hardwoods are all in strong demand, and prices are being advanced. Stocks of birch, maple, and basswood are low, and the demand is exceptionally strong, so that buyers are finding it hard to fill their requirements, particularly for thick stock. Hemlock manufacturers are enjoying splendid trade, and stocks at mill points have been greatly decreased. A very satisfactory volume of trade is reported in Northern white pine, but difficulty continues in regard to obtaining shipments, on account of car shortage and the inability of manufacturers to supply the demand for uppers and thick stocks as fast as required. Price advances have been reported on white pine.

Great Britain.

The trade situation in Great Britain shows no change of late, and this is a satisfactory report to be able to make, both from buyers' and sellers' points of view. Although prices are pretty dear for the buyers, they are making good profits, and as to sellers, they are expecting still higher prices in 1917. It is generally concluded that contracts at current c.i.f. prices are good business. The demand is well sustained. Stocks in shape for immediate delivery are moderate, and are bringing good profits to their owners. A continuation of present conditions must involve a steady advance in prices in Great Britain. Spot prices are now very firm, and no one seems to imagine that they are likely to fall for some time to come. From the merchant's point of view, the market is established for the winter, although some are looking for further considerable advances.

At Liverpool there is a general belief on the part of merchants that present-day values for both hard woods and soft woods are not

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

anything like as high as they may ultimately become as a result of shortage of shipping accommodation and other important factors. In the near future they are looking for another upward tendency. The actual consumption of timber is much smaller than it was some months ago, but importations have been restricted abnormally, and trade has suffered by the migration of labor to other lines. Sales of timber have been growing smaller, but stocks are now depleted to a serious extent, and arrivals are even smaller in proportion. Stocks of spruce at Liverpool are considerable, but much of this has already been sold, and prices are advancing. Recent quotations for scantlings were about £26. Quotations for 3 x 7 in. were £27 10s.; 3 x 9 in., £29; and 3 x 11 in., £35.

At Manchester trade continues good, both as to the volume of orders and of enquiries. Firm prices still prevail, and as comparatively little timber will come forward during the balance of the year, the outlook is for much higher values. Large orders have recently been placed by the government for timber for huts and shell boxes. Freight rates are still advancing, and very little tonnage is offering. Spruce prices are well maintained. Stocks of prime lumber are limited, and there is not much coming forward. The hardwood trade at Manchester is steady, and prices are very firm, with a moderate demand. Imports are practically nil, on account of government restrictions. It is reported that the import prohibition orders will shortly be enforced even more strictly.

At Glasgow there is a very firm market for Quebec oak and elm logs, and prices quoted for suitable sizes are very high. Most of the current business in pine and spruce deals is from the ship's side, and prices have been firm, but no important advance is reported.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Montreal Trade Continues on Sound Basis

Montreal, December 12.—(Special to the Canada Lumberman.)—There is little change in the situation, the market being still in a satisfactory condition, having regard to the time of the year. Were it not for the demand for shell box orders the position would not be anything like as good as it is. Wholesalers do not complain of the lack of enquiries, but of the great difficulty of obtaining dry lumber. Manufacturers in many instances say they have nothing to sell so far as dry stock is concerned, or that lists are withdrawn and quotations can only be secured on enquiry. Wholesalers state that prices are advancing, and they will have to pay at the least from one to three dollars more for pine and spruce, while some manufacturers are by no means in a hurry to sell the new cut, believing that the market will go still higher next year.

Several building contracts have just been let, and the demand from this source is fair. The erection of a large munitions plant in the east end of the city resulted in some excellent orders. There appears to be a decidedly more optimistic feeling as to the building outlook. The number of empty houses has decreased, and more capital is being invested in buildings, although some of these are necessitated by war requirements. The recent revival is shown by the building permits of last month, which are valued at $865,530, against $435,745 in November of 1915.

The export season closed the first week in this month, when the shippers rushed all that was possible to be taken. As a whole, the year has been better than was at first expected, and tonnage, although scarce, was more plentiful than first anticipations foreshadowed. The falling off in British requirements checked exports during part of the season, some firms declining to ship with freights at such high figures and markets uncertain. The situation so far as space is concerned was relieved somewhat by the engagement of tramps, which loaded here and also at lower ports. Freights were as high as 400s. per standard, but they had a smart decline, falling 90s. in the course of a week. This rather upset calculations, and for a time little lumber was sent forward, exporters not caring to take chances on a falling market and being in the dark as to how far the decline would go. They naturally desired to get the best rates, and held their hands until the market was on a more stable basis. The lowest point touched was 200s. per standard, and the latest quotations were around 300s.

Montreal Exports During 1916

Montreal, December 7.—(Special to the Canada Lumberman.)—Following are the figures of exports from the port of Montreal to the United Kingdom and the European Continent during the season which has just closed. This is not a complete statement, as the statistics for railway, steamship lines, and small shippers have yet to come:

	1916. Ft. B. M.	1915. Ft. B. M.
Watson & Todd, Ltd.	25,131,362	23,445,439
W. & J. Sharples, Regd.	14,039,035	9,847,219
E. M. Nicholson	13,035,542	15,239,280
Cox, Long & Co.	9,814,594	5,130,576
R. Cox & Co.	8,125,121	8,852,632
J. Burstall & Co.	7,667,826	7,762,353
Bennett Lumber Company	6,908,157	11,000,000
E. H. Lemay	4,998,003	7,000,000
Dobell, Beckett & Co.	4,854,406	4,446,160
	94,574,046	92,723,659

The total is very satisfactory, having regard to the difficulties caused by the lack of tonnage and the very high rates of freight. Shippers often found that space on which they had counted was at the last moment commandeered by the government, which held first place for supplies, etc. Markets on the other side were good for a considerable part of the season, although towards the end prices were not encouraging, and some exports were stayed on this account. The total of 94,574,046 feet compares with one of 92,723,659 feet in 1915, an increase of 1,850,387 feet, and with 62,283,783 feet in 1914, which was an exceptionally poor year.

It will be noticed that, as usual, Watson & Todd, Ltd., head the list, and have increased their shipments, notwithstanding that pine was not a very brisk market in the United Kingdom, and W. & J. Sharples are in second position, displacing Mr. E. M. Nicholson, whose exports in 1915 were unusually large owing to the heavy requirements for birch. This season birch and other hardwoods could only be imported into Great Britain under Board of Trade license, and this no doubt had a tendency to check the shipments. The Bennett Lumber Company have fallen off very considerably, while Cox, Long & Co., who in 1914 did not export half a million feet, have neearly doubled their total of 1915, and just fall short of ten millions.

St. John Markets Quite Abnormal

St. John, N.B., December 7.—(Special to the Canada Lumberman.)—The St. John market is in the most abnormal state on record. Prices for deals are beyond anything before experienced, but practically no stocks are left for sale. So the situation means very little to the mill man who disposed of his goods a year ago. Millers who have goods for spot delivery are getting unheard-of prices, $25 per M. feet being a very reasonable price for deals of the poorest specifications. This, of course, is not expected to keep up, but no doubt a good market will be had for a considerable time. Large quantities of deals have been purchased by both the French and English Governments for trench work, and are now going forward from St. John, N.B., in large quantities; but, even though these prices are being paid for spot deliveries, it leaves the miller in a very poor position. The man who has logs to sell thinks that this will keep on forever, as does also the laboring man, both of whom are selling their products at high prices. If anything should happen—and no doubt it will—to lessen the prices for lumber, the mill man must be the loser, as he will have to pay all these increased costs, and is taking a long chance on the market. Labor at St. John is very scarce, the men having gone to the winter port work, forcing all the mills excepting one or two into idleness. It will be only a few weeks until the other mills also will be silent. It is very hard upon the manufacturer, whose season is very short at the best, to be forced to close up his mill at least a month earlier than usual. The American market also remains very firm, showing no signs of weakening at the present moment. The base price in New England has reached $30 per M. feet. The New York market also is firm, but there is very little, if any, lumber to go to this market from St. John. Freights are higher than early in the season, liners being now quoted at around 300 shillings, against 210 shillings early in the season. Many firms are making large commissions on the freights secured early.

The getting of logs is progressing very slowly as the weather up to date has been very much against it, being unfavorable for yarding. The woods have been wet, and any swampy country has not been get-at-able at all. Logs are surely going to cost the operators a good price. If anything happens to the operator's market he will lose very heavily.

Locally business in the factories and lumber yards has been fair, but now shows signs of slackening, and no building of any conse-

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

quence will be undertaken this year. The winter months will probably be extremely dull.

Stocks of merchantable spruce boards are very limited, indeed, and prices have also advanced.

Shingles are also scarce at St. John, and will continue so this winter, as the mills are practically all cleaned up.

The box business is brisk. There is only one box mill here, but it is very busy.

The Corbet Automatic Steam Towing Winch

The accompanying illustration represents the Corbet automatic steam towing winch, manufactured by the Corbet Foundry and Machine Company, Ltd., Owen Sound, Ont. There are many features in connection with this winch that commend it for the use of all who make use of towing apparatus. In the first place, it permits the use of steel flexible cable, instead of the old-fashioned Manilla rope. All marine men will appreciate the importance of this feature, knowing that when using Manilla tow lines they have to purchase a new one every year, whereas the steel cable will last at least fifteen years. They will thus be able to save in a short time sufficient to pay for one of these steam towing winches.

In the second place, a substantial saving is effected in the labor cost. The use of the Corbet steam towing winch does away with the assistance of one or two men on each tug, thus cutting the cost of operation considerably. In addition to these features it is important to note that the steam towing winch is a great time saver in the operation of the tug, as a raft or scow can be brought close to the tug while the latter is under way. Another important feature is the addition of a spool, which can be operated independently from the drum by means of a friction between the gear and drum, thus permitting the machine to serve two purposes at one time. The winch shown in the illustration accommodates 1,050 feet of 1-foot hawser, or 950 feet of 1 1/16-foot hawser, which passes through the automatic hawser leader.

Corbet Automatic Steam Towing Winch

The leader travels to and fro across the front of the machine, thus preventing the hawser from climbing on top of itself on the drum and permitting the hawser to be drawn in when the tug is at any angle with the article it has in tow.

The machine is operated by one lever, which starts, stops, and reverses, only one man being required to operate it. These machines are now installed on some of the best tugs on the lakes, and have already had thorough testing. Those who are using them have sent in enthusiastic letters of recommendation.

The bed of the winch shown in the illustration occupies a deck space of 5 ft. 3 in. x 5 ft. 3 in. The engine is made up of two 8 in. x 8 in. cylinders, which operate the drum and spool by a pinion 10 in. in diameter on the crank shaft and a gear 42 in. diameter x 4 in. face on the drum shaft, thus giving the machine abundance of power.

This description of the machine will show tug owners that it is a very valuable piece of equipment for their work. The machine is made in four sizes, each size accommodating two sizes of hawser, viz.:

		Deck space required.
No. 1 machine will accommodate	1,200 ft. ¾ in. hawser	4 sq. ft.
	1,000 ft. ⅞ in. hawser	
No. 2 marchine will accommodate	1,050 ft. 1 in. hawser	5 sq. ft.
	950 ft. 1 1/16 in. hawser	
No. 3 machine will accommodate	1,500 ft. 1⅛ in. hawser	6 sq ft.
	1,350 ft. 1¼ in. hawser	
No. 4 machine will accommodate	1,600 ft. 1⅜ in hawser	7 sq. ft.
	1,400 ft. 1½ in. hawser	

The engines in Nos. 1, 3, and 4 sizes are placed outside of the frames, so as to permit the machine to be built more compact and lower, thus preventing the tug from being tipped when pulling at right angles with the tow.

Two wealthy young students at Yale University who disappeared on November 4th were recently located working in a lumber camp near Prince Albert, Sask. The fathers immediately left for the woods to bring their boys home.

Cost of Production Always Ahead

Northern Hemlock and Hardwood Manufacturers Find Selling Price Still Behind the Cost

At the regular fall meeting of the Northern Hemlock and Hardwood Manufacturers' Association an address was delivered by Mr. E. A. Hamar, who discussed the increased cost of logging and manufacturing in the following manner:—

We all remember last year's heavy losses with chagrin, and we are not looking forward to a repetition of that disastrous experience with any degree of pleasure. Why did we operate at all during that year? I remember talking to a manufacturer in another line at that time who seemed to be very much surprised to think we would continue to manufacture at a loss. He asked: "Why don't you shut down?" That is the rub, why don't we shut down when our figures indicate red and are on the wrong side of the balance sheet?

The whole trouble with us is, that we do our figuring afterwards instead of before. We are optimists and not opportunists. I think this is the history of the industry, and therein lies one of its greatest weaknesses.

There are a great many ways of figuring the cost of lumber, and perhaps most of them are right; but we cannot get away from the fact that it consists primarily of cost of stumpage, carrying charges, logging, freights, mill operating costs and administration expenses. On a basis of $2.50 to $3.00 for stumpage I dare say that nearly all of our members lost money last year and very few are making any this year; (I am speaking now and this discussion deals only with those members manufacturing largely hemlock and the lower priced hardwoods, for there are a number of plants still cutting a large amount of pine and high-priced hardwoods to which these figures would not apply. Conditions have been materially improved this year through foreign intervention. Lumber, however, has been a laggard; so that we have not been as fortunate as the other fellows; especially those manufacturing iron, copper and brass goods. These manufacturers and others have had very handsome advances; while on the other hand, owing to the very same causes, lumber continued down the toboggan well into the last half of the past year, since which time we have had a gradual increase in prices. This increase was forced by conditions over which we had no control, until at the present time we have an advance of about 15 per cent. Compare this with an increase of 10 to 20 per cent. in wages and an increase in mill and camp supplies, with the possible exception of hay, of 20 to 100 per cent.

For the sake of arriving at something concrete let us assume that we lost $1.00 per thousand last year (I know, of course, none of you will admit to losing that much), add to this loss $1.00 per thousand increase in logging and 60 cents increase in operation at the plant, we show that an increase of $2.60 in price is necessary to let us out even. We have no more than had this advance. Or putting it another way, we might summarize as follows:

Stumpage	$2.25
Logging	5.50
Freight	1.50
Sawing and shipping	3.80
Selling	.70
Administration	2.00
Cost of lumber on cars	$15.80

Our present selling price of hemlock at $1.50 to $2.00 off list prices is netting us about an average of $15.25 to $15.50 for all grades, No. 3 and better or for the product of the log; and maple is not doing much better. It would appear from figures submitted that it is going to keep us hustling to produce lumber the coming year at our present selling price. In my judgment prevailing prices are $2.00 a thousand too low. The market warrants an advance, and we are going to get the advance, for we must have it.

There seems to be one thing peculiar to the hemlock business, and that is, that the cost of production keeps up with, and about two jumps ahead of the selling price. Away back in the 90s we were selling for $9.50 and producing for about the same figure; in 1903 and 1904 we were up to $12.50 and the cost of production was still playing tag. In 1917 it will cost us $15.50 to $16.00 to produce; I am not wise enough, howeer, to guess at the selling price. Will it take a lumber famine to put prices where they belong, and are we to have a lumber famine? The only reason we have not an over-production right now is owing to the shortage of labor and that shortage is going to continue and become more acute. Therefore, the cost of all commodities will advance. Will lumber?

With a history of twenty years back of us, can we not see that the cost of production is going to keep up with, and just a little ahead of the selling price? Shall we strain every nerve to get a large stock of high-priced logs to sell at no profit, or shall we go slow and produce a normal or below normal cut and sell at profitable prices?

Sanitation and First Aid in Camps

Description of Plan Followed and Benefits Resulting from Systematic Methods in a Southern Camp.

An interesting address upon the results of two years' sanitation and first aid in logging operations was delivered at the recent Southern Logging Association meeting at New Orleans, La., by Dr. C. L. Vines, physician of the Crossett Lumber Company, Crossett, Ark. Although the logging operations in the South are different in many respects from those in Canada, there are a number of problems relating to the health of employees which are common to both countries, and for this reason we believe that many of our readers will be interested in Dr. Vine's address, which was in part as follows:

The problem of maintaining a constant and dependable supply of material to a modern sawmill depends as much upon the maintenance of a body of men and animals in their maximum of efficiency as upon access to suitable timber and means for its transportation.

Experience has shown that to maintain an effective personnel in camps the same careful attention is required as in permanent towns, and good results will only be obtained when the former makeshifts of medicine, surgery, and preventive medicine will have been supplanted by modern methods. The establishment of camps in remote regions, away from the facilities of community life, has caused the development of highly efficient systems of camp sanitation, which, together with a routine method of caring for injuries to minimize risk of untoward results, has made logging possible where formerly, because of insalubrious conditions, it could not have been attempted.

The adoption of routine sanitary and preventive measures has given such brilliant results in the two camps of the Crossett Lumber Company that, as the title of this paper states, a description of the work done and the results obtained in a short time should prove a matter of interest for those in charge of logging under similar conditions. The two camps of the Crossett Lumber Company supply the mills at Crossett, Ark., with all their timber, and are located in the lowlands of Southern Arkansas and Northern Louisiana, an average distance of eight and twenty miles south of Crossett; the camps are named Toler's and Duncan's, after the foremen in charge, and here are maintained the woods crews and their families. The nearer camp—Toler's—was established four years ago, and is located on somewhat rolling ground in a clearing of pine woods; drainage is excellent, the off-flow being to the south and west, through two natural stream lines. The lower camp—Duncan's—was built one year ago, and is situated on flat prairie land adjoining the woods; drainage of the camp site here has been effected through the digging of ditches, which connect into a common drain along the main line of the railroad, by which surface waters are carried well away from the camp. Each camp accommodates about 115 families, or about a total of 900 in both, white and colored in approximately the same numbers, of whom some 230 constitute the woods crews. All of the houses in both camps are transportable, each room constituting a unit, which can be disconnected and loaded on flat cars for moving. On installation the number of rooms required are simply put together, the junction being effected through accurately fitted doors. As now installed, the completed houses consist of one, three, or five rooms, depending upon the space required by the size of the families. All houses are electrically lighted, the current being generated in each camp by steam power, from which the street lights of the camp are also supplied. The water supply of both camps is derived from driven wells, 112 feet in depth at Toler's and 90 at Duncan's, the water being pumped into overhead pressure tanks, from which it is piped to all houses. The water at both camps has been bacteriologically and chemically examined, and has been found to be of an excellent quality. The water discharged from the houses is collected in small ditches and quickly carried off. There is no standing water or natural collections of water about either camp.

Closets are of the dry earth system, and are systematically inspected and given attention; the contents are removed twice a week during the summer season and lime applied; once a week during the winter, by a scavenger, who hauls the material to points well beyond the camps, where it is buried. The closets are limed during the week by the householders. The public closets in both camps receive the same treatment.

Garbage and household refuse are collected in closed galvanized iron cans, from which the contents are removed once a week by the scavenger. There is a small barn in each camp for the accommodation of a few animals. The barns are cleaned daily, the manure being hauled by the scavenger and buried.

One of the most effective measures with reference to the prevention of illness and injury has been the broad use to which the Y.M.C.A. organizations at both camps have been put. In accordance with the principles of these institutions, their educational effectiveness has been directed towards instruction of all of the people in the principles of disease prevention. Illustrated lectures, demonstrations, and moving pictures of sanitary and first aid methods are given at frequent intervals, and have proven very popular. An annual course in first aid relief is given by the writer to all foremen, upon the satisfactory completion of which a certificate of proficiency is issued by the staff of the Crossett Hospital. This course is given one night a week at the Y.M.C.A. building in each camp for four months, making a total of about fifteen lessons, during which the subjects of germs and infection, wounds, fractures and dislocations, burns and scalds, the use of stimulants, sunstroke are discussed. At the same time demonstrations and practice in the methods for control of hemorrhage, the application of bandages and splints, and the carrying of the injured are conducted. The course as outlined is then supplemented by lectures on accident and disease prevention, ptomaines and ptomaine poisoning, insects dangerous to health, and reptiles, with appropriate moving picture and lantern slide demonstrations at frequent intervals.

Application of First Aid.

As used in practice in the woods, the application of first-aid methods is thus always performed by some qualified individual on whose presence of mind and ability dependence can be put. The foreman in charge acts as captain of the first-aid emergency team and has access at all times to the first-aid appliances. These consist of first-aid boxes measuring about eleven inches in length, five in width and four in depth, and contain sterile dressings, tincture of iodine, liquid petroleum, safety pins, and stimulants. Stretchers are carried on all trains, and in cases of serious accident patients are transferred without delay to the general hospital at Crossett. In every case of accident a written report is made out by the foreman and transmitted to the physician, who records all treatment and later notifies the foreman when the patient is able to return to his work. Each foreman also makes out a monthly report to the hospital of every injury sustained by his men, with the result that a certain pride is taken in keeping the casualty list as small as possible among the different crews employed. As a further means of keeping the necessity of prevention of disease and injury constantly in the minds of the men, bulletins relative to "Safety First" matters, avoidance of carelessness and accidents, and disease prevention are displayed in conspicuous places in the Y.M.C.A. buildings, on the trains, and in the stores.

Results of First Aid.

Reference has been made to some of the results that have followed the introduction of sanitary measures throughout the camps, and there remains for discussion the marked diminution in all illness, more especially illness of the usual camp type, and infection following injury. The immediate application of tincture of iodine, followed by a sterile dressing, has resulted in an early return to their work of men who otherwise would have been incapacitated for lengthy periods by infections, and in addition has frequently been all of the treatment needed in many of the minor injuries that formerly required continued attention. It may be added that this single measure of first aid for wounds is the method in use on the battlefields of Europe before patients can be transferred to hospital.

The very practical and material gains that have followed in the wake of the work done in the camps of the Crossett Lumber Company and in the way of instruction to their personnel are represented by an increase in the efficiency of crews, as shown by the performance of the same work as formerly in less time; infinitely more healthful conditions about the homes and a knowledge of disease and accident prevention has rendered the men more self- reliant and capable of greater earnings. The mental strain incident to loss of rest because of illness in some member of the family has also given way to repose, and full application of energy to the work in hand.

An advantage accruing to the physician in charge of which mention must be made is the gain in time through lessening the daily sick call and dispensing of medicine, whereby he may better apply himself to his first duty—that of prevention of disability and maintaining the efficiency of those under his care.

We have always received hearty and active co-operation from the superintendent and foremen in charge, and from the people themselves, without which the results obtained would not have been possible. The same spirit of enterprise, together with the intelligent application of similar measures as outlined in this paper can be made to be productive of equally beneficial economic results in practically all camps, and the knowledge that better and greater things can be accomplished by individuals living under conditions of increased expectancy of life and health should stimulate extension of the work of disease prevention universally.

Quebec Culler's Report

The following comparative statement of timber, measured and culled to date, is furnished by the Quebec Supervisor of Cullers' Office, under date of December 6th:

	1914—Cu. ft.	1915—Cu. ft.	1916—Cu. ft.
Waney white pine	593,080	401,680	148,760
Red pine	1,040	.....	.....
Oak	343,240	119,440	342,480
Elm	305,240	46,840	72,160
Ash	680	840	1,680
Butternut	.....	.....	40
Birch and maple	50,800	48,880	46,880

McLennan's Lath Mill and Bolter

Utilize your unsaleable lumber with a lath mill.

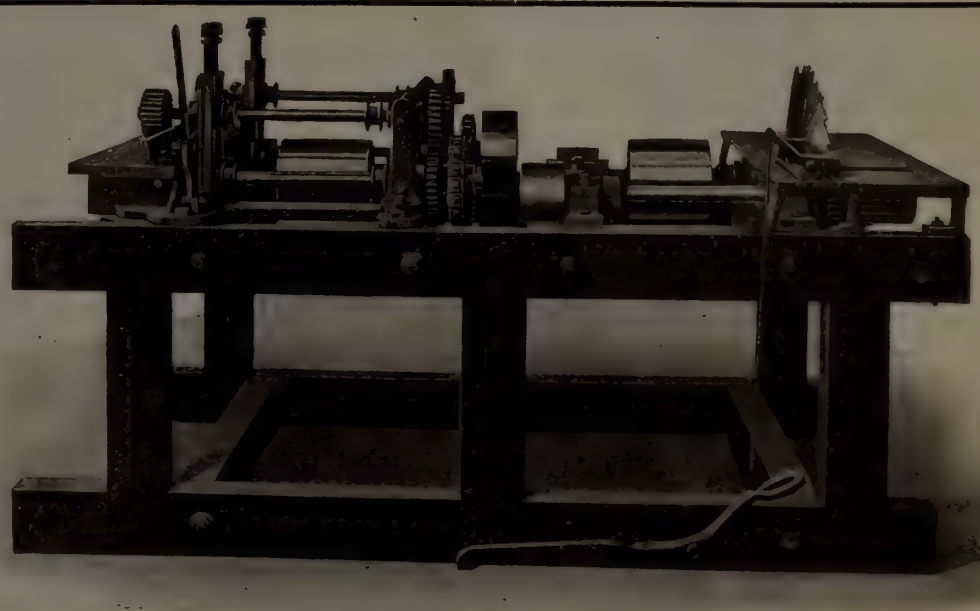
This lath mill and bolter is designed along simple lines with bolted wooden frame, making it inexpensive and substantial.

Capacity 45,000.

Specifications; Lath machine pulley 7 inches diameter x 9 inches face.

Floor space 7 feet 6 inches x 3 feet 6 nches.

We make gang edgers, shingle machines, sleeper machines and barkers, etc.



McLennan Foundry & Machine Works

CAMPBELLTON, N.B. Limited

Superiority of the Wooden Pulley

Analysis Proves It the Most Efficient and Least Expensive Type to Maintain.

Editor's Note.—The most common appliance in mills, factories, and machine shops is the pulley. Wherever belt transmission is used the pulley is in service. The cost of installing and maintaining mills where considerable machinery is employed constitutes a large per cent. of operating expenses. For that reason the pulley is of direct interest to every man who uses one or more. The article which follows was prepared by the National Lumber Manufacturers' Association, and is reproduced from the Hardwood Record.

Are you using wood pulleys or are you not? If, instead, you are using steel pulleys, you are paying some 50 per cent. more at the outset for your pulleys than if you bought wood pulleys. In this case are you getting 50 per cent. greater efficiency and durability, or are you simply favoring the steel trust with a welcome contribution, which, considering its source, it is more than glad to accept?

Wood pulleys have been on the market for over thirty years, and that is too short a time to be able to say how long they will last. Many wood pulleys built thirty years ago are still in use and as good as new. Steel pulleys have been on the market sixteen years, but owing to the inevitable crystallization to which they are subject when in service, this period has been more than long enough to demonstrate their average length of life. So much for durability and its corresponding lack in the two types of pulleys.

There is only one class of service for which a wood pulley is not suited, and that is when exposed to excessive moisture, a service in which a regular leather belt cannot be successfully used. In such service a wood pulley should not be used, nor a sheet steel pulley either. Long continued exposure to excessive moisture will cause a wood pulley to go to pieces. Moisture penetrating the riveted joints of a steel pulley cause rust and corrosion, and in a short time the joints work loose and the pulley is gone. The pulley for wet places is the cast iron pulley.

Wooden Pulleys Are Cheaper.

The following table gives a comparison in price to the user between wood and steel pulleys. Only the most popular sizes are shown, but the comparison holds equally true for all sizes:

Sizes.	Wood.	Steel.	Excess cost of steel.
6 x 3	$ 1.16	$ 1.82	57 per cent.
12 x 4	1.60	2.55	59
24 x 6	3.96	6.02	52
36 x 8	8.04	13.20	64
48 x 10	14.98	26.81	85
60 x 12	24.28	46.20	90

Iron pulleys are even more expensive. Now, if you pay that much more for iron and steel pulleys, you ought to get that much more service out of them. But do you?

Wooden Pulleys Transmit More Power.

A number of years ago Haswell, the leading American authority on mechanics, made a series of exhaustive tests of wood and iron pulleys, and the findings of these tests have never been controverted. Haswell proved that the coefficient of friction of belts running over wood pulleys was 47 and over iron pulleys 24. That is, that with the same belt tension you can transmit, even according to his conservative figures, on the average nearly twice the power over a wood pulley that you can over an iron pulley. Over a steel pulley you cannot transmit so much even as you can over an iron pulley, for steel pulleys are never perfectly round, and their faces are covered with high and low spots, so that for both reasons the belt is prevented from coming in perfect contact with the pulley face. This saving of power transmitted, rather than waste in belt slippage, is very considerable in the course of a year.

Wooden Pulleys Weigh Less.

The following table of weights is instructive, especially in view of the claims of the steel pulley manufacturers that their pulleys are light. These figures are approximate as representing several makes of wood and steel pulleys, but the ratio of comparison is correct:

Sizes.	Wood.	Steel.	Excess weight of steel.
6 x 3	1¾ lbs.	7 lbs.	300 per cent.
12 x 4	8½ lbs.	19 lbs.	124
24 x 6	31 lbs.	41 lbs.	32
36 x 8	79 lbs.	121 lbs.	53
48 x 10	155 lbs.	245 lbs.	58
60 x 12	245 lbs.	384 lbs.	57

What do you gain by putting this extra weight on your hangers and shafting? The answer is, nothing; while in addition you penalize yourself severely every minute that your hangers and shafting carry this weight, and every working minute that your engine has to turn it.

Wooden Pulleys Run True.

Trueness of running is another advantage which wood pulleys possess over steel pulleys. The latter are forced into temporary approximate roundness by dies in the course of their manufacture, but soon spring back out of this even approximate roundness when subjected to the strains and shocks of actual service. This is why you never yet saw a steel pulley in service that did not gallop or wabble or possess a combination of both undesirable gaits. Think about this. Gallowing and wobbling is destructive to belt and bad for hangers and shafting.

Wood pulleys do not crystallize even under hard service; the hardwood from which they are made offers the maximum resistance to compression, and yet has sufficient spring to relieve itself from sudden shocks.

Wooden Pulleys Make Yearly Saving.

Last year Prof. Price, of the University of Toronto, conducted a series of tests for the purpose of analyzing more closely than had heretofore been done the relative efficiency of wood and iron pulleys. His report has been published, and makes interesting reading. These tests seem to have been broad and thorough enough, and made under a sufficient number of varying conditions to be really conclusive. Prof. Price considered the subject under four heads, and so arranges his results, but it is sufficient to state that he found the wood pulley far more efficient than the iron pulley, and that, reduced to dollars and cents, you save on the average about $6 a year per pulley by using wood pulleys rather than iron ones. Had steel pulleys been used in this test rather than iron, there is every reason to believe that the showing would have been even more favorable to the wood pulley.

The interests of the steel trust and the steel pulley manufacturers are parallel, and they have doubtless been of great assistance to each other. The steel pulley manufacturers take advantage of the effect of the word "steel" on their hearers' minds when their salesmen are talking and on their readers' minds when they speak through their advertising. They harp on the alleged fact that this is a "steel age." Steel may be good in some places, but a pulley is not one of these places. The flexibility of steel, its tendency to distortion, and its inevitable crystallization make it utterly untrustworthy for pulleys.

Certainly lumber manufacturers ought to favor a product made from lumber if they sincerely believe in the merits of wood over substitutes. But, laying aside all natural bias of this sort, by using wood pulleys you are using something that has been proven more efficient, more durable, and more economical, both in first cost and operation, than either of the substitutes on the market.

Keeping Co-operative Logging Costs

By R. C. Staebner*

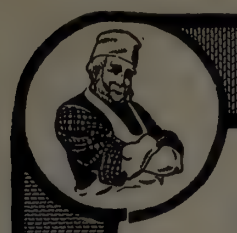
Keeping the cost of logging is, of course, necessary to the conduct of any well-ordered lumber business, for several reasons. Profitable production of any commodity can hardly be carried on without knowing what the finished product costs, and the logging costs is a large, and often the largest, expense in lumber manufacture. Moreover, a record of the logging cost is necessary to enable the manager and owners of any plant to know if their work is being done as cheaply as possible. Such records form a basis for comparing present with previous work, thus enabling one to learn the correct lessons from his own experience.

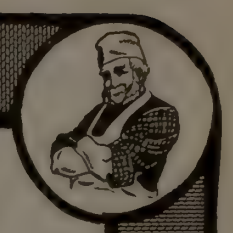
Doubtless all members of the congress keep a record of their logging cost, and probably none know exactly what it does cost nor why it costs that particular figure, because the correct determination of this requires more than a careful account of labor and supply bills. Logging any particular tract of timber is a long-time operation, and in order to determine correct annual or monthly or any other periodic costs many other factors must be known.

First of all the amount of timber on the whole tract, as well as on the different topographic logging units, must be known, in order to know the proper depreciation charge for the important item of railroad construction and other improvements which a given period of logging must bear. The average life of teams, tools, machinery, and equipment of all kinds must be accurately known for the same purpose of allotting to each period its proper charges over and above purely current items of expense. Here, also, we need to know and discount in our cost figures the probability of fires, floods, and other destructive accidents.

The proper distribution of current labor and material costs is a very complicated problem and very difficult in its practical application. On nearly every job more than one product is handled, such as logs, tan-bark, pulpwood, acidwood, ties, etc. Certain operations necessary to getting out one of these products help or hinder directly or indirectly the work on the others; which raises the question as to how

* Address delivered before Appalachian Logging Congress.





GOOD FLOUR FOR YOUR CAMP

The best economy in the world is to buy that commodity which, being good, is the cheapest value on the market. This simply means, when choosing flour, don't be altogether influenced by price, but get a wholesome, nourishing, uniform product that will bake up into appetizing food. That is why we recommend for your camp

Cream of the West Flour

The Hard Wheat Flour that is guaranteed for Bread

For years this flour has been held up as an excellent example of the "pure food" idea, and we are jealous in guarding that reputation. Your men will readily respond to your efforts in giving them good food with more work and cheerful dispositions, which means a big money saving to you.

Our horse feed is distinctly good. Bullrush Crushed Oats (best grade Western oats) and Geneva Feed (crushed oats and cracked corn) are both worthy of attention for your stable.

much of the expense of this work each should bear. For instance, shall the cost of roads over which logs, tanbark, and pulpwood are skidded be charged entirely to the logs?

It follows that a classification system must first be worked out—a satisfactory and practical separation and definition of the different items of expense that are worth keeping separately. It is easier to do this—to know what costs we want to keep separate—than it is to actually get the data for these accounts. The greatest difficulty here is to get correct and intelligible distribution in the cost reports turned in from the field, as they must usually be kept by the foremen, who often have great difficulty in keeping a simple time book correctly.

Suppose, however, that all this has been accomplished; that we have before us a correct and complete record and proper distribution of all the costs for two stated periods on the same operation. We want to learn what we can from these data—what the cost is and why; is it too large, can it be lessened, and how? Our first impulse is to compare them, item by item. But, after all, we cannot learn much from this cost sheet unless we are very familiar with all the conditions under which the work was done. Because the cost of logging depends on a great many varying factors, such as topography, soil, and rocks, species, size, and distribution of timber, character of undergrowth, weather conditions, character and efficiency of labor and supervision, efficiency of equipment and machinery, and so on. So that a higher figure now actually represent more efficient logging than the lower, because done under harder conditions.

However, such a set of cost sheets on any single operation, used with experience and judgment by men thoroughly familiar with all the conditions on that job, is undoubtedly a great aid in keeping expense in line, and the efficiency of the work where it ought to be, and is worth all it costs.

What is the cheapest and most efficient method of logging? The answer to this depends on the following points:

1. Is the actual accounting classification the same? Does every item on each cost sheet include no more and no less than the corresponding one on the others? Most likely not, as the cost accounts of the different members are at present kept.

2. Are all the influencing factors such as those outlined above, which so largely determine the logging cost, the same for all the operations? Certainly not on any two operations we know of.

If it is possible and practical for all the members of an association to adopt a uniform classification of accounts, and if every member can be sufficiently familiar with every operation, its methods and all the influencing factors, then comparative costs will be of great benefit.

One association attempts a comparative cost sheet for the whole logging operation, from the stump to the mill. This sheet requests a statement from each member as to the costs of the different items of the work, coupled with a great many specifications of the conditions and methods which determine costs. For example, character of the country, class of timber, number, rating, weights, models, etc., of the different classes of locomotives, cars, skidders, and loaders, descriptions of the track, stock, and tools, the organization of the crews and methods of doing each kind of work, the character and efficiency of the labor, and the wage scale. All this information is to be contained on a single sheet about the size of an ordinary business letterhead.

This is undoubtedly of some interest in a general way, but we do not believe it is of large practical value in the solution of the logging man's problems. In the first place, when comparing costs we do not know the exact weight to give each influencing factor, nor how to weigh justly the composite of all. Furthermore, it is doubtful if these factors can be stated with sufficient definiteness to convey a clear impression of the exact conditions.

It seems that the problem is too large to be handled in this way. There are too many difficulties to be overcome. The solution rather lies in breaking up the subject into smaller parts and tackling them one at a time, into parts so small that the influencing conditions and methods can be exactly known and measured and intelligently compared. The comparative method that will yield us the most profitable results is the one that will answer the questions. Am I doing any particular piece of work by the best method for the given conditions? If the method is correct and the costs are out of line, does the fault lie with the labor or the machinery and equipment?

We can arrive at this solution by keeping the labor and material costs on a certain phase of logging, together with an exact record of the influencing factors, then getting together and comparing our results. We advocate, then, the assignment of a meeting, or a day, to some particular phase of logging work, and going into it thoroughly in all its details, asking each member to keep the cost of all the items going into this particular piece of work, together with a careful description of the method used and exact data on the influencing factors.

The length of time such records should be kept depends on what may be termed the unit of the work. As an example, the unit for the skidder would naturally be a set, and the records should be kept from the beginning to the completion of a set, whatever the actual time may be.

For instance, a meeting might be assigned to the discussion and comparison of overhead steam skidding costs, and records kept by each member, somewhat as follows:

1. A careful description of each set, with a topographic map, if possible, and a statement of the character, size, and density of the timber and the character and density of the undergrowth.

2. The machine used, with specifications as to boiler, engines, number and size of drums, their arrangement, and cost of the machine, also the size and kind of lines used and the cost of rigging the machine.

3. Crew and wage scale, character and efficiency of the labor.

4. The method of rigging spar-trees, the type and size of blocks used, the methods of putting out and changing the lines, and the costs of this work.

5. The method of working while skidding, distribution of crew, average and maximum amounts skidded for each set, with the labor cost of the same.

6. The method of moving from one set to another, the distance moved, time consumed, and cost.

7. The amount and cost of coal, oil, waste, etc., used on each set.

8. The lost time due to weather conditions, breakdowns, etc.

9. The total amount skidded and the total amount of labor and supplies.

By keeping the cost of these items as set forth above we can arrive very closely at the actual cost of skidding for the conditions represented, except for the depreciation of machinery and wear on the lines, which can only be obtained from longer time records.

At the end of such a discussion as this, if the matter were thoroughly gone into we would have a set of truly comparative figures. Because, besides the actual cost, we would have before us the methods and conditions which determined them. The members using steam skidders would be able to judge accurately of the comparative efficiency of each method and outfit under stated conditions, and the possible improvements in the details by adoption from others. Those members not using overhead skidders should be in a position to decide correctly if they were feasible under their own conditions, and to select the best machines and methods of using them, without going through the long and expensive process of working the whole thing out by trial and error.

By going into every phase of logging work in this manner an association could gradually compile a set of intelligible and working data, which could be used to determine the best method of doing any given piece of work under any stated set of conditions.

This offers, it seems to me, the only way to profit by comparative costs, and the only chance for real advance in the science and art of logging. It is the method by which the great advances in technical processes in all modern industries have been worked out, a step at a time, by studying in detail a certain phase of a process under conditions that could be measured, disregarding for the time the other problems. It is the simplest and easiest method, and opens a way for the final solution, one at a time, of the numerous and complex problems confronting the logging man. It will bring results that we can use in our daily work. It is practicable, and does not entail a rigid system of keeping accounts. It can be gathered as our daily work progresses, and without an undue amount of extra work nor a disturbance of our regular accounting system. Finally, the real problem of efficient logging is the correct selection of detailed methods for each phase of the work, which is most feasible after gathering a set of figures of this sort.

Robert Dollar Interests to Centre at Vancouver

Mr. Robert Dollar, owner of the Dollar Steamship Line, was recently in Ottawa, and from there proceeded to Vancouver. He has announced definitely that he will, in the near future, commence the construction of a large sawmill on Burrard Inlet and that Vancouver will be made the headquarters for his great line of steamships. It is reported also from Vancouver that he has purchased the sawmill at Ruskin, B.C., which formerly belonged to the E. H. Heaps Lumber Company, Limited. This plant has a daily capacity of 100,000 feet of lumber and 500,000 shingles.

Lieut. George E. Bothwell Killed

Lieut. George E. Bothwell, formerly in the employ of the Forestry Branch at Ottawa, is reported as having been killed at Courcelette. At the recent meeting of the Foresters' Club the president, Mr. R. H. Campbell, reported that the manner in which Lieut. Bothwell met his death was as follows: After a successful charge, Lieut. Bothwell's unit was rounding up a party of German prisoners who had surrendered in a dugout. One of the prisoners retained possession of a revolver, and when Lieut. Bothwell's back was turned shot him through the back of the head, and he died instantly.

According to estimates recently made, it now costs 40 per cent. more to construct a wooden vessel at Canadian Atlantic ports than it did five years ago.

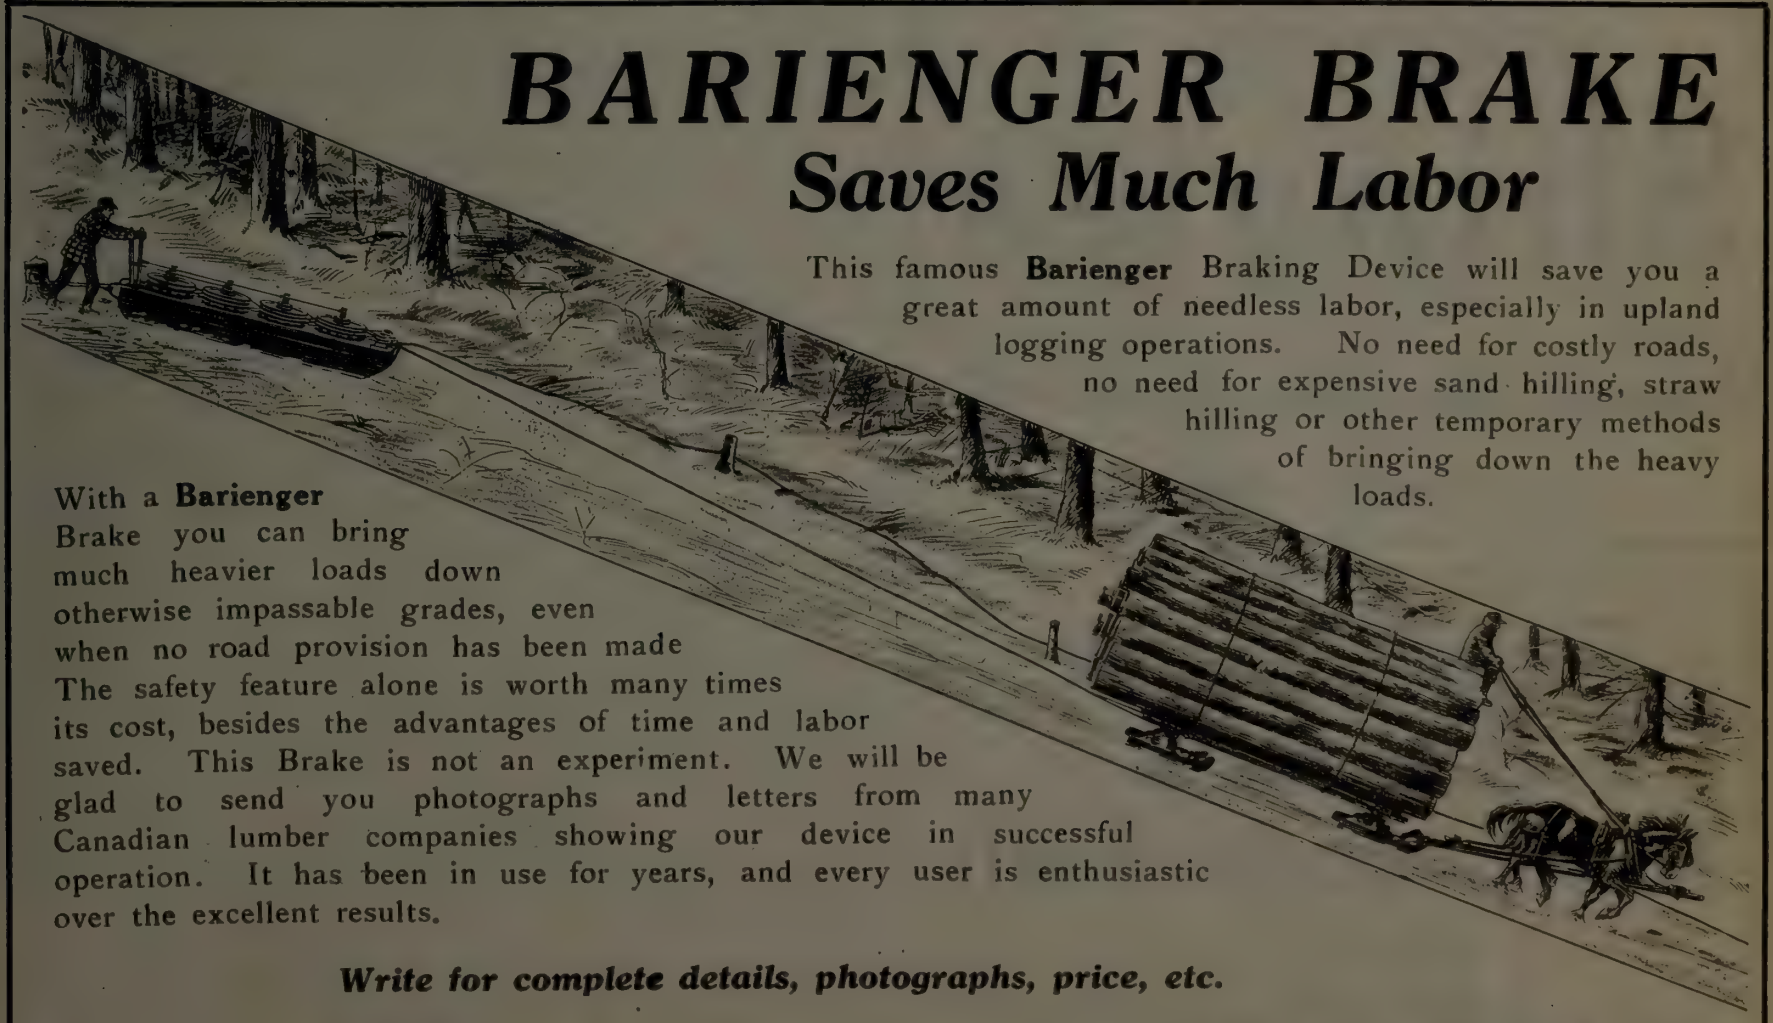
BARIENGER BRAKE
Saves Much Labor



This famous **Barienger** Braking Device will save you a great amount of needless labor, especially in upland logging operations. No need for costly roads, no need for expensive sand hilling, straw hilling or other temporary methods of bringing down the heavy loads.

With a **Barienger** Brake you can bring much heavier loads down otherwise impassable grades, even when no road provision has been made The safety feature alone is worth many times its cost, besides the advantages of time and labor saved. This Brake is not an experiment. We will be glad to send you photographs and letters from many Canadian lumber companies showing our device in successful operation. It has been in use for years, and every user is enthusiastic over the excellent results.

The Michipicoten Power and Paper Company, Limited, has been incorporated with capital stock of $6,000,000 and head office at Toronto, Ont.

A site has been chosen for the erection of a pulp mill at Arnprior, Ont. The name of the owner has been withheld. For further information address Deputy Reeve Havey, Arnprior, Ont.

Excavating work has been commenced for the erection of a woodworking shop to cost $3,000, for A. L. Voege, 40 Regent Street, St. Thomas, Ont. The building is to be one storey, white brick construction and maple and pine floors.

A planing mill to cost $10,000 will be erected at Chatham, Ont., by C. & J. Hadley, Company, 58 Thames Street. The manager is Mr. J. M. Diver. The owners are purchasing lumber, electric supplies, etc. They have some of the machinery now on hand.

The Hope Lumber Company, Thessalon, Ont., closed their mill for the season about the end of November, and many of their employees left for the lumber camps. The company contemplate a number of important improvements to their plant during the present winter.

The Stone Lumber Company, Limited, Marksville, Ont., report that they expect to take out 1,500,000 feet of birch and maple logs during the present winter. This will be half a million less than their cut last season, but labor conditions and other uncertainties make it inadvisable to operate as heavily as formerly.

The Keenan Woodenware Manufacturing Company, Limited, Owen Sound, Ont., will erect two buildings, as additions to their factory, each to be two storeys, 60 x 120 feet. One will be built in 1917 and one in 1918. A by-law granting a loan of $20,000 for this work will be voted upon by the ratepayers of Owen Sound in January.

The Turner, Day and Woolworth Handle Company, 1217 South Seventh Street, Louisville, Ky., have leased a large factory in Hamilton, Ont., for the purpose of manufacturing all kinds of hickory handles. The machinery for the plant is already en route. At the commencement, the company will employ about 25 men for two or three months, the number to be increased later on.

The Lazier Paper Mills Company, Limited, have been incorporated, under Dominion charter, with head office at Montreal and mills at Belleville, Ont. The capitalization of the company is $150,000. It will acquire as a going concern the property and business of the Lazier Paper Mills, Limited, Belleville, Ont., and will increase the equipment, so as to add to the output of the plant.

The Schroeder Mills & Timber Company, of Milwaukee, Wis., have purchased from the Victoria Harbor Lumber Company, Limited, of Toronto, timber limits covering 138 square miles in the townships of Blair and Mowat, Parry Sound District, Ontario, Canada. It is the intention of the Schroeder Company to take out about twenty-five million feet of white pine from these limits each season, beginning next autumn. The timber will come out by way of the Pickeral and French rivers, although some may be handled by rail.

Tenders are being received until 4 p.m., December 22nd, by R. C. Desrochers, Secretary Dominion Government Department Public Works, Ottawa, for British Columbia fir timber and for white oak timber to be used in construction of dredge No. 125. Specifications may be seen at the office of district engineers, Shaughnessy Building, Montreal, and Equity Building, Toronto, or may be had from the mechanical superintendent, Birks Building, Ottawa, or at the office of MacLean Daily Reports Ltd., 345 Adelaide Street West, Toronto.

Laurie H. Burnaby, manager of the Burnaby Lumber Company, Toronto, has accepted a position as manager of the Argo-Summit Lumber Company, retail lumber dealers, Chicago, Ill., and will leave to take up his new duties early in January. The business of the Burnaby Lumber Company, Toronto, is being closed up. Practically all of the stock has already been disposed of. The Argo-Summit Lumber Company operate two yards in Chicago and Mr. Burnaby will be in charge of all their business. Previous to moving to Chicago, Mr. Burnaby will make a pleasure trip during the Christmas holidays to New Brunswick.

Eastern Canada

The Samara Pulp Company, Limited, have obtained a charter with head office at Montreal, P. Q., and power to manufacture, import, export and deal in pulp and pulpwood paper products.

Messrs. Murray & Gregory, St. John, N.B., who lost their mill at Lac Frontier, Quebec, by fire on November 9th, are rebuilding and will have the mill in operation by the middle of May of 1917. The new mill will be a duplicate of the one destroyed.

The business formerly carried on by the late Mr. E. T. Nesbitt at Limoilou, P.Q., will be continued in future under the name of E. T. Nesbitt Reg., and will be in charge of the executors of his estate, in accordance with the terms of

his will. Mr. Louis Hamel, who was in the late Mr. Nesbitt's employ for many years, will be manager.

According to reports from Newcastle, N.B., Mr. J. D. Volckman has made arrangements for the construction of a large pulp mill on the site of the plant of the New Brunswick Pulp and Paper Company, Limited, at Millerton, N.B., which was recently destroyed by fire.

The Nashwash Pulp & Paper Company, who have purchased the Ed. Partington Pulp & Paper Company's limits and mills, will build a large brick wood room near the pulp mill at Union Point, St. John. Work is now going on, and it will be ready for occupancy about May 1st, 1917.

The sawmill belonging to Ralph D. Wanamaker, about a mile and a half above Nauwigewauk, N.B., was destroyed by fire on December 3rd, the loss being between $4,000 and $5,000. No insurance was carried on the plant. A large quantity of lumber piled in the yard was saved.

The E. Burtt Lumber Company, Limited, has been incorporated with capital stock of $20,000, and head office at Burtt's Corner, N.B. The company is empowered to take over the lumber business formerly carried on by Elwood Burtt. The members of the new company are Elwood Burtt, Roy E. Burtt and S. Howland, all of Douglas, N.B.

The Carthage Sulphite Pulp and Paper Company, Carthage, N. Y., report that the timberlands purchased by them recently in Quebec province, between Murray Bay and Tadusac were secured as a partial source of supply for their pulp and paper mills. They do not contemplate the erection of any mills on this property at present. The purchase includes 80,000 acres of timberlands, estimated to contain 800,000 cords of pulpwood. The price paid was between $250,000 and $300,000. Pulpwood operations are now being conducted on this property for the purchasers by the Provincial Industries, Ltd., of which Ovide Brouillard is manager.

Geo. A. Chappell and his son Claude C. Chappell, Amherst, N.S., under the name of Chappell and Son, report that the timber lands which they recently purchased from W. F. Beatty are located on Second River, which flows into River Philip. The limits contain 2,300 acres, chiefly spruce, but also a quantity of fir, maple and birch, the total being estimated at about 20,000,000. They are logging on the property this winter and already have a mill operating. They expect to cut about a million and a half feet of spruce this winter which will be hauled out to Thomson. Next summer they intend to clear the river for driving operations.

The control of the Ticonderoga Pulp and Paper Company, Ticonderoga, N.Y., has been purchased by the Riordon Pulp & Paper Company. The Ticonderoga Company manufacture about 100 tons of soda pulp and fine book and specialty papers per day. The directors of the company are: Messrs. Charles Riordon, Carl Riordon, F. B. Whittet, Lawrence Macfarlane and T. J. Stevenson, of Montreal; George E. Challes, of Toronto; T. E. Warren, Ticonderoga, N.Y.; C. S. Merrill, Albany, N.Y., and Allen Curtis, New York city. The new officers of the company are as follows: Messrs. Charles Roirdon, president; Carl Riordon, vice-president; F. B. Whittet, secretary and treasurer; T. E. Warren, manager.

Western Canada

Councillor Williams, Langley, B.C., is making arrangements for the erection of a shingle mill and sawmill at Jardine, B.C.

The Western Lumber Company, Saskatoon, Sask., are contemplating the erection of a sawmill to be ready to saw about January 1st, 1917. Mr. C. R. Hill is manager for the company.

The Namu Box Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $24,000, to carry on business as timber and lumber merchants, sawmill proprietors, etc.

The Davis Logging & Trading Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $50,000, to carry on business as loggers, timber and lumber merchants, sawmill and planing mill proprietors, manufacturers of wood pulp, etc.

The Iowa Shingle Company, Limited, has been incorporated with head office at Vancouver, B. C., and capital stock of $10,000, to carry on business as lumber and timber merchants, sawmill and shingle mill proprietors and as manufacturers and dealers in lumber and timber of all kinds.

The Straits Lumber Company, a United States concern, has secured the large mill at Nanoose Bay, B. C., which was closed down some months ago. Operations will be commenced immediately. A. H. Cramer will manage the manufacturing end of the business, and already has men at work overhauling the mill.

Sealed tenders are being received by the Minister of Lands for the province of British Columbia until the 10th day of January, 1917, for the purchase of License X719 to cut 7,230,000 feet of dead and down cedar and 1,000 cords of shingle bolts on an area adjoining Timber Sale X538, Powell Lake, New Westminster District. Three years will be allowed for the removal of the timber.

J. D. McArthur, McArthur Block, Winnipeg, Man., is negotiating with the city of Winnipeg for power and water to be used in connection with a paper mill of which he is contemplating the erection. The capacity of the proposed mill is to be fifty tons per day. It is also likely that the plant will include machinery, for converting waste paper into wrapping paper. The plant will give employment to about five hundred men.

The Model House

will not stay model long if inferior, unseasoned lumber has been used in its construction. It will retain its beauty and serviceability for untold years if built with such lumber as we furnish. Isn't it better to build so that you'll have a house that will last for years without repairs rather than one that keeps on costing all the time.

They Saved 25% in Fuel and 50% in Repairs

SO WRITES Mr. Wm. H. Turner, secretary and treasurer of **The Easton Furniture Company**, of Easton, Md., after giving the "Morehead" system a thorough trial.

Until you are draining the condensation from your kilns and returning it—every drop—to the boilers at the **original temperature**—

—you are wasting heat units that **cost** you DOLLARS to produce.

STOP THAT WASTE!

Rejuvenate your entire steam plant by making the inexpensive "Morehead" system a part of it.

Save **fuel** by bringing the pure condensation directly back to the boilers HOT!

Save **repairs** by eliminating forever the necessity for the wasteful and constantly out-of-order steam pump. The simple, easily installed "Morehead" system will much more than pay for itself the first year of use.

Write for the proof to-day.

The "Morehead" book shows actual photographs of some interesting installations. Don't you want your copy at once?

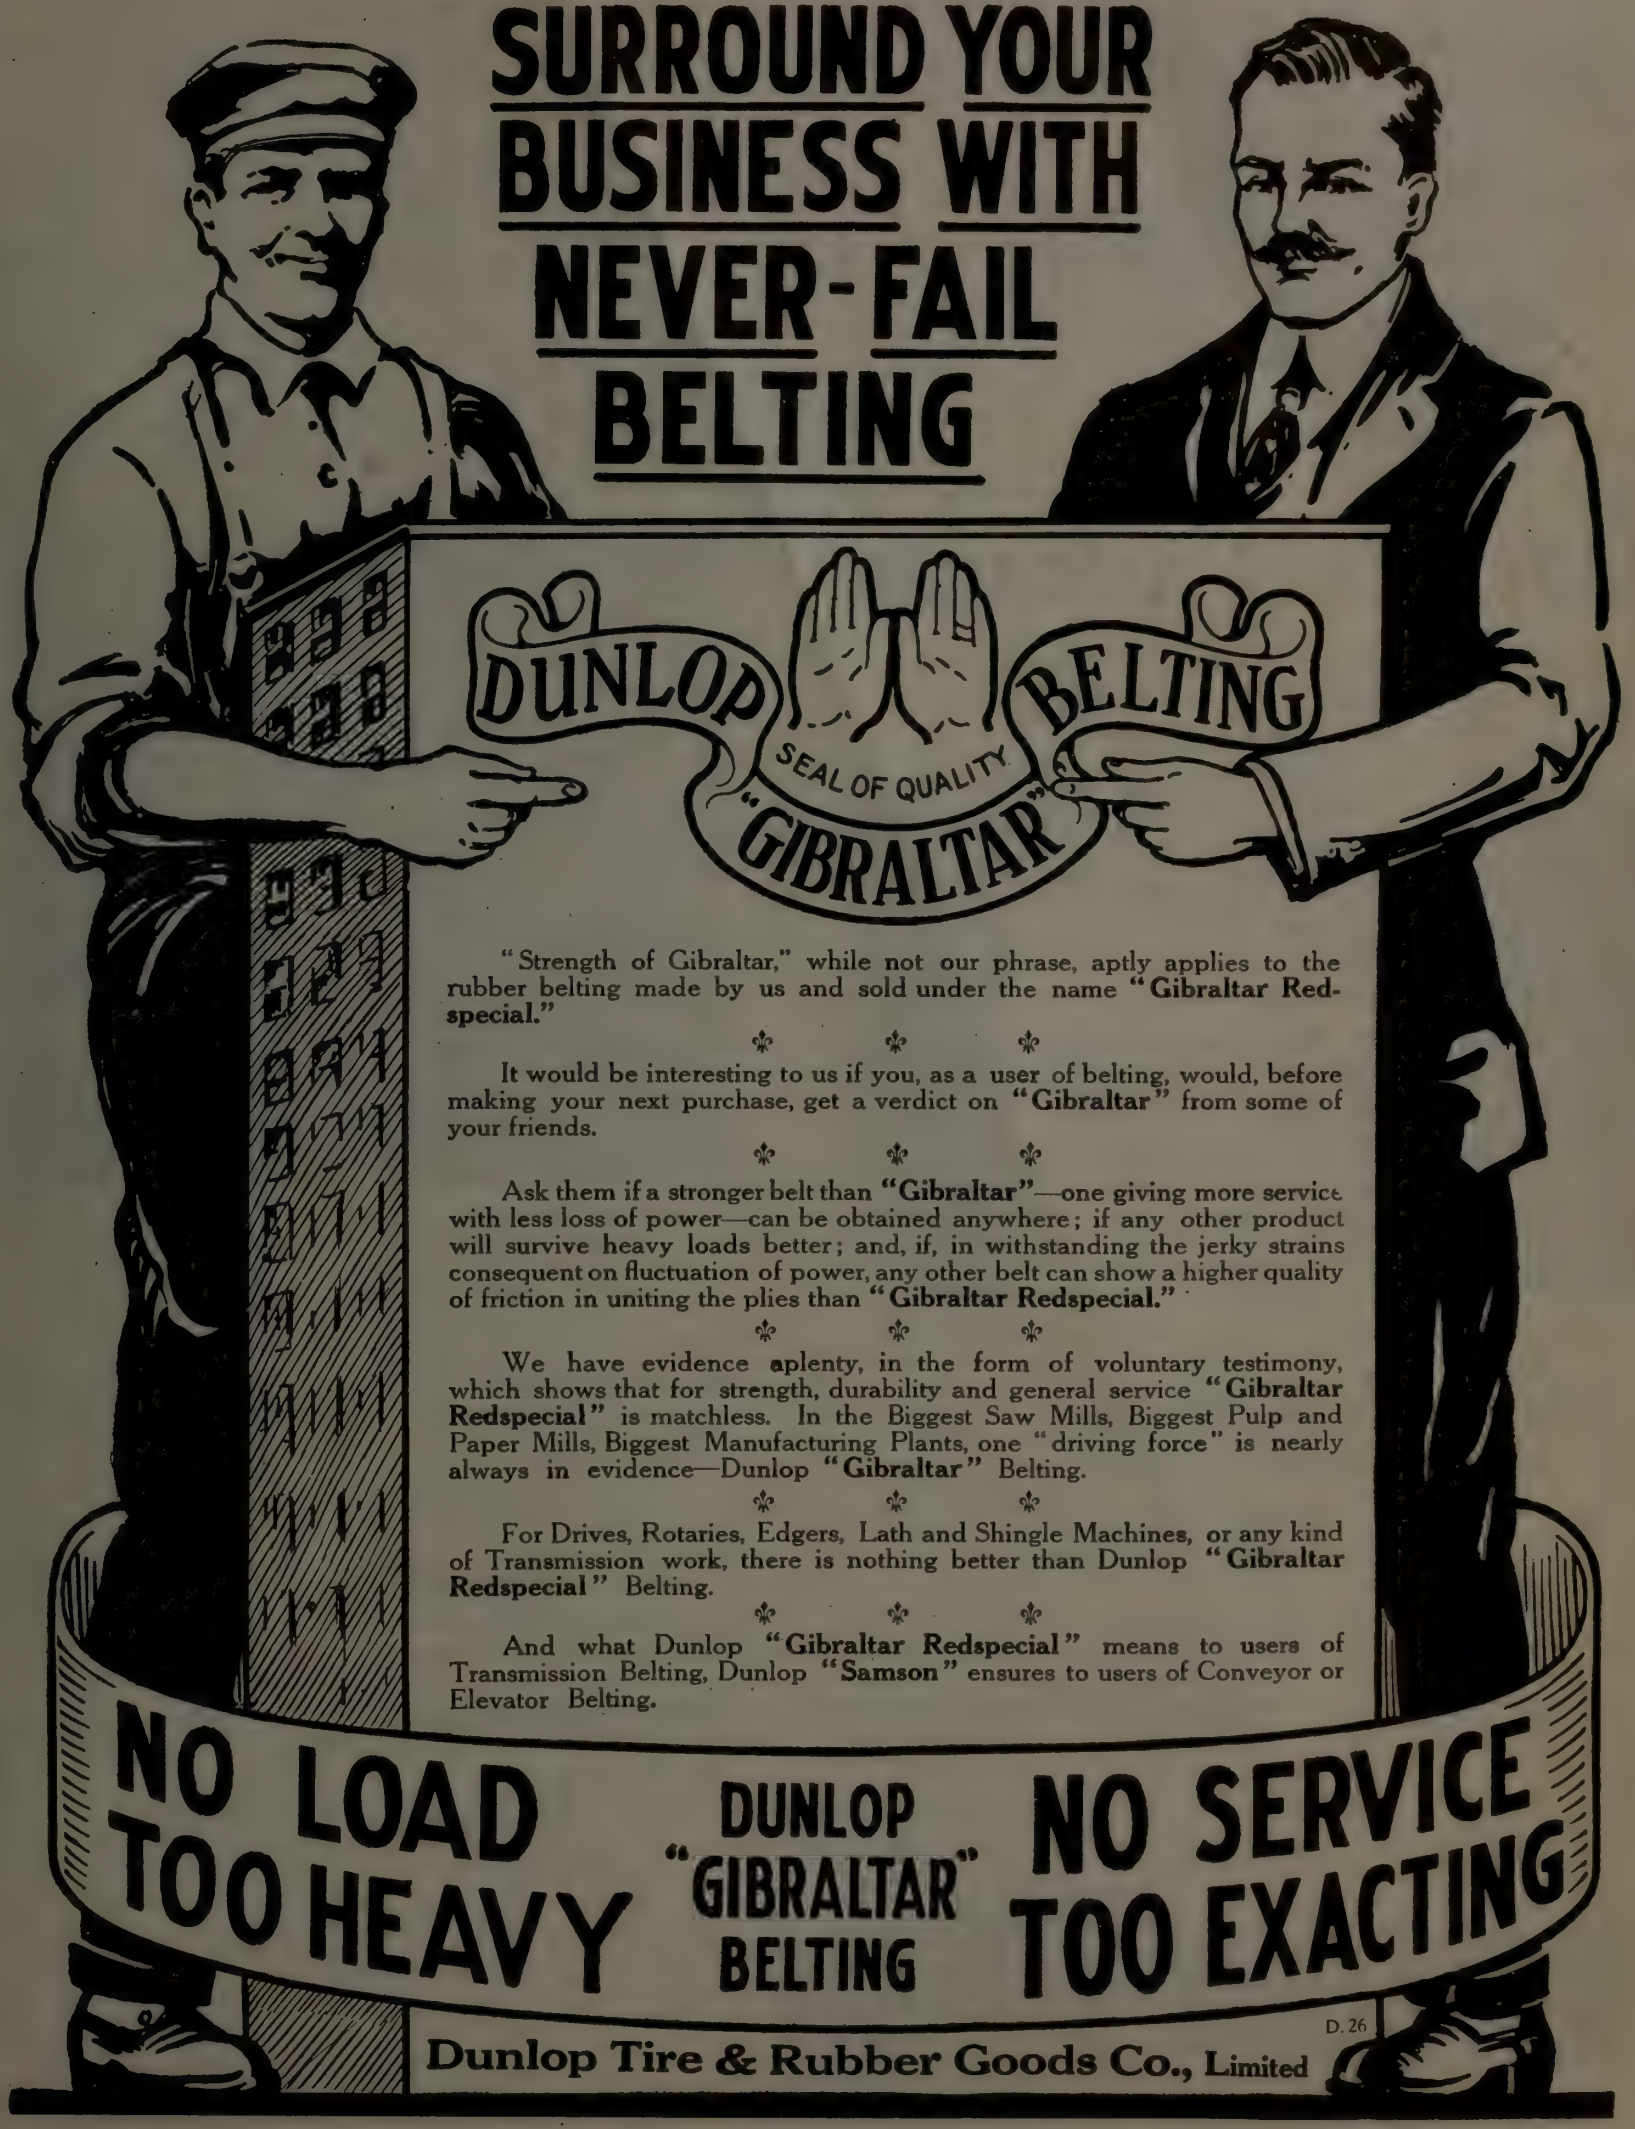
SURROUND YOUR BUSINESS WITH NEVER-FAIL BELTING



"Strength of Gibraltar," while not our phrase, aptly applies to the rubber belting made by us and sold under the name **"Gibraltar Redspecial."**

⚜ ⚜ ⚜

It would be interesting to us if you, as a user of belting, would, before making your next purchase, get a verdict on **"Gibraltar"** from some of your friends.

⚜ ⚜ ⚜

Ask them if a stronger belt than **"Gibraltar"**—one giving more service with less loss of power—can be obtained anywhere; if any other product will survive heavy loads better; and, if, in withstanding the jerky strains consequent on fluctuation of power, any other belt can show a higher quality of friction in uniting the plies than **"Gibraltar Redspecial."**

⚜ ⚜ ⚜

We have evidence aplenty, in the form of voluntary testimony, which shows that for strength, durability and general service **"Gibraltar Redspecial"** is matchless. In the Biggest Saw Mills, Biggest Pulp and Paper Mills, Biggest Manufacturing Plants, one "driving force" is nearly always in evidence—Dunlop **"Gibraltar"** Belting.

⚜ ⚜ ⚜

For Drives, Rotaries, Edgers, Lath and Shingle Machines, or any kind of Transmission work, there is nothing better than Dunlop **"Gibraltar Redspecial"** Belting.

⚜ ⚜ ⚜

And what Dunlop **"Gibraltar Redspecial"** means to users of Transmission Belting, Dunlop **"Samson"** ensures to users of Conveyor or Elevator Belting.

The "Clark" Single-Table Horizontal Resaw

Ever Consider Why These Machines are so Popular?

The possibility for fast and accurate production—is the answer

Some of the special features of the "Clark" Horizontal Resaw are—

The method of returning stock through machine, eliminating expensive return system—The use of the lower part of saw blade, this means the resaw sets on mill floor where every part is accessible. Entire table twenty-four feet long raises and lowers—Elimination of sawdust around wheels as all dust and bark passes through frame to conveyor below. Hand or Steam Set-works—Range of thickness from ½ in. to 14 in., made in two sizes, 66 to 84 inches.

Many other special features are described in our Resaw catalog. Mailed on request.

We will introduce Jan. 1st our New Portable Band Mill complete. If interested write us for Catalogue.

"Leather like gold has no substitute."

Made in Canada

for 40 Years

"AMPHIBIA"

The Waterproof Wonder

Amphibia is more than a waterproof leather belt—it is really a waterproof wonder. In the saw mill where rough, wet, oily conditions prevail and often frost, you will find Amphibia the ONE belt that can "make good."

The leather used is specially tanned from choice hides and manufactured into belting with waterproof materials.

Try a sample run of Amphibia belting on the toughest run in your mill—the result will make you our customer.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Department of the Interior, Ottawa, Deputy Minister.
December 20th, 1912.

How Is *Your* Work Going?

"Sit down, Thompson; how's the work going?"

"It isn't going—it's ***dragging***."

"What's the matter—men sore?"

"No! There s no complaint. Grub is good; men seem willing enough—but they don't put their heart into the work."

"Say, Thompson, why don't you get real beds for the men, ***like the one I'm sitting on?***"

"Holy mackerel! I ain't running a Ritz-Carlton Hotel at my camp."

"I don't mean brass beds and Ostermoor mattresses; I mean sanitary steel bunks ***with real springs***. They will be money in your pocket."

"You mean money ***out*** of my pocket."

"No, sir! The trouble with your men is lack of rest. They don't get a good night's rest on those hard, wooden bunks of yours that can't possibly be kept free from vermin; they can't do a day's work. Those old bunks are costing you a pile of money, because they are keeping the men from doing their best work.

"Tell you what, Thompson, rip out the old wooden shelves that your men are trying to sleep on—put in ***'Alaska' Sanitary Steel Bunks***—and you'll find that your men will turn out about 25% more work. I proved it myself, and so did Miller." (***So have many others.***)

Alaska Sanitary Steel Bunks Cost More, But are the Cheapest in the End.
It's Not Too Late to Equip *Your* Camp With Them. May We Quote You?

INTERNATIONAL

The Promoter of Punctuality

LARRY LATENESS—"I'd be out a dollar a week if it wasn't for that International."

By reminding—not reprimanding; by encouraging—not hindering; by instruction—not reproving, International Time Recorders bring your men to a realization of the importance of their minutes.

The Minutes of Your Men Mean Money to Them and You

There is no more simple or accurate method of keeping a record of the time you buy. That is why you find Internationals in the largest and smallest plants. 260 styles from which to choose. $100.00 and up in price.

Sturtevant

A Service that Others Cannot Afford

The B. F. Sturtevant Company not only builds more fans than all competitors combined but in addition offers better service to customers. For their benefit there is maintained a Research Department working specially to produce fans which will be "Better."

The Research Department is entirely separate from other branches of the business and their sole object is to develop and improve our apparatus entirely unhampered by the demands of routine or commercial work.

This constitutes a service that other fan manufacturers whose facilities and resources are much less cannot afford to give and is assurance to customers that Sturtevant Fans are of high efficiency and of good mechanical construction.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satsatisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a firebrick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco" "Elk Steel," "St Marys," "Keystone" and "Rotex"

Write for a copy of our Catalog.

"Refractory Efficiency Engineering"

"Maple Leaf" Brand

Stitched Cotton Duck Belting

A trial Belt will convince you. Write for prices and samples.

Excels all others in economy, strength, efficiency and true running, whether for transmission of power or conveying. A test recently made at McGill University, Montreal, of a 6-ply **"Maple Leaf"** belt, a light double leather, and a 6-ply rubber belt, showed that our **"Maple Leaf"** Belt stood a breaking strain 50 per cent. greater than the leather, and 25 per cent. greater than the rubber belt.

"Maple Leaf" Main Drive Belts
Are the Best on the Market

"Maple Leaf" Belt Dressing is the best for all kinds of belts

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.
Pulpwood, 246,282 cords.
Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.
For maps and full information regarding Ontario, apply to

HON. G. HOWARD FERGUSON,
Minister of Lands, Forests and Mines.

Cut Costs with Corbet Towing Machine

When you instal a Corbet Automatic Steam Towing Machine on your Tug, your Towing Line expenses cease for a number of years. What provision do you intend making for next Spring? Are you going to continue squandering good money on Manilla Towing lines, or are you going to invest in one of our Automatic Steam Towing Machines which will pay big dividends on your investment, and it will render you a service that only those who have them installed can appreciate. Now is the time to order for next Spring's delivery. Write for prices.

GOODHUE BELTING For Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

This is 1916 Not 1816

Only of comparatively late years have we of the lumber and timber industry begun to adopt modern methods. In all too many cases we have not yet begun.

The latest types of management, machinery, manufacturing methods, reclamation of by-products, merchandising and advertising still have been adopted all too grudgingly.

So in the buying, selling and estimating of timberlands the 36 years' experience of James D. Lacey & Company represent by far the most successful effort to improve on the methods of a century ago, a LACEY REPORT remains the one real guarantee of virtually accurate knowledge of stumpage values, and the International Files of James D. Lacey & Company constitute by far the greatest existing body of facts concerning timberland (both in and out of the market).

All our facilities are at your service in any timberland transaction. It often transpires that we know more about a tract of timber than the owner of it.

We should be pleased to send you our Booklet, "Pointers."

James D. Lacey & Co.

This Plymouth Transmission Drive

has been in steady use for six years in a certain New Hampshire lumber mill. From each December to the following June or July it has been run **night** and day. There are 18 ropes. The sheaves are 11′ and 5′ 6″ diameter and their centres 72′ apart. The engine generates 700 H.P.

Plymouth Manila Transmission Rope gives service of this sort because it is made **correctly** from **fiber of superior quality.**

We also manufacture Plymouth Manila Rope for general lumbering use, Plymouth Manila Mill Carriage Rope and Plymouth Sisal Lathyarn—the most satisfactory and economical tie yarn on the market to-day.

Put your cordage problems up to us. We have specialized at this business since 1824.

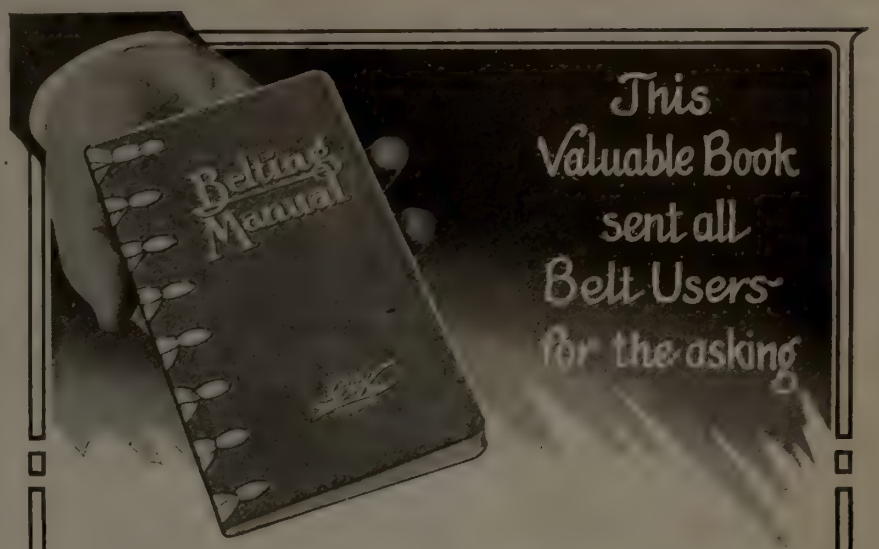
3 St. Nicholas Street - MONTREAL, QUE.



THE BELTING MANUAL, a hand book of 96 pages, substantially bound, is the most complete and concise book published on belt transmission. It tells

—how to select belting.
—how to install, lace and care for belting.
—how to make belting endless on the pulleys.
—how to find the width, speed and horse-power of belting.
—scores of other "hows" which are constantly coming up in your Power Transmission problems.

We want to send a copy of this book to every Mill Manager, Superintendent, Purchasing Agent, Foreman, Master Mechanic, Engineer or others who are actually responsible for the selection, installation and up-keep of belting equipment.

If you haven't a Belting Manual write us on your business stationery and a copy will be sent by return mail.

The Wheels That Hold Their Place In the Saw Mill

SAW Gumming Wheels that hold their place in the saw mills must cut clean, fast and cool. They must stand up to their work, hold their shape; show long life—they must not draw the temper or case harden the saw tooth, and they should be uniform in grit, grade and shape.

Aloxite Saw Gumming Wheels hold their place in the mills

And in the filer's estimation.
A trial wheel will prove.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

No. 3 Lath Machine

For the mill whose requirements call for an enormous output, we recommend our No. 3 Lath Machine.

Designed primarily to work in conjunction with our No. 4 and No. 3 Bolters. The well known capacities of these Bolters, both in quantity and quality, will give you an idea of the product turned out by our No. 3 Lath Machine.

Covering a period of years, we have placed these Lath Machines in all parts of Canada.

The reputation they have established has led to repeat sales in the majority of cases where increased capacity was desired.

Simple in construction, strong in frame and bearings, with all parts easily accessible for adjustment, our No. 3 Lath Machine is without doubt the leader in this field.

Floor space, 4 feet by 4 feet 6 inches.

Weight, 1,600 pounds.

Maximum power required, 15 H. P.

Waterous Carriages

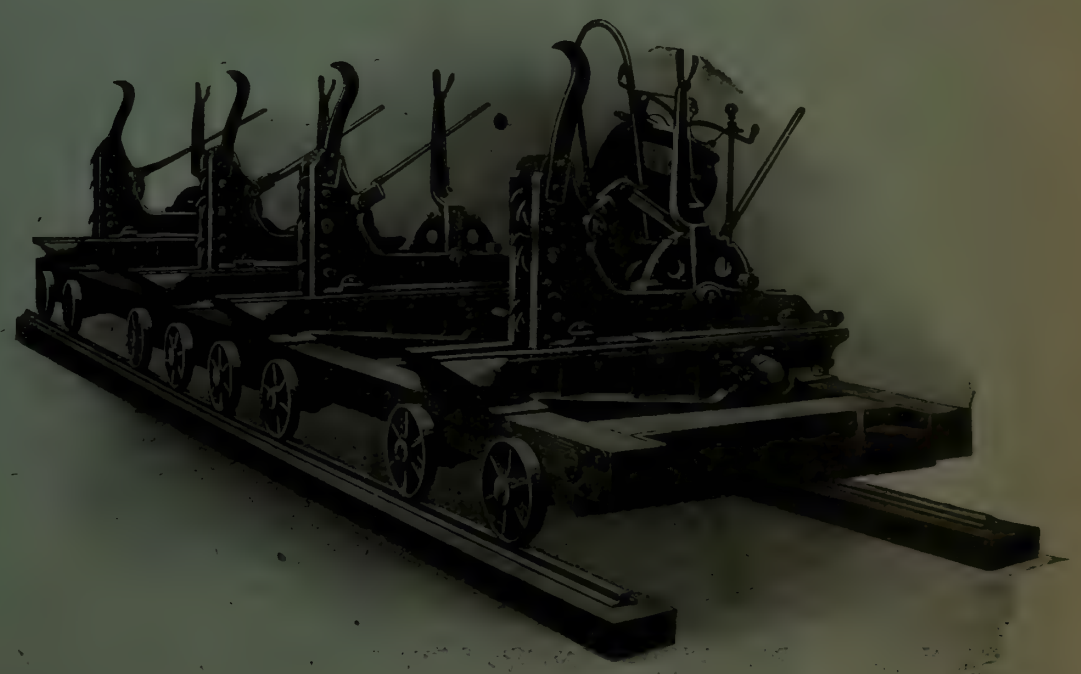
Steel Girder and All-Steel—For Every Size Mill

We build Saw Carriages.

Double Girder Carriages
With log openings of 24 in. to 50 in.

All-Steel Rack Carriages
With opening 36 in. to 72 in.

All Steel-Screw Carriages
With openings 60 in., 72 in., and 84 in.



No matter what size your mill or what kind of logs you are handling we have the right carriage for your use.

Our carriage equipment is of the very best. Waterous Dogs will hold the logs in place to stay; Waterous Setworks are accurate and durable; Waterous strength of construction will hold the carriage up to its work under the rack and wear of severe usage longer than most makes.

worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb.**, Fort William and East; West of Fort William **35c per lb.**, delivered nearest railway station: packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our FAULTLESS BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.
